GIANT CIRCUMSTANCE.

By JOHN OXENHAM, Author of *Barbe of Grand Bayou, Bondman Free, John of Gerisau,* &c.

CHAPTER I.—ARMS AND THE MEN.

THE thermometer on the tent-pole had crept up to one hundred degrees, in spite of the fact that every flap that could possibly obstruct any wandering breath of air was braced hopefully as high as it would go.

A long, slim youth, with hair like a well-worn tooth-brush, and a moustache which looked crisp and white under his sun-reddened nose, hotched restlessly on a wooden chair under the front screen. He wore a pair of loose yellow riding-trousers and a shirt very much open at the neck. In front of him was a small wooden table spread with papers, at which he glanced now and again distastefully. With evident effort he would make a perfunctory hieroglyphic, and then gaze at it doubtfully until his eye wandered off to the more tempting view outside: the long blue reach of Nile, the filmy, blue heights in the distance, and a few black cast-iron palm-trees here and there; nearer, a clump of fluffy yellow flowering mimosas and some patches of coarse yellow grass, and half-a-dozen tents, no longer white, but still looking white against the yellow sand; farther away, a number of straw *tukls*, all asleep and apparently slightly drunk in the midday heat; and over all a thin, burnt-out, blue-white sky.

Inside the tent was another wooden table, and another wooden chair, and another young man. In appearance he was not unlike the first, and was similarly clad with a single eye to such comfort as lack of attire might induce. He was of darker complexion and still more sunburned. In fact, his nose was a sight to look upon; but as most other noses thereabouts, except indigenous black ones, were in no better case, it attracted less attention than did his companion's more recent importation.

The most striking difference between them was that Number Two was working at the papers in front of him, working hard and without a pause. When he raised his head now and again, it was not to look out over Nile and dancing desert and inebriated *tukls*, but to gaze thoughtfully at the dingy canvas of the tent, and through it, with his mind's eye, at long lines of communication, trains of bobbing camels, patient donkeys, and mendacious and evasive drivers; and, more pleasantly still, at the prospect of an early move forward and the possibility of getting at last within striking distance of the elusive enemy.

Just now and again, by way of relief, his eye fell on the young man in the front door, and then it gleamed between amusement and annoyance.

'Challis, my dear,' said the lazy one, throwing back his head with a yawn, which enabled him to read the thermometer on the tent-pole without getting off his chair, 'do you know who it was invented figures? It was the devil, no less. Half the troubles of life come through figures. Now, isn't it so? Male figures that you don't like, female figures that you do like, and the usual devil-possessed figures that refuse to come right and are somehow always against you. My brain is getting perfectly addled. Can you tell me for certain what two and two make?'

'They used to make four,' said Challis, with a smile. 'But it depends to some extent on circumstances and the person'——

'There you are, you see! The devil's in the figures. They're as tricky as those blue-jowled fellows who run the *café* down at What's-its-name. My throat feels as long as a camel's and as dusty as the desert. Now, what I would like at this present moment—*H-p-p-p!*'—with a long-drawn, supping inspiration—'would be a glass of lager—iced lager, two yards long, just about as long as my throat. Think of it, Challis, my dear!—six feet of iced lager! A-a-ah!' and the thought of it came near to sending him over on to his head.

'A cup of hot tea would do you more good, as a start anyway.'

'Don't mention it, my dear. Iced lager is the only cure for a thirst like this—six feet of it on end,

[*All Rights Reserved.*]

not an inch less. Can't you just feel it trickling, trickling, trickling slowly down over the sand-banks, and gradually spreading out below, and moistening and softening all the dry and thirsty land inside?' And he licked his cracked lips at the mere thought of it. But the other was busy at his papers again, and paid no heed to his companion's maunderings.

'Challis, my dear, you lack imagination!' broke out the thirsty one, leaning over again and looking across at his friend upside down, 'you are degenerating into a machine. Figures are becoming a monomania with you. I woke once in the night, and, unless I am mistaken, you were sitting at that identical table, or else at this one—I'm not sure which—and you were scratching away just as you are now. I thought you probably had nightmare and it might be bad to wake you too suddenly, and then I went to sleep again before I had decided whether to wake you or not. Your brain will give way if you work it too hard in this climate.'

'There'll be one brain left intact, anyway; and if some one's brain doesn't work some other ones' stomachs will go empty, and there'll be no fight in them when the time comes.'

'Ah!—when. Will that dear, good time ever come? Is there any enemy, or is he a mirage like that one out yonder?'—as he came right-side up again and caught the sheen of distant water out in the desert where no water was.

'Oh, he's there right enough. Wait till you get a jab with one of his paddle-headed spears, my son, and you won't find any mirage about him.'

'I'd welcome the chance. I'm sick of sitting still and doing sums. I never could do sums, anyway. I came to fight. This isn't fighting.'

'It's the way to fight if you want to win, my boy. The desert is a mighty sight harder to fight than the dervishes;' and Challis sighed slightly at sight of all the papers in front of him.

'The desert we see, however,' said the other, rocking his chair on its hind-legs, with one hand on the table, 'and so we'—and he smiled at the pronoun in spite of his weariness—'can tackle it. But the dervishes we do not see, and so we cannot tackle them.'

'We'll tackle them all right in time.'

'Please God!' said the other lightly; and just then another young fellow, in the accepted costume, came round the tent with a handful of papers, and glanced at the littered table in the doorway as he passed inside.

'Thanking God you've got it all done?' he asked, with a grin. 'So is Challis, I expect.—Here you are, old chap,' as he handed the latter his handful. 'Chuck us another bundle. I'm as fresh as a turtle-dove, and you look like boiled owl.'

'Thanks, Cameron. That's a help. I'll manage the rest all right. If you'll give Smith a hand for five minutes he'll be obliged. He's struck some snag. Two and two, I believe.'

At which Smith laughed out and brought his chair down on all-fours.

'Come on, Cammy dear,' said he, 'and we'll polish this lot off in no time.'

'The sooner the better,' said Challis. 'The chief's waiting for them.'

'Confound the —— reports!' said Smith softly as Cameron swung up a chair and grabbed a pen.

While they finish off the papers we can get somewhat closer to them.

And to go in strict order of precedence:

'Smith.'—His Highness Prince George Adolphus Leopold of Saxe-Hohenburg-Eisenach, nominal heir-apparent to the titles, rights, revenues, and kingdom of his ancestors, presently occupied and enjoyed, all except the titles which produced nothing, by usurping Prussia for contumacy in the dolorous year '66, and held by her till said contumacy should be purged. And as the Hohenburg-Eisenachs hated the very name of Hohenzollern, Prussia's tenure seemed fairly secure and safe from disturbance. Of course, if any internal troubles should come to upset the family tea-party, honest men might come by their own again. And so the Hohenburg-Eisenachs lived comfortably enough on their not inconsiderable savings, chiefly in England, where by Court and society they were held in high regard, and waited patiently for the better times.

Prince George must, of course, prepare for a military career. He passed through Woolwich with such credit as a naturally easy-going disposition would permit, joined the Royal Artillery, and was looked upon as a young man with a future, since the future was packed with possible down-settings and upraisings if anything should happen to the tea-party, as seemed by no means unlikely.

Prince George was pre-eminently a young man of action. He would any day sooner do a thing than think about it, if it needed anything at all abstruse in the way of study. He was also a thoroughly good fellow, on the best of terms with himself and the rest of the world. He was in the habit of being affianced by the society papers to some princess or other every second week or so, and rather tired of it and the inactivities of life in the higher social altitudes.

When this particular up-Nile expedition was under way he begged an appointment and was promptly refused, the commander-in-chief at home seeing nothing for him to gain by it except experience, and everything to lose, especially his life, which under the circumstances possessed a quite extrinsic value. For desert and dervishes are no respecters of persons, and would gobble him as readily as the smallest bugler; and buglers are much more easily replaced than princes.

By dint of more importunity than he had ever shown in the acquisition of book-learning, however, the young man at last got his way, and was allowed to follow the expedition with the honorary rank of captain, on the distinct understanding that he kept out of mischief and confined his activities to observation of the processes of war from a safe distance.

He would have pledged himself to blacken his

face and wear a *jibbah* in order to escape the London leading-strings, and the way he covered ground till he reached headquarters spoke well for his energy when his heart was set on a thing.

When the chief of this particular section of the advance, to whom the head-over-all had calmly allotted the new-comer, heard of his impending arrival, he metaphorically tore his hair—it was too short and bristly to offer much of a grip—and asked high heaven what he had done to deserve this. And his subs, not being angels, though most excellent fellows, and not having his complete biography before them, were unable to answer him, but suggested that the young man was a decent kind of chap, and might prove less troublesome than was naturally to be expected under the circumstances. Upon which the unfortunate man eyed them haggardly, and asked if it was not enough for one man to be burdened with them and all the other unknown quantities of the expedition without having this last straw thrown upon his shoulders. And he proceeded solemnly to curse all things in heaven and earth and in the waters under the earth, all on account of the eager-faced young man who was hurrying to his welcome as fast as camels, horses, mules, donkeys, and expletives in several languages could compass it.

For of all abominable and detestable things to a busy and burdened man, an ornamental is the worst; more especially an ornamental of value—of value, that is, in the eyes of his high-well-born relatives, and therefore impossible to be quietly shelved and got rid of; and probably of still greater value in his own eyes, and therefore likely to be offensive in everybody else's.

The chief's temper, raw already with too much sand and too little water, too many loads and too few camels, too much desert and too little dervish, became as ragged as that of the most ill-conditioned, hump-backed lip-waggler in his pack-train, and any man who has ever had personal dealings with 'the devil and an ostrich and an orphan child' in one camel-skin knows what that means.

Nevertheless, when the young man sailed gaily in on them on a swift dromedary, and cast off his bandages with a sigh of relief, and asked first if he was in time for the fighting, and then for a drink, that remarkable man the chief, having had time to formulate his plans, greeted him with affectionate warmth, and inquired about his august relatives and the incidents of his journey, as if he were really glad to see him.

And the very first night at mess, when some one tuftily inclined—young Bittrell, I think, whose father was a wealthy brewer and had just been raised to the peerage as Lord Bercasker—addressed the new-comer by his title, he beat it out of sight with an energetic hand, and asked, 'Is there any one here of the name of Smith?' whereupon they feared the sun had got into his head and that Smith was his red rag.

But there was method in his genial madness, and when they had plied him assiduously with cooling drinks, which he did not refuse, and soothingly assured him that there was no one there of the name of Smith:

'Then, please,' said the young man of many names and titles, 'I am Smith, and nothing but Smith, if you love me. I have longed all my life to be just plain Smith, Tom, Bob, Jack, anything you like. Oh, the joy of it!'

And Smith he was from that time on, till his larger name went home in the despatches and he followed more slowly in their wake.

And a very jolly Smith he proved, without an air about him, but with many not entirely British graces of heart and manner which endeared him to them greatly and wrought him deep into their memories—so deep that some of them never forgot him as long as they lived.

There was only one cloud on his jovial horizon, and even that a somewhat nebulous one. He had a morbid horror of cotton-wool, in the abstract, and he scented the wily chief's little plans from the first. Perhaps he was over-sensitive on the point, and inclined to regard the most ordinary precaution as cotton-woolling in disguise.

However, he held himself with a tight hand and bided his time. For when the fighting came—'Would it ever come?' he asked himself and them many times a day—the chief would be too busy to play cotton-wooller, and then he would show them the quality of Saxe-Hohenburg-Eisenach blood, even though the demonstration should entail the display of it outside its usual channels.

Meanwhile, he stood the trifling discomforts of desert life—the heat, flies, scorpions, sandstorms, unquenchable thirst, monotonous waiting, touches of sun and fever, and all the rest—with exuberant cheerfulness, and confessed them miles ahead of London—which sentiment did not meet with absolutely universal acceptance. Little Bittrell, for instance, would willingly have given the whole of Egypt, with Darfur and Kordofan and the Great Libyan Desert thrown in, for three square feet of Hyde Park, any day in the week. But then Bittrell had seen more of the Sudan than Smith had, and less of Hyde Park in its higher and more circumscribed rings.

Apart from that little matter of cotton-wool, Smith had only one other grievance of consequence at the moment. He had not so far set eyes on a dervish, or anything showing even the remotest signs of fight, except maybe a camel here and there, and scorpions of course, and a certain demon-mule which turned somersaults with him and ate the larger part of his best riding-breeches before he could get up. His one constant inquiry, with plaintive naiveté and reiteration, was as to their absolute assurance in their own minds that there was an enemy at all, or whether he was not a mere figment of their distorted imaginations. On which they told him, as Challis had just done, to wait and he would see and possibly feel.

As unobtrusively as possible, they kept him out of mischief or harm's way: saw that he did not bathe in places notoriously infested with crocodiles, that he did not get sunstroke more than was good for him, thoughtfully provided him with pen-work when he was yearning for horse and sword, let him out occasionally for a shot over manifestly safe country, and generally gave him as good a time as circumstances permitted, seeing that he could not have the one thing he wanted, which was a fight.

He begged hard, indeed, to be allowed to join every reconnaissance which left camp, but so far the privilege had not been accorded him.

At last, however, there seemed a prospect of a change. The scouting-parties reported all clear for twenty miles ahead, and they were all looking forward to the advance with eager anticipation bred of much too long and intimate acquaintance with that particular spot on which they had been grilling for weeks past.

So much for Smith. Now turn to Geoffrey Challis. Long-limbed, square-shouldered, straight as a lath, clean-made, lean of body and of face, as though every ounce of superfluous flesh had been sucked out of him by sun and sand and the wearing drouth of the desert. A pleasant, taking face, lean and brown and sun-stripped like the rest of him, facial bones rather prominent through lack of padding, which also had the effect of deepening the set of his eyes. Dark, frank eyes, inviting confidence and vouching trustworthiness. Firm mouth, under dark moustache which bristled with the heat. When he smiled, and sometimes when he did not, the crease which flickered in the lean cheek betrayed a sense of humour. At the moment he looked laxed and weary, as well he might, since, by reason of sickness elsewhere, he had—with Cameron's volunteered, and Smith's alleged, assistance—been doing three men's work for days past. He was senior lieutenant, and carried many burdens.

As to his history. Son of a fighting father, who fell at the taking of the Taku Forts. Nephew of a fighting uncle, who won his laurels in the Crimea, but fell thereafter, not from life but from grace, as recognised by the War Office. No less a warrior, in fact, than that General Carrick who proved himself as mighty with the pen as with the sword, and coming unscathed through all the terrible times of fire and snow and plague, and covered with glory for his prowess with the sword, digged for himself a pit with his pen and fell therein. For, having rent the enemy of his country whenever chance offered, he promptly turned and rent those subtler enemies nearer home, to whom he, rightly or wrongly, ascribed the agonies of suffering to which his men had been exposed through ignorance, laxity, stupidity, and worse. He was promptly, and, of course, from their point of view quite properly, shelved by the authorities, as far as so fiery-souled a man with such a grievance could be shelved. As to stopping his pen or his mouth! they might as well have tried to stop Vesuvius with a sheet of paper. But the General cared nothing for War Office, Ministers, principalities, or powers. He was very rich. His blood was very hot, in spite of the Crimea—nay, because of it; and his grievance tended to circulation and juvenescence, and at times also in the direction of apoplexy.

A truly warm-hearted old fellow, you perceive. On the death of their father, he promptly took possession of his only sister's boy and girl—babies both, and their mother also dead—and made them his own. He had never married, and never intended to. There had been a time—but she died, and he had remained true to her memory, and gave all his affection to his foster-children.

Everybody liked General Carrick, except the officials of the War Office, whom he never ceased to criticise and castigate unmercifully whenever good cause offered, and that was rarely wanting.

'It's in the building, I believe,' he would say to his cronies at the club. 'There's an insidious atmosphere exudes from the very walls, and stultifies the blood of even decent men when they get 'em. The very look of the place is enough to paralyse any man. They'll never do any good till they pull it all down, staff and all, and build it all up again from bottom to top.'

When old Jervaise quietly suggested Carrick himself as the man for the job—'No,' he said. 'I'm too hot. What you want is a cold man, a man who never loses his temper and doesn't care a straw for influences—petticoat or otherwise. A man who thinks only of his country and the future. The kind of man who would put his own brother out into the street if he didn't jump to his bidding and do it exactly so.'

Geoffrey must, of course, go into the army. Challises and Carricks always had gone into the army, even if they had not always stayed there.

He had passed out of Woolwich the year before Smith entered, and at twenty-five he was senior lieutenant, with a first-rate record behind him and promising prospects ahead. The present campaign he regarded as a special slice of luck. He had kept wonderfully well and fit, and the hard work which the staling of others had thrown upon his shoulders seemed to suit him, and was undoubtedly qualifying him for the next step up the ladder, to which he was looking forward with confidence as the reward of his labours.

His sister Ellen, two years his junior, was betrothed to Lord Charles Doone, brother of the Earl of Exmoor, and her two great anxieties at the moment were lest Exmoor, who was a very great invalid, should die and overwhelm his brother with the onerous duties of a position for which he had no cravings—at the moment he was a light-hearted sailor-man—and lest Geoff should not get through his campaign in time for the wedding.

As a soldier's daughter, sister, and niece, she wasted no time on vain fears as to his personal

safety. That was a matter to be trusted entirely to those higher powers in which Ellen Challis reposed implicit confidence.

Geoffrey himself was engaged to Una Devon, only daughter of the Right Honourable Ainslie and Lady Eugénie Devon. Lady Eugénie was daughter of the Earl of Sark. She had been one of the notable beauties of her time, and with a daughter of twenty, and possible grandchildren but a few years ahead, was still so remarkably good-looking and so wonderfully preserved that when she and Una were together it was difficult to imagine them anything but sisters a few years apart.

Ainslie Devon and George Carrick had been firm friends for thirty years, though Carrick belonged to the previous generation. The coming together of the young people had been natural enough and cause for congratulation. Una would have money, Geoffrey would have more, and everything pointed to a happy union. Lady Eugénie, indeed, in her own mind never ceased to think that her daughter, with all her advantages of beauty, wealth, and breeding, might have looked somewhat higher than Geoffrey Challis. The rest all seemed well pleased, however, so she kept her thoughts to herself, but thought them none the less—perhaps all the more.

Then Devon was suddenly nominated to the War Office, and General Carrick received the news with regret, for he could no more help criticising the War Office than he could help breathing, and he doubted it would mean an end to their friendship.

But Devon smilingly told him to hammer away whenever he got the chance. He knew perfectly well what he was putting his hand to, and had little hopes of being able to make any radical alterations or permanent improvement. But he promised to do his best and take no offence, since he knew there would be nothing personal in the General's diatribes. 'For,' as he said, 'it's not to be expected that a man who has given up his life to kicking at a thing should suddenly stop kicking for fear of stepping on a friend's toes.'

As to Una Devon, we shall meet her again. She was very beautiful, very charming in her ways, an eager participant in all the enjoyments of life, and she liked Geoffrey Challis well enough to have promised to marry him. She had been the intimate friend of Ellen Challis since they wore short frocks and matched dolls. From the very day, however, on which Geoff announced to his sister the joyful news that Una had promised to marry him, Ellen began to be aware of little defects in her friend's character which she had never perceived before. And from the point of view of this new relationship she studied her somewhat critically. For Ellen had a very high opinion of Geoff—which spoke well for him—and it is doubtful whether any girl ever born would have quite filled her ideas of the kind of wife suited to his merits. She feared Una had grown a trifle frivolous and worldly with the years, somewhat like Lady Eugénie in fact; but she would have died rather than breathe a word of it to Geoff, and, outwardly at all events, the two girls were the best of friends, as they always had been.

And so, as Geoff sat in his tent in his shirt and trousers, life looked bright and hopeful enough, and all that he particularly desired just then—beyond, of course, the universal craving for a stationary enemy waiting to be licked—was a bath, a drink as cold and long as Smith's imagination had depicted—in spite of his own pronouncement in favour of hot tea—eight hours' unbroken sleep to make up for past shortages in that respect, and another bath, and so to feel himself again.

Evan Cameron, the third man in the tent, was Challis's special chum and devoted friend. A West Highlander of good, though somewhat impoverished, family, he had been drawn to Geoffrey by a common zealous intention after the upper rungs of the ladder, which set them somewhat apart from their fellows.

Every man of them, of course, looked hopefully for promotion. That was simple human nature. But most were content to wait for it, while some few, and chief among these Challis and Cameron, bent on compelling it, set themselves assiduously to the best means thereto, worked early and late, and counted no pains lost where experience was to be gained. The frivolous ones scoffed at them and enjoyed life in their own particular ways, and these two drew the closer together and followed their own bent with imperturbable good humour and unflagging zeal.

They had known one another but a few months; but, with some common tastes and a common determination after high flights, they had become warm friends.

Cameron had one special gift denied to his friend, which he vainly endeavoured to impart to him, and buried his attempts under shouts of good-humoured laughter. He could sketch like a war-artist, and in a score of deft strokes could show at a glance what another might take an hour to describe in writing. He was indispensable on reconnaissance duty, and a terror at caricature when time and opportunity offered.

With a common object in view, their motives differed. Challis must climb because he must. The top rungs called him. Cameron, because this was his chosen path in life and all his future depended on it. The straitened family fortunes had suffered somewhat of a strain in setting his feet on the ladder. The climbing must be all his own. He was set on climbing high and far, and missed no opportunity of fitting himself for the work. He was somewhat reserved, after the fashion of his race, but true as steel, possessed of a quaint, quiet humour, and very thorough in all he did.

Now we know our men and can get on.

For several minutes Smith and Cameron worked away steadily, the latter doing most of the work and the former watching appreciatively. Beyond an occasional word between them, nothing was heard but the busy scratching of pens, and at last Cameron tossed the last sheet on to the heap and leaned back

in his chair, while Smith tipped his on to its hind-legs and heaved a sigh of relief which set the others laughing.

'It's all very well,' said he self-defensively. 'You two take to figures like crocos to mud, but I always hated 'em worse than sin. And my natural capacity, small as it is, is choked with sand and dust. My veins are getting clogged and my blood is getting sluggish.'

Then he jumped up with a sudden animation that belied his words, save in so far as figures were concerned.

'I'm off to beg leave for a scamper. It's ten days since I shot anything, and then it was only a hare, and mostly sand at that. Cammy, my dear, you know all the country hereabouts. Tell me which way to go to find something to shoot.'

'There's a mud village full of lizards about ten miles along there,' said Cameron, with a nod up the Nile.

'Next?' asked Smith hopefully. 'Try again, my dear. Lizards are vermin. Do you know, there was a scorpion wearing my trousers when I got up this morning.'

'Which of you retreated quickest?'

'I executed a strategic movement and enticed him into the open, and then made a flank attack and took him in the rear. He died on the field, and I annexed the spoils. You be thinking where I'm to go, Cammy dear, and I'll go petition the chief.'

'He's away down to Temsat.'

'*Jawohl!* I'm in luck. The Colonel will say yes if I'll promise to keep out of mischief.'

'You'll be all right as far as those second hills. I've been over the ground several times these last few days. I saw sand-grouse in the big *khor* between.'

'The big *khor* it is;' and Smith hurried off to interview the Colonel, who was Acting Quarter-master-General.

'You're looking fagged, Challis,' said Cameron. 'No sun in it, I hope?' with a touch of anxiety, as he swung his chair round and put his feet comfortably on to the table.

'Just work, my boy, and a bit thick all in a heap. Courtney's going stale piled things up a bit. But all's clear now, thanks to you—and Smith,' with the humorous flicker in the creases of his lean cheek. 'I'll be all fit after a proper night's rest;' and he tipped back his chair and put his legs over the table likewise.

'Well, see you get it. All work and no play is about as bad as the other thing in this genial clime. Off-saddle and give your brain a rest, my boy.'

The other nodded, and hauled out his pipe and began to fill it with the deliberate enjoyment of the man who had rigorously denied himself till duty was done. Cameron lit up too, and they sat smoking silently.

'When do we move?' asked Cameron presently.

'Next week, I expect. Have you got no track of the beggars out there?'

'Not a track. I begin to doubt like Smith, sometimes, whether there are any dervishes at all.'

'Bit shy and retiring, aren't they? The country's here, anyway.'

'Deuce of a country, too. I don't see what good the place is to any one except lizards and crocos.'

Then they heard the soft crunch of Smith's boots in the sand, and he ducked in through the doorway.

'What luck?' asked Cameron.

'I see no objections, your Highness—Mr Smith, I beg your pardon!—if you will promise to keep out of mischief,' said Smith, with so amusing an imitation of the Colonel's voice and manner that the others could not restrain a smile.

'He called me back,' continued the frivolous one, 'to suggest that Challis should go too. Says he's been kept too tight at it lately, and a kick-out will do him good. Dear fatherly man!' and he looked questioningly at Challis to see how he took the idea. Smith did not think it necessary to tell him that the Colonel had made Challis's going an essential part of his consent. That savoured of leading-strings and cotton-wool.

'What do you say, Challis dear?'

'When do you start?'

'An hour before daybreak, take prog, and make a long day of it. Do you good, don't you think?'

'Shouldn't wonder if it did. I'll turn in early and have a good sleep. Got order for escort?'

'Yes—six. I'll see to it all. Anything so long as it's not figures and scribbling. I'll kick you up at half-past three and have breakfast ready.'

SCHOOL-BOOKS OLD AND NEW.

By KATHARINE BURRILL.

COMPARISONS are odious! Have we not all written it inkily and laboriously in company with Evil Communications, Procrastination, and our other old friend, Punctuality is the soul of business? The Pioneer of Bumbledom and prototype of Mrs Malaprop calls comparisons 'odorous.' I believe the old-fashioned Primers, Spellers, Horn-Books, and Readers would agree both with Dogberry and with the copy-books. Would it be fair even to attempt to compare them with the really beautiful lesson-books of to-day? Poor, shabby, tattered little people! Would they not cry out to us to spare them, to have mercy on their shortcomings, and remember how hard they tried to do their best? We read Clifton Johnson's *Old-Time Schools and School-Books* (the Macmillan Company), and learn to love the quaint woodcuts,

the stern moral teaching, and the very high-flown sentiments. If we laugh at the truly remarkable Zoology and Geology, the very curious Geography, and strange History, still it is very tender laughter. The air is sweet with the scent of old-world flowers. Great-Grandpapa escorts Great-Grandmama to school, carrying her book, perhaps picking a sprig of lavender to mark her place! Alas! Great-Grandpapa does not know his spelling. He is kept in, ignominiously standing in the corner with a dunce's cap on his curly head. For the dunce's cap was a real thing long ago, not merely a paper cap in a Christmas cracker. Poor Great-Grandpapa! Through the open window he can see his hated rival, Tommy Jones, walking home with Great-Grandmama. How fervently does Great-Grandpapa hate Bolles' spelling-book! How intensely does he dislike Tommy! Never mind; once the lesson is learnt he will punch Tommy's head. This pleasing reflection is a great aid to spelling.

What queer productions were Great-Grandpapa's Picture Alphabets! We laugh at the sight of a perfectly square, striped beast alluringly described as 'The Zebra, a very handsome quadruped.' No doubt our Great-Grandparents thought him very handsome indeed. I am sure they greatly admired 'A young Lion' with very large whiskers, and 'A Bird' of minute proportions in an enormous cage. Even the most eloquent temperance lecturer could not improve on:

> **C—stands for Camel, who lives in the East,**
> **D—stands for Drunkard, a worse-looking beast.**

It seems impossible that anything could look worse than the unfortunate camel. He deserves an unqualified apology, for he is depicted with humps in every direction. He is like a camel of a later date who sorrowfully sang:

> 'But a camel's all lumpy,
> Humpy and dumpy,
> Any shape does for *me!*'

The intoxication of the 'worse-looking beast' is indicated by a fatuous smile, the presence of a large, stout bottle, and the loss of his hat, which floats mysteriously in mid-air. Of all the old woodcuts the most delightful are those in the *Little Reader's Assistant*. They are inimitable; it is difficult to say which is the greater joy, a picture of a very wily 'Christian Indian getting the better of a Heathen Indian,' or 'Putnam and the Wolf.' Clifton Johnson's book is worth buying if only to see Putnam. He is shown lying flat on his face among steep rocks, clutching the wolf by its ear. Luckily for Putnam, this particular wolf has ears like a donkey, so there is something to hold on to. Three obliging friends have lowered him to the animal's den by a rope, and the rope is pulled so extremely tight that Putnam is in imminent danger of losing his foot! It is a wonderful work of art, and a more uncomfortable way of wolf-hunting it would be hard to imagine. Was Putnam (and his wolf) the original inspirer of the skater and the wolves? How wildly he used to skate through an old *Royal Reader*, and how gallantly he now bicycles, 'hotly pursued,' across the pages of one of Chambers's excellent *Twentieth Century Readers!* My firm belief is that Putnam and the skater and the bicyclist are all the same person, and that he will turn up again crossing Siberia in a motor-car, still 'hotly pursued.' Could wolves fly, Putnam or his descendant would appear in a Santos Dumont flying-machine.

The information in the old books was varied and peculiar. It is just a little hard to find the Scots described as 'lean, raw-boned, with high cheek-bones,' with no diversions or accomplishments but 'goff and curling.' The description of 'goff' is delicious, especially the end: 'and the party which strikes the ball with fewest strokes into a hole prepared for the purpose wins the game.' Even if 'lean and raw-boned,' we had two national games. The Irish come off very badly; they have no characteristics and only two customs: howling at funerals and quarrelling! As for Poland, its animals are 'wolves, buffaloes, horses, boars, gluttons, lynxes, and deer.' This sounds rather sweeping till we discover it was written in a Primer during the Commonwealth. For the lesson-books followed politics, and changed their teaching to suit the Times in much the same way as the Vicar of Bray. Whatever happened in the outside world pointed a moral and adorned a tale in the class-room. For, like Mr Squeers's, an old-world school was the 'right shop for morals.' Even the children's play-books were full of moral lessons. Always a powder in the most seductive-looking jam, generally a great deal of powder with a very thin jammy coating. Swift retribution fell upon wrong-doers. You played with matches, and were promptly burnt to cinders. You climbed upon a chair or table, and, to judge from the pictures, the whole house collapsed about your head. The slightest vanity or deviation from the paths of strict truth and virtue met with terrible punishments. Indeed, the ways of transgressors were so extremely hard that it is a wonder to me any child was ever anything but perfectly good and well-behaved. Sometimes a child might be very bad, and with superhuman efforts become good; as, for example, 'Ellen, or the naughty girl reclaimed;' but more often the unfortunate sinners had no second chance. One step on the downward path of crime and all was over. The very good children naturally suffered from priggishness. Who can forget the conversation of those superlatively excellent young gentlemen Tom and Charles. Tom even went so far as:

> 'And I,' said Tom, 'won't play with Sam,
> Although he has a top.'

Could self-sacrifice in the pursuit of virtuous companionship go farther? Probably 'naughty little Sam' existed quite well without the patronage of 'the superior boys;' anyway, he had his top! However, even the very good had their failings; they were not proof against rewards. Think of those well-brought-up children who spent all their

money on books, and scorned the pastry-cook's shop. Did they not in the end receive the very pastry they affected to despise?

> For when we've learnt each book by heart
> Mamma will treat us with a tart.

Can you not see them studying their purchases, fruity, flaky visions floating in front of them? Can you blame them? After all, do we not comfort our grown-up selves with thoughts of 'pippins and cheese to come'? Virtue is its own reward is gratifying perhaps, but depressing when life is all virtue and no reward. We all want our little bit of sugar when we have done well; we sit up and beg, wag our tails, and hold out our paws, and—well, well, a lump of sugar is pleasanter than a kick! That virtuous woman Dame Partlet was anxious the children should learn the Hymn she had written, but did she not also provide the edible reward?

> Yet stop your grief, for she has left
> Each little girl and boy
> Who gets by heart this little hymn
> A cheese-cake and a pie.

Dame Partlet must have been Irish, and, like Captain Costigan, pronounced it 'poy.' I wonder how many children successfully ate the rewards, and how soon they totally forgot the good dame's Hymn. They had not many play-books the long-ago little people, and probably they valued very much those they had. Was not Emily Barton's joy great when her kind Papa took her to Skinner's Juvenile Library, and bought her seven books all at once? Ah, Emily! not one of the seven was half so sweet as the book you are in. Who can resist *Mrs Leicester's School*, especially in the beautiful new dress it appeared in a few years ago? Who can forget Ann Withers or Margaret Green—Margaret, who made that 'precious discovery' of the room that was 'a very large library'? Poor Margaret, she read so much about Mahomet that she thought she was a Mahometan; which quite proves that little boys and girls should not read anything but books that are for them.

Could any children have more charming reading-books than the *Twentieth Century Readers*? It is absurd to call them lesson-books. If a child cannot learn to read and love reading with these easy, clear, and simple books, then I am afraid that young person is either very naughty or a candidate for an Idiot Asylum. The illustrations are beautiful, the colouring pure and artistic, very different from the brilliant and awful daubs in the children's books of twenty and thirty years ago. The reading is all interesting and engrossing, and the print most excellent.

What I like best about all Chambers's school-books is their up-to-dateness. After all, Ladysmith and Mafeking must mean more to us than the siege of Calais or the battle of Barnet. Roberts, Buller, Baden-Powell, and Kitchener are more interesting than Early Britons or Plantagenet Kings. Yet, as a general rule, children's heads are stuffed with Henrys and Edwards, and they are told absolutely nothing of their own time. I went to school for years, and whenever I came within measurable distance of the reign of Victoria, back we went to the Plantagenets. Once we captured George IV., but only for a short time; the cry was 'Once more unto the breach,' and there we were again fighting the French when we really wanted to fight the Russians and hear about the battle of Inkermann. Of course you must learn when Julius Cæsar landed, who was Wat Tyler, and what was the battle of Bosworth Field; but these up-to-date school-books bring you quickly through the Middle Ages and land you safely in the Reign of our good King Edward VII.

At Dotheboys Hall the instruction was what would now be called 'Correlated.' You spelt 'winder' and you promptly cleaned the window. The ideal geography lesson would be to sail round the world and visit all the different countries. You can very nearly do this with the *Twentieth Century Geography Readers*. The one called *Britain Beyond the Seas* is a truly beautiful, instructive book. When you look at the map and see all the red patches you positively swell with pride. You look at the beautiful pictures and you pat yourself on the back, full of thankfulness that you are neither a 'Rooshian' nor 'a Prooshian' nor an 'Eyetalian,' but a true-born Briton with the extra luck of coming from North of the Tweed! I think this book would teach children what it means to belong to a great Nation. And a great Nation means good citizens, good workmen, good colonists. It also means good, sensible women, women who can turn their hand to anything in any clime. A Geography with pictures! Is that all? Far from it. *Britain Beyond the Seas* means more than that. Think of the Pioneers who cleared the ground, who are clearing it still; the women who bravely went with them, facing perils of land and water. It was no joke to spend five months on a sailing-ship sixty years ago; no joke to be surrounded with unknown dangers, wild beasts, and wilder savages.

> It ain't the funniest thing a man can do,
> Existing in a country when it's new.

Nature does not always help the settler; she has an unpleasant way of showing her worst side to him, of always taking the part of Indian, or African, or Maori. Nature may become the settler's best friend, but at first she is generally his enemy. We talk glibly of our colonies; but we don't think much of what it meant when we 'moved in.' We have goods and food sent to us from all parts of the globe; but we rarely think of how they first came, or what difficulties the first butter-makers, fruit-growers, and sheep-farmers had to contend with. We eat lamb from the Canterbury Plains, and forget the grim hills that had to be crossed *on foot* to reach the plains. We have Canadian wheat and Californian plums, but never think what it must have cost to let us have them. The old colonists were made of stern stuff, and I should be sorry to think there is not just as good stuff in the men and women of

to-day. We hear a great deal about degeneracy; but surely with all their numberless advantages the children of this present generation have no business to be degenerate. Perhaps we have our good things so easily and cheaply that we do not value them. Look for one moment at the old, complicated, stuffy school-books, badly bound, badly printed, and, above all, extremely dear. Chambers's Educational books are all remarkably cheap. Children, of course, will look upon them as merely lesson-books; but they are a good deal more than mere Primers and Readers. They are as good as it is possible for school-books to be. It is quite likely that the boys and girls learn no more from these books than they would from dull, tiresome, long-winded Manuals; but *that* is not the fault of the books. Juvenile ears are rather deaf to the sound of Wisdom's warning voice. It is only when we are past the age for lesson-books and have other things to do that we would like to sit down peacefully with Chambers's *New Scheme Histories*. After all, we know so little, and so few of us have Dr Johnson's splendid courage. We are not all bold enough to say, 'Ignorance, Madam—pure ignorance,' when we have made a stupid mistake. Children will never understand that lessons are not a hardship, though the modern books ought to help them to bear their hard life. Had they lived in 1846 they might have had to study Godding's *First Lessons in Geology*. There is hardship if you like! Anything more confused I never saw. For in one picture are displayed a volcano in eruption, a labyrinthodon, a dinotherium, birds, and gentlemen with top-hats. The whole is crowned with rocks, which are inscribed simply 'strata,' while the topmost peak is occupied by a small boy with a very large flag on which is written Persevere. I presume it means persevere in the study of Geology; but then why birds and labyrinthodons? They seem more Zoological. Still, the Persevere flag is not a bad one to carry whether you are learning lessons or doing your part in the world's work. Children to-day should be extremely thankful their books are made so attractive, and they should take care of them. There is no need for lesson-books to be dog-eared and dirty, torn and scribbled over. But even our well-brought-up great-grandparents ornamented their books with weird drawings and such original poetry as this found in an Adam's *Arithmetic*:

> Oh! may I learn with true submission
> Daniel Adam's composition.

An excellent sentiment, and a particularly ingenious rhyme. Another nice verse is:

> Let every *lerking* thief be taught
> This maxim always sure,
> That learning is much better bought
> Than stolen from the poor.
> Then *steel* not this book.

The writer evidently was not rich in this world's goods; he certainly was a poor speller. In old school histories the following was inscribed, truly descriptive of the books:

> If there should be another flood,
> Then to this book I'd fly;
> If all the earth should be submerged,
> This book would still be dry.

We cannot say it at all fits the new Histories, for they would not be Islands in another Deluge. They are more nearly oases in the desert, that desert that holds copies and sums, dictation and grammar. Nowadays children are luckier than their ancestors, who on half-holidays were presented with the *Half-Holiday Task-Book*, which was intended 'to enlighten the minds and improve the hearts of young children of either sex.' Poor little wretches! the short tales are monuments of moral teaching and instruction, each story ending with an appropriate verse. The old school-books were written with a good purpose; the beautiful new books are written with the same. Can I end this article with a better sentiment than this from the *Task-Book*?—

> Still we should have, in all we say or do,
> Some pleasing and some useful end in view.

THE BLACK SPIDER.

By JULIUS ASHTON.

CHAPTER I.—A FREE PARDON.

'IT'S an ugly-looking creature,' remarked the Governor as he bent over the glass case.

'*Arachnida nigra*,' said the Entomologist. 'Indigenous to Hindostan and Australia. Seldom attacks you unless terrified or menaced, but very unpleasant results may occur if it gets a fair bite at you.'

'Death?' inquired the Governor.

'Often. Not always; that rather depends on the condition or resisting capability of the individual bitten by it. A strong, healthy man would get off with very painful swellings, inflammation and fever more or less acute. Young children and people whose blood is in an unhealthy state would be in danger of a fatal termination. When I was in Poona I knew a fellow named Morton, whose only fault was that he loved "special Scotch" not wisely but too well; and unfortunately he had more money than good sense. One of these spiders got on the back of his neck somehow or other. Very likely it would have crawled away without hurting him if it had not been disturbed and frightened. He felt it moving, and, naturally enough, put up

his hand to knock it off. Result, a bad bite; and in the case of a man like poor Morton, whose blood was completely alcoholised by excess, you don't need telling how it ended. I'm pretty fit myself at this moment, and live a very abstemious life for the sake of my work, but I shouldn't like to have that creature'—he pointed to it as he spoke—'alive and fixing its fangs in my neck.'

'That's a curious dull red spot on its back.'

'The differentiating mark,' said the Entomologist. 'There are other black spiders, of course, but that mark indicates the poisonous species.'

'Well, I'm glad we don't have them in England, anyhow,' said the Governor as he bade his friend good-bye. 'Many thanks for showing me your most interesting collection; but if I were allowed to select any specimen I liked as a memento, I should certainly not choose the Black Spider.'

Governor Irwin drove back to Portbury Prison, the great penal establishment over which he presided. Arriving there, he proceeded to his private office, where his secretary was busily engaged in checking some sheaves of statistical papers, and sitting down at the table, he drew towards him a small pile of letters which had been delivered by the midday post. One of these was a large official envelope from the Home Office, and as he read it a frown gathered on his face, and he said in a tone of disgust, 'Another of these stupid blunders.'

The secretary looked up inquiringly, but did not venture a remark. Governor Irwin was a man with whom it was prudent to be careful.

'Another free pardon, Simpson. Look up Frederick Lane's number. What is it? Forty-seven? Well, touch that bell.'

A warder appeared at the door, and saluted.

'Bring No. Forty-seven here,' said the Governor.

'Yes, sir. He's in the West Quarry gang, but we'll send for him immediately.'

The armed guard in charge of the West Quarry gang were rather surprised when a warder came up to take one of the convicts back to the prison, but not so much as No. Forty-seven himself was. No words were exchanged between the custodian and his charge, and presently the latter was brought into the Governor's room.

Not all the degradation, the brutalising influence, of the convict's dress, cropped hair, and bristly, unshaven face could hide the real character of the young man who stood before the Governor. Tall, erect, with something of fearlessness and independence in his bearing, he saluted his superior and waited for the first words of that official. They were as concise as they were welcome.

'Like almost every man who comes in here, you have asserted your innocence of the crime for which you were sentenced. I am glad to find that that assertion was a true one in your case. This'—he held up a paper—'is a free pardon from Her Majesty the Queen. The man who committed the forgery for which you were tried died in hospital three days ago, but not until he had made a full confession before a magistrate who attended his deathbed, and who witnessed his signature to the written deposition. I regret that you should have had to undergo eleven months' imprisonment; but, of course, that is no way our fault. You are at liberty, Mr Lane'—how sweet the ordinary courtesy sounded to the man who had so long only heard himself addressed by the deadening formula of a number!—'you are at liberty to leave the prison as soon as you like.'

'I thank you for your expression of sympathy, sir,' replied the young man; 'and the fact that my innocence has been established is, of course, only what I have hoped and prayed for ever since I came in here. I have had nothing to complain of during the time I have been Her Majesty's guest in Portbury.' A bitter smile crossed the handsome mouth as he said the last words. 'A "free pardon" seems a curious thing to give a man who has never stood in need of it. But I suppose it is the customary formula.'

'Yes; neither of your making nor mine, and we need not discuss the suitability of the term to your case. Your own clothes will be ready for you, and you can leave at once. You had some money with you when you came in, I think?'

'Yes; a few pounds in my purse.'

'Good. Well, you have my sincere good wishes for your future. There is no disgrace in having been in prison, so long as you were only the victim of a rascally plot and not a real criminal. But, of course, it is hard lines all the same, and once more I offer you my sympathy and regret. By George! now I come to think of it, the same thing might have happened to me for all I can tell. Fancy the Governor of Portbury a prisoner in his own "strong-box." Ha, ha! Good joke that!'

As Mr Irwin laughed at his own humorous idea he extended his hand in kindly cordiality to the man who stood before him in the unjustly worn dress of a condemned felon; then he nodded a friendly 'good-bye,' and the interview was ended.

Half-an-hour later Frederick Lane walked out of the great prison—a free man. How sweet it was to feel that he was at liberty again—that he could go where he chose, do what he pleased, and no one to forbid the unfettered exercise of his will or wish! He went straight to the railway station, ate some food at the bar of the refreshment-room, and then took the train for London. Arriving at Waterloo, his first business was to search for a quiet, inexpensive lodging; and then he resolved to give himself an evening's amusement as a vivid contrast to the dreadful monotony and constraint of the past eleven months in Portbury. After a frugal tea, he lit the new pipe which he had bought, and opened the *Daily Telegraph*. But the realisation of his new conditions came across him again, and with such pleasing force that he held the paper idly in his hands for a few minutes. Tea! He had not tasted that for eleven long months. How delicious it was, so refreshing and invigorating! Butter—unlimited butter, too—an equal stranger to his palate. And tobacco, blessed soother with its fragrant aroma,

how he revelled in its curling cloud! The news of the day! He had been entirely cut off from all knowledge of what was passing in the world for nearly a year. States might have fallen, sovereigns died, for anything he had heard while in Portbury. Really it was some little set-off against the deprivation of these luxuries to be able to value them so highly now.

Presently he turned to the advertisement columns, and scanned the announcements of entertainments for that evening. There were so many tempting attractions that he hardly knew on which to bestow his patronage. Ultimately he decided on a music-hall; Cinquevalli, the great conjurer, was on turn there, and Lane remembered that before the hateful gates of Portbury closed upon him the famous juggler was just beginning to rise into fame.

A man who has been without a scrap of public news for eleven months, who is utterly ignorant of all that has happened during that time in this busy, palpitating world of ours, does not read his first paper with the same half-careless indifference as the City man who opens it every morning in the train which carries him to his work. Frederick Lane perused almost every line in the ten large pages of the *Daily Telegraph*; even the advertisements interested and amused him. And it was solely through this minute examination of its contents that he did not overlook one small, inconspicuous paragraph on the page containing the usual City article—a paragraph of more personal and vital interest to him than all the rest of the newspaper. As he read it his hold upon the printed sheet involuntarily tightened, until the edges of the paper were a crumpled mass, and his eyes dilated slightly as they took in the words: 'The failure was announced yesterday of Rockton, Lane, & Co., merchants, of Basingstoke Street, E.C. The firm transacted a very large business in imports from India and China, including tea, silk, indigo, and articles of native manufacture. The liabilities are estimated at about a quarter of a million, and it is thought that the whole available assets will hardly amount to half that sum. Over-speculation, it is rumoured, is assigned as the cause of the collapse.'

Frederick Lane put the paper down, and sat moodily gazing at the wall for some minutes. Then he rose, shook himself impatiently, refilled and lit his pipe, and paced the room, thinking deeply on the disagreeable surprise he had just received.

'Was ever such bad luck?' he murmured half-aloud. 'Failure of Rockton & Lane on the very day I come out of that hell upon earth for an innocent man, Portbury Convict Prison! And I was going to-morrow—to-morrow morning, in fact—to see my uncle, John Lane, and ask him to take me into the firm as clerk, traveller, anything in which I could make a fresh start and work my way up. And he would have done it. He was furious when I was tried, condemned, and imprisoned. No wonder; I can't blame him. But my proved innocence and the cruel injustice I suffered have put things in a very different light. He would have helped me to begin again. Bankrupt, penniless, he can do nothing for me. And I know how hard it is to get some place of employment worth a couple of pounds a week if you are friendless and alone in the world, as I am now. The future looks black enough. Am I going to come down to road-mending, match-selling, or dock labour?'

He paused. His faced brightened; a new hope seemed to have suddenly arisen in his mind. 'Australia!' he said eagerly. 'A new land; a clear start; the miserable, unfortunate past left behind; a fair field and no favour. That's all I ask, and it will be strange if energy and determination cannot do for me what they have done for many others. There must be work—there must be many chances out there. I have enough left to pay my steerage passage, and to keep me for a few weeks till I get some engagement. The clouds lift. I see light in the far distance. I'll go to Australia—the new England beyond the seas, the land of gold, of the Bush savage, the emu, the kangaroo, and the home of many strange things.'

And Frederick Lane might have added, if he had known of its existence—which he did not at that time—'the home of *Arachnida nigra*, the Black Spider.'

A LADY-TRAMP IN CANADA.

By Margaret Innes Pollock.

First Paper.

'YOU are a regular vagrant,' was the greeting I received from a friend the other day; and she had good grounds for her remark. Owing to various reasons, I had been wandering about the world for years, and had just completed a leisurely stroll round it. Wealthy people travel with an easy mind, knowing that when the money they take with them comes to an end they can obtain more by post or telegram. Others, although the gipsy instinct is strong within them, are afraid to fare forth in case of getting into difficulties. The latter may be interested in the following simple account of how a lady-tramp saw a great deal for a small sum. Tramps are not always idle; and it was the results of an unexpected piece of work which replenished my lean wallet and made it possible to indulge in the last of those pilgrimages which, on previous occasions, had proved such a source of pleasure, as well as of use in many ways.

Where should I bend my steps? I had already been on the Continent, in the United States, Africa, and the Holy Land. While I was debating the question I met a lady with whom I had a conversation which decided the matter. Mrs S. had crossed the Atlantic to collect fifty young women to take back with her to Canada as servants; and she told me that, if I accompanied her party, she could obtain a second-class ticket for me at the emigrant rate—namely, seven pounds ten shillings from Glasgow to Winnipeg. Within a fortnight I found myself in the train which was to convey us to Liverpool. It was an amusing and pathetic scene at the station, where fifteen girls had friends to see them off, and I felt thankful that the inexorable signal to start punctually cut the partings short. Next forenoon all, including the English and Irish contingents, were collected on board the steamer. The accommodation was satisfactory, but the food was rather coarse. Fortunately we had an exceptionally calm passage, so the girls suffered little from sea-sickness, and the rough fare disappeared in a marvellous manner. Some were quiet, modest girls, others flippant; but all loved Mrs S., who was kind, motherly, and yet firm in her supervision. Of course some flirting went on, but I did not see any signs of broken hearts—although I do not know how many may have been chipped on the way—when it came to saying 'Good-bye' to all on board.

We were not detained by fogs, so in due time found ourselves sailing up the St Lawrence, with the French-Canadian houses on the banks looking as if they had been taken out of a box of toys, and behind them the hills partially covered with snow, which made the dark clumps of trees stand out all the more clearly. Those who were on the outlook got a beautiful view of the Montmorency Falls shortly before reaching Quebec. A special train was awaiting us, so there was no time to inspect that interesting, picturesque city. The baggage of every description was quickly passed through the Custom-House, checked, and put on board the train. Then all bundled in, and we started on the journey, which lasted three days. Our carriages were what are called tourist-cars. The seats can be pulled together in such a way that they serve as couches at night, and there is also an upper row of berths which can be let down by chains. A small kitchen formed part of the long car, and proved a great convenience. The brakesman lighted a fire when it was required, and here the kettle was boiled. Dishes and provisions had been put aboard at Quebec. Necessarily the food was rather monotonous, but it was unlimited, and everything of the best. As it was a special train, with only a few passengers besides our party, there was no dining-car, but the little folding-tables between the seats enabled us to have our meals in comfort.

The bleak, wintry hills were soon left behind, and the trees seemed to be donning their spring garments everywhere as we rushed through the 'forest primeval' or by the sides of lovely lakes. What tracts of land were apparently uninhabited!—miles of woods with young saplings growing round the gaunt, bare trunks of giants which had died as they stood and had been left to rot because there were no hands to cut down the timber while it was valuable. Sometimes there was a short stoppage, and we were glad of a walk up and down the platforms or in a clearing, as the case might be. On one occasion we paused in the middle of a dense wood, close to a shanty inhabited by men employed on the line. It was evidently quite an event for the young fellows. They had just made a kettleful of tea, which was soon poured into cups and handed to the girls as far as it would go, their store of biscuits being also divided among their unexpected guests. A lot of merry talking and laughter went on; but in the midst of it all I was struck with the silence and solitude of the forest. At another stoppage, where only one house was visible, high wages were offered to any girl who would descend there and then to help the family in some domestic difficulty; but no one was found courageous enough to face it.

At last the railway journey was over, and the train steamed slowly into Winnipeg. It was a joyous group that marched to the Home of Welcome, a safe, comfortable place, where the girls were received on landing, for twenty-four hours free, and after that only paid a small sum till they obtained situations, which they all did within a week. To inexperienced minds, before leaving home everything had appeared *couleur de rose* across the seas, and I suspect some of the girls expected to have an easy life. They were soon undeceived. In Canada fewer domestics are kept than in the same class of houses in England. Work is hard, but wages are good. I stayed in the Home for a week at a cost of twelve shillings and sixpence, by which time the exhilarating air and bright sunshine made me feel disinclined to retrace my steps directly.

To see the Rockies had been a cherished desire, and this seemed a feasible project; but I had a still higher ambition. A dream of going to India, which I had often indulged in, but never expected to be realised, returned with persistence; but to go straight on at the moment was out of the question, as that would mean arriving at the hot season under a tropical sun. Meanwhile, it was wiser to try and gain money instead of spending what I had brought with me. Domestic work was the only thing I could profess to do well; so, as there is nothing degrading in using your hands in this way—your head is required also, for a pudding as well as an artist's colours ought to be mixed 'with brains'—I went to help a lady to run a boarding-house for young men. From fifteen to twenty were in the establishment, and as they paid well, they expected good meals in return. Here I was initiated into the mysteries of Canadian cookery. I became quite an adept in making 'pie,' which

might be called the national dish, and laughed over my preconceived ideas of this dainty. I had imagined pumpkin-pie to be a gourd filled with all sorts of ingredients. Alas for my fairy chariot! It turned out to be nothing more nor less than an open tart filled with stewed pumpkin, mixed with eggs and spices. The speed with which a Canadian lady would get a meal ready surprised me. The washing-up process is more tiresome, owing to the fashion of having a number of small dishes, like satellites, round each person's larger plate: at dinner, one for potatoes, a second for vegetables, and a third for pickles; while at supper, butter was placed on a tiny saucer, preserves on another, and so on. I only remained a fortnight in this house, and then went to an easier situation. After being there as long as temporary assistance was required, I heard of an invalid who was glad of help. She and her family were very pleasant, and lived in one of the suburbs, in a frame-house planted down in a side street off a main road, with only a paling separating the back-green from a thick wood, part of which had been cut down to make room for the house. A foot-path made of planks several inches above the ground ran along the edge of the road, which you had just to cross to find yourself in the wood on the opposite side. Tallies were visible at regular intervals, intimating that each lot was 'for sale.' The road in front of where I dwelt was baked hard, but the deep ruts made me wonder what it would be like in wet weather. I thought stilts would be required to cross it, and yet the electric car was passing within a few hundred yards.

Winnipeg altogether seemed strange to English eyes, with its wide streets and handsome blocks in the centre, its long avenues lined with trees, behind which stood villas surrounded by well-kept lawns and flower-beds, its waste spaces, and its houses of every description dotted about and straggling outwards till you could not say what was town and what was country. You could step right off a wooden pavement on to the prairie! I saw no beggars and heard very little of actual poverty. Every one wore a bright, hopeful expression, and walked with a brisk air that was inspiriting. Only a small proportion are amassing fortunes, but many are comfortably off, and all know they are sure of a living if they are willing to turn their hands to whatever comes in their way and work hard. The old absurd ideas which prevail over here as to what employments are in keeping with one's dignity must be laid aside in Canada. Food is plentiful and cheaper than at home, so housekeeping is easier where means are limited.

If I had been remaining permanently in Winnipeg I could have got three or four dollars per week, but I contented myself with less, preferring temporary engagements, which gave me a varied insight into the family life. I had not a little amusement out of my dual personality. It was very entertaining to be under orders, 'playing the servant,' as a friend described it, during part of the day, and then be asked to address a drawing-room meeting, or spend the evening with a professor's family, or visit some of the charming, highly cultivated people whose acquaintance I made. It was even arranged that I should give an address at an Institute; and on this occasion, when the advertisement was handed in to a newspaper office, one of the staff requested 'an interview,' which I declined. All this agreed with the social equality which I had been under the impression obtained in Canada; but my experiences were of a mixed kind. In only one house was I allowed to sit at meals with the family, and I was never invited to join the circle in the veranda in the evening. Personally, I very much preferred this arrangement. One day I entered by the front door when a soldier's funeral was passing. A boarder was idly rocking herself in the veranda; and, forgetting my incognito at the moment, I remarked that I had heard a few bars of the music at the service in the Roman Catholic chapel, but that it seemed nothing in comparison with a Requiem Mass I had heard sung by the Vatican choir in Rome on the death of a cardinal. Her look of astonishment nearly upset my gravity; and yet the same lady when I was leaving advised me, if I intended following the line I had chosen, 'to keep myself entirely aloof from the household.' She was considerably surprised when I informed her that I was doing this merely as a means of gaining money to spend upon travelling.

In church, however, I did not discover any distinction of persons, an office-bearer often welcoming me and inviting me back. The Sunday after I arrived I 'made tracks' for the Rev. Charles Gordon's church. I had been reading *The Sky Pilot*, and unconsciously had drawn a mental picture of the author, strong, broad-shouldered, with rugged lines about the face and a mass of unmanageable hair. How different the original proved, with his slight figure, pale, studious face, and the quietest of manners! His sermon was interesting, and he follows the kindly fashion of sometimes leaving his pulpit at the end of the service and coming to the porch to inquire after sick members and exchange greetings with others. Seeing I was a stranger, he shook hands as I passed out, and I went home with more admiration than ever of 'Ralph Connor.'

Two months was long enough for Winnipeg, so I proceeded to Vancouver, being fortunate in obtaining a ticket, which only cost me twenty-five dollars instead of forty, for a parlour-car. These cars have reversible spring-seats, which are very comfortable during the day, but too short to admit of your lying down at night. The train was not crowded, and I had a corner to myself, so I began to investigate, and found I could lift one cushion and place it, supported on a small box, at right angles to another, and so make a comfortable couch. Next morning a gentleman told me he had been greatly amused with my contrivance. I hoped I was ensconced in my corner for the whole journey, but so many pas-

sengers left the train in the evening that my car was dropped. A young lady and myself took possession of two seats in a tourist-car, and passed the night in a satisfactory manner; but the Fates were against us, as again our particular car was dropped. This time we betook ourselves to a colonists' car, where two fine young fellows belonging to Strathcona's Horse, on their way home from Africa, told us they were leaving the train at midnight, and insisted on our accepting the mattresses and pillows which they had bought for a small sum at Quebec, and which so transformed the hard seats that we had a good rest.

Three meals a day were served in the dining-saloon at three shillings each; but as this was too expensive for a tramp, I took provisions with me, and found this was a common plan. Boiling water was generally available at the kitchen; but in crossing the Rockies the dining-saloon was dropped, as the hotels belong to the company. This rather dismayed me; but just as I was making up my mind to do without tea I saw a gentleman enter with a teapot in his hand, and with his wife and girls enjoy a repast. When they had finished I asked him where he had got tea infused. 'Wait till the next stopping-place and I will show you,' was his reply. Shortly afterwards he led me to the biggest tea-kettle I ever saw—namely, the engine! The driver courteously let some water run through a thin pipe and then filled my cup, so I had the refreshing beverage after all. If hunger had not periodically asserted the claims of the 'inner man,' I should have forgotten about food altogether in ecstasy over the scenery. The endless, boundless stretches of level land gave one expansive but rather monotonous sensations; but when the prairie was left behind, one's whole attention was riveted with the queer, fantastic forms, resembling towers, pinnacles, ramparts, and castles, unlike anything seen elsewhere, which fancy suggested might be the work and abode of hobgoblins, while here and there were patches of grass, flowers, and foliage which might be the homes of fairies. Next came the splendid mountains, with snow-clad summits, the glaciers, the pine-forests, the deep gorges through which the river was rushing, and the wonderful railway line with its trestle-bridges over profound chasms, all of which are utterly indescribable. How thankful one felt for the observation-car, open on all sides, without even glass windows; although at the same time you wished the train would stop every few minutes, in order that one lovely view might be fixed on the film of the mind's eye ere another obliterated it!

The surroundings of Vancouver reminded me of Scotland—only that the hills were finer, and our largest trees would seem dwarfs beside those in Stanley Park. The town is rapidly increasing year by year. Situations were as easily obtained as in Winnipeg, and the remuneration was higher, so I took an engagement for a few weeks till I saw whether or not I should go on to India, *vid* Japan and China.

THE LAGOS BAR.

NO one who has had the pleasure of crossing the bar at Lagos ever forgets the experience. The passenger who is bound for Lagos is apt to congratulate himself on his own prospects when he sees his fellow-passengers leave the ship at Sekondi, or especially at Accra, for the risky and unpleasant trip through the surf that is their lot; but when he arrives in Lagos Roads, and sees the little steamer which is to carry him into the lagoon, and watches the dancing surf-boat from the smaller ship coming across to the newly arrived mail-boat, he wonders whether, after all, he has so much to boast of as he imagined. Lagos, important town as it is—inhabitants like to call it the Liverpool of West Africa—does not boast a good harbour for ocean-going steamers of deep draught, but lies on a great lagoon which is separated from the Bight of Benin by a dangerous bar, over which only boats of light draught can pass.

The bar has a bad reputation, and many of the stories, more or less apocryphal, that the new-comer hears from 'old coasters' begin, 'The first time I crossed the bar,' and then follows some hair-raising tale that makes the new arrival wonder how he could have been such a proverbial idiot as to risk his person, on which he at least sets a high value, on such a frightful adventure. Supposing the boat reaches the roads at night, and the branch-boat is already waiting, it is not reassuring to watch the arrival on board of the captain of the smaller boat, and, perhaps, the one or two persons who have come off to meet their friends. There is plenty of light on both boats, but the space between is a great black gulf, in which the lantern carried in the surf-boat looks no larger than one of the stars above, and has no greater power of illumination. Over the water come the remarks of those who are leaving the branch-boat; and the monotonous chant of the Kruboys who are using the paddles comes nearer and nearer, till at length the surf-boat arrives alongside, and the 'boys' have got hold of the hawser that runs round the ship's hull. Then there is a brief interval of excitement, varied with language of a more or less sulphurous character as the passengers scramble up the rope-ladder that hangs over the ship's side. It is the last thought of the new-comer before he drops off to sleep that night, and it is his first thought in the morning too, 'How on earth shall I get into that wretched boat?' Morning comes, and there is a scramble for breakfast, for the boat is late, and the captain is anxious to weigh anchor again and be off to

Forcados, where he will discharge his cargo; and so all is hurry and confusion.

At length the actual time for getting off comes, and you go down to the main-deck and look on with a sickly sense of dread while others take their departure. You are fortunate in having the choice as to how you will reach the surf-boat, which is dancing on the water far below the steamer's deck. Either you may go over the side by means of the ladder, which means a few delirious moments when you have reached the bottom rung and are feeling about with your feet for the sides of the boat, every moment fearing you will be caught between the sides of the steamer and the surf-boat, till at last you are clutched by some one below and reach your destination in safety and trembling; or else you may elect to travel over the side in the 'mammy-chair,' a huge barrel with part of its side cut away slung in the air by the steam-winch. You take your seat and are thinking it isn't so bad after all, when, to your ineffable disgust, some one else gets into the tub with you and affectionately puts his elbow into your eye, or perhaps crushes in the side of your new pith helmet with some part of his anatomy. You are just going to decide that you will get out and go by means of the ladder after all, when there is a shout, and you are suddenly yanked up into the air by the winch, swinging for a moment or two (though it seems a lifetime), and then you go down, down with a swift plunge, wondering if the boat is under you or whether you are going to have an impromptu bath; and then there comes a sudden jerk, and you think it is all right now, but in another moment you go down again, and land with a bang in the middle of the surf-boat, where you make your escape as quickly as you can, for you are not at all sure that the tub may not go up again before you have time to get safely out. Then you count your bones to see if all of you is there (you feel as if you had left your breakfast behind), and register a pious vow that next time you will go by the ladder. Next time you do so, and when just on the rungs of the ladder, decide to go by the tub after all, which plan is frustrated by the arrival of some other passenger above you forcing you to get down as quickly as you can for fear you should find his feet planted affectionately on your head. A climb on a ship's ladder is like married life: when you have once begun it you must go through with it!

Then comes the trip across the water to the branch-boat. It is not easy to say which is the most unpleasant part of the trip, the beginning, the middle, or the end. Each has its own delights, and you must try them all before you can give an opinion. The surf-boat seems a small thing after the great steam-hotel you have left, and she rolls in such a fashion that you wonder how you could have thought that there was a *calm* sea! The boat dips to the waves as they come broadside on, and occasionally you ship a little sea and think longingly of the Liverpool landing-stage. Also, you remember all the tales you have heard of the sharks that abound in these waters, and you wonder if there are any about just now on the chance of getting a free lunch.

Then, to add to your enjoyment, one of the Kruboys pours a quart or so of water from his paddle over your unmentionables, while another voyager who is seeking a less uncomfortable position (it would not be correct to say a more comfortable position: there is no comfort on a surf-boat) puts his foot squarely on your favourite corn. You feel that no human tongue can do justice to the situation, and so bear it uncomplainingly, and think enviously of Job among the ashes. He at least had a resting-place on *terra firma*. But even a voyage in a surf-boat comes to an end, and at last you reach the little branch-boat, where all the business of scrambling up the side is repeated, with the one exception that there is not so far to climb; and when you reach the deck you have already an affection for the boat, small as she is and dirty though she may be, for she does not wallow in the swell like the surf-boat, and there *is* room to stand, and something to hold on to.

At length all the passengers and mails are aboard, and the captain rings 'Stand by' to the engine-room, while the mate goes forward to get the anchor up. By-and-by all is ready, and dipping her ensign to the boat that has been your home for the last fortnight or so, the branch-boat starts her voyage to the town. Already you can see the line of white water that marks the bar, and the huge rollers that are always racing towards the shore. Nearer and nearer they come till you can see away to your right the remains of the wreck of a boat whose bare mast stands out of the roaring surf, a mute witness to the dangers of the pilotage here. The captain is pacing the deck, tossing orders over his shoulder to the steersman, and now and then stopping to look through his binoculars for the various indications of the course of the channel. Then the boat is fairly on the bar, and gives evidence of the fact by behaving as if she were a surf-boat herself, rolling and pitching and swaying among the great combing rollers. The flag on the signal-station indicates that it is a 'good bar,' and you wonder what a bad one is. If you are lucky you get over with a dry skin, but very probably a great wave may come over the stern, wetting everything generously, and making you wish you had gone on the bridge, where there is less likelihood of your being drenched. Then suddenly, at the end of one of her downward plunges, there come a bump and a jar as the boat, light of draught as she is, touches the bottom, and stays for a moment shuddering like some live thing. But the danger is soon past, and then gradually the waves seem to become less and less formidable, and you get into fairly smooth water, and look back to see what you have come through, promising yourself that you will never come across again till you are 'going home.' However, such a promise is likely to be

forgotten, for after a term ashore you are glad of the chance of a sea-breeze that a trip on the branch-boat offers, and you will be found going over the bar 'just for the trip, you know.'

After this it is all plane sailing. The vessel ceases to roll and toss, and from the bridge there comes a sound of the popping of corks that tells that the captain and the mate consider the hard work of the passage is over, and that now they can take things a little easier.

Up the lagoon we go, passing the signal-station on our right, at length reaching the town, past Government House, the quarters of the 'Waffs,' as the West African Field Force are dubbed, the Secretariat, Christ Church, and all the houses and stores that line the Marina, till at length the boat slows up and warps in to the Agency Wharf, where we get ashore and thank our particular lucky stars that we are safely across the Lagos Bar.

Perhaps some day a permanent channel will be made so as to allow of the admission of larger steamers into the lagoon. At present the channel is frequently shifting, making it a constant menace to the safety of the vessels that come in; but the estimated cost of constructing a permanent channel is eight hundred thousand pounds, an expense the Colonial Government certainly cannot afford. Such a channel would be an enormous boon to the colony and also to the shipping firms who trade to the coast.

At present Messrs Elder Dempster and the Woermann Line have to maintain a considerable fleet of small vessels not only for the transference of passengers and mails on the arrival of the steamers, but also for the purpose of carrying cargo down the coast to Forcados River. Moreover, the cost of freights would be considerably lowered, and the time occupied in getting cargo out from England considerably curtailed. Perhaps the Imperial Government will come to the help of this really important colony, and do away with all the dangers and delights of the Lagos Bar.

A NEW-YEAR MEDITATION.

Hark! I hear the midnight chime
From an ancient belfry pealing,
Tolling out the flight of Time
While another year revealing;
Now like funeral dirges knelling
To the pilgrim nearing home,
Now with joyous anthems swelling
For the days that may not come!

But to me—my vigil keeping
In the silence of the Past,
Ever ready for the reaping—
Comes the harvest gathering fast,
From the seeds a wanton scattered
Trifling through life's chequered path,
Thoughtless sown when Folly flattered,
Yielding still their aftermath.

Ere my tortured soul recovers
From her frenzy of despair,
Changing weird the vision hovers,
Weaving fancies in the air;
Vagrants through the realms of thought,
Visits from the starry seas,
Bringing, with the magic wrought,
Retrospective fantasies.

In the vista of the ages
Spectral phantoms from the dead
Quicken into Memory's pages,
Rising from their silent bed.
Doffed the golden crown awhile,
The golden harp awhile is hushed,
Hallowed love illumes the smile
Lit to cheer a pilgrim crushed.

Silvered locks and sunny tresses,
Liquid depths from baby eyes,
Friends so staunch their friendship blesses
Even from beyond the skies.
Wide they lift the mystic curtain
Of the Future from the Past,
Making plain the dim, uncertain
Visions of the Unknown vast.

Earnest of the promise given,
Harbingers of peace untold,
Pointing to their home in heaven,
Crowns of sorrow changed for gold.
Vividly they tell the story
Handed down by faith divine
Of sinful souls redeemed to glory,
Destined with the stars to shine.

Soft and sweet their voices stealing,
With the cadence of each chime
Whisper to my soul, revealing
Of the hope that is sublime—
Of the hope whose blossoms thrive
O'er the grave of vain regret,
Bidding drooping hearts revive,
Making trembling souls forget.

Keen may be the old-time sorrow,
Lonely though the life to-day,
Hope reveals a bright to-morrow
If we only watch and pray.
Then with the pæans gladsome ringing,
Ringing in the New-Year's birth,
Lifts my soul to joyous singing
For God's promise to this earth.

A FORGOTTEN SAINT.

By Edwin Lester Arnold.

This ancient cross of St Piran—about 9 ft. high—stands in a rarely visited spot amongst the sand-dunes to the north of Perran-porth in Cornwall.

MANY strange stories are told of the vicissitudes of saints, but none of them stranger than that of the historic hermit who was once to the west what St George is still in the east of England. His see is fringed by a fascinating coast where the fresh, blue waters of the Atlantic break upon wonderfully rich and varied beaches; yet though busy railways and turnpikes bound it on the other sides, civilisation forbears to trespass on the glebe of the good St Piran. Indifferent to tithe and toll, beyond the reach of Ecclesiastical Commissioners, this famous missionary takes but a passive interest in the lands he once loved so paternally. Were it otherwise, there would be grief in his kindly spirit and unrest in an incorporeal essence which, if tradition and guide-books speak truly, well deserves uninterrupted repose.

The chapel of this patron of all west-country miners is the centre of a wilderness of desolation. The yellow Cornish sand has swept up from the Irish Sea in a succession of irresistible inroads, burying and obliterating until to stand at his ruined shrine and glance round on the undulating wilderness is like beholding Sodom and Gomorrah when their desolation was at its full. In its very barrenness there is an attraction in this region which is lacking generally in the haunts of the holiday-maker who clings tightly to the limits of the well-travelled—knows of nothing which Cook does not recognise as orthodox, and ventures nowhere but along the beaten track. Here, to the north of the little Cornish village of Perran-porth, is a district that will not tempt one sightseer in a thousand to break its repose; yet, almost unique of its kind, there is a striking episode wrapped in its sandy dunes, and a moral after the story for those who press the matter so far. Hedging it on three sides are undulating uplands all pleasant enough in the rich livery of summer, the crofters' emerald meadows between their stone walls, crowned with heather and golden gorse, mapping out the ridges, while gray stone cottages, substantial and comfortable if a trifle uncouth in design and material, nestle amongst vigorous fuchsia hedges and prolific garden patches. Life and cheerfulness is, in fact, aggressive on this hand, and on the other is the broad blue zone of the sea, lying fair enough under sunny skies, and not a particle of ill-will, it might be thought, in a thousand leagues of it.

Yet this salt-water has been the ruin of St Piran's glebe lands, and has made the district where probably he first landed a byword of the countryside, a wilderness pointed out to the tourist from the vantage-point of his coach-top, as he winds over the remote inland ranges, as a place to be avoided, a field of mystery and death.

When the famous Cornish apostle, whose name is better known than his living, came over from Ireland he came with a mission, and came in a manner that can hardly have failed to impress the hardy but superstitious fisherfolk upon whom he descended. Perhaps his ideas of ritual clashed with those of Irish parishioners, and a judgment of the Court of Arches of the day suggested the expedience of a speedy retirement, for procedure was somewhat summary at the time. Or possibly the saint, being wise in the ways of the world—as many successful saints have been—knew that half the actor's art is in his entry.

Be this as it may, these Ancient Britons whose huts faced the Irish waters beheld on a day (the exact date of which has slipped the memory of history) the evangeliser coming to them on a millstone, rising to the waves, and no doubt paddling down the furrows of the sea with his crosier, as

[*All Rights Reserved.*]

indifferent to wind or weather and as absorbed in the contemplation of his task as its merits deserved. The good Scotch prelate who circumnavigated Scotland in his stone coffin until he found a resting-place to his liking could not have astonished the natives more than his prototype in the south; and we may take it for granted St Piran landed to find himself famous at once. He may have settled in as rich and fertile a region as any within the four seas. Even to-day, when our apostolic visitors are less adventurous, and the Gulf Stream, pessimist philosophers suggest, is growing gradually cooler and sweeping our shores more languidly, Cornwall is abundantly stored with all good things of nature. The timber that luxuriates now in quiet glens, and those orchards clothing the hillsides, may then have come down almost to the water's edge; the bright green of the ferns, and that wonderful yellow haze that clothes the ground where the gorse is in blossom, may have overhung the beaches and framed in the clusters of pagan huts whose occupants were the first to turn out and welcome the newly arrived saint. That he found the district given over to moral unrighteousness, though physically a land of milk and honey, there can be little doubt, and bitter must have been the hostility of Druid priesthoods to this interloper into their last stronghold.

Tradition is, indeed, a little uncertain as to how far the good man unbent to the rude simplicity of manners which reigned on our side of St George's Channel. A sacrilegious and libellous comparison, for instance, even to-day dubs a reveller found benighted in a peat-hole 'a Perraner.' Then, again, we recall how three headless skeletons with their skulls between their knees were found under this ancient vicar's altar-stone; it inevitably sets an inquiring mind wondering what were the men and manners of the time, and whether parochial affairs sometimes caused little unpleasantnesses between a rector and his overseers of the poor, as it is said they do nowadays! But Cornishmen love their first bishop, swearing by him, as well as attributing to his invention the science of mining and even the very discovery of tin itself in the duchy; and though research is very dubious on this latter suggestion, there is no reason to show why we may not safely ascribe much good to their ancient missionary. Monoliths and crosses standing by the ancient highways indicate the conversion and conquest of a wide slice of pagan seaboard by him.

Two hundred years after the saint died, in the eighth century, catastrophe came upon the district, and the sea began to throw up that remorseless sifting of its rocks and ledges deep under which lies to-day the land as it was then, its hills and its valleys now dimly suggested in the shifting shroud which gleams in the hot sunlight like a Nubian desert, and holds the land as far as it stretches in an irresistible grip. Whether the devastation was gradual or sudden can hardly be said with any certainty. It may well have happened that the ocean took the land by escalade, making at first insidious approaches to the grassy cliff-tops which rule round St Perran's Bay. Then, when the summit was on a slope with the shore, there may have set in a cycle of disastrous winter gales that, as they swept over the doomed country, carried with them, along with snow and hail, a blinding, all-engrossing sirocco of sand and shingle. There would be no striving against such a visitation. Grass and herbage must have disappeared in a night, while the wells and springs must have mocked the dusty throats of men and cattle. To stand and bemoan the desolation was to court the fate of Lot's wife, and to struggle against it by any stretch of human ingenuity to attempt a task to which the labours of Hercules were as child's-play. No doubt the Britons, stub-born-spirited then as ever, made as good a fight as they could; but the odds were all against them, and the artillery of the sea had inexhaustible stores of ammunition to draw upon. At first, no doubt, they wheezed and grumbled, mislaying their fish-hooks and harpoons as the shelly powder stood ankle-deep in the little ways between their huts; and then, as it swept in fiercely and more fiercely upon them with Atlantic spray and the white sea-spume, they mislaid their nets and their cabbage-beds and their weekly wash drying on what was left of the gorse and ling—and so on in an ascending scale till they mislaid their boats and their huts and each other; and then history shut the records upon them and mislaid them all herself!

For considerably over a thousand years the sand kept this curious story, and then, impelled by a new impulse, revealed its achievements of the age of woad and wolf-skin; and, parting to right and left, laid the oratory of St Piran bare, and disclosed the lines of shale-heaps running westward to the sea which it is suggested is all we shall ever know of this cathedral city of the reeds—this town that does not even boast a name. An antiquary both pious and eloquent, who saw the chapel soon after chance had disclosed it, observes: 'On the south side is the burial-ground, where there are scattered thousands of teeth and other human bones. Even whole skeletons lie exposed in regular order; and, strange as it may appear, the showers of sand which are continually wafted over this desolate spot scarcely ever alight on these melancholy relics of mortality. Hundreds and hundreds of skeletons have been exposed—destroyed by the shifting of the sand. The valley is full of the remnants of bones and teeth; they whiten the sands round the church, and instead of commanding pity and regard, they are cast up from their resting-places of ages and left scattered on the surface of the sand, dishonoured and insulted. Truly a sad spectacle.'

Meanwhile the April sun shines on this strange region, this sterile parish; within its limits life exists but on sufferance. There are colonies of watchful rabbits who thrive and multiply on little or no subsistence, spending their days and nights in honeycombing terraces and excavating

nests among the long-limbed Cornish giants down below. The peregrine falcons bring in their sea-booty, picking the bones of curlew and redshank on the tors, and screaming with the light shining through the barred plumes overhead to find their domain invaded by a curious wayfarer. A crow croaks defiance from the white ribs of a long-lost sheep, and the little birds of the marsh twitter to themselves in the sandy nullahs, roosting in those niches of the ruined chapel where perhaps the apostolic hands of St Piran himself stored chalice and cope, crucifix and chasuble, when King Arthur was more than a myth, and long before a Norman adventurer had ever landed on our coveted English soil.

Here Nature is in an idle and playful mood, and nearly every phenomenon of the universe is reproduced in miniature. Never did Oxus cut itself more gaily a new way to the sea than this rivulet between the tumuli shifts and turns and puzzles the troops of exploring insects. Here it is possible to lie under a chiselled door-stone between the showers and attend an open-air illustration of the theory of denudation, watching how every drop of rain helps to level a hill or fill a valley. The 'Great Mother' in this her play-room will deposit again an old red sandstone 'while you wait,' and illustrate how she worked her glacial drift and made her hill-terrace as we look on and smoke a cigarette. She scours the wastes with tiny desert winds that blind and stifle the patient caravan of beetles; whirlwinds a handkerchief could localise tear down the hollows; cañons, ramifying on every side, put to shame anything Colorado knows of; and ranges of shingle gleam in the sunlight overhead—local Silver San Juans—that are diminutively marvellous. She will even make light of fossilisation—sorts and re-sorts her materials childishly, turning the reflective snail of one morning into a Silurian ammonite before evening, and then rolls him back (not much the worse for the adventure), before breakfast-time comes round again, as contemplative as ever.

And over all these little incidents, and the records of the larger episodes that have gone before them, the spring violets nod to the fresh western breezes and the rushes whisper pleasantly, while the sun shines and the world seems to have forgotten—as, indeed, it has for the most part—all about St Piran, and how the sea which brought him holds him and his in a grip which, though light enough, there is no unloosening. A wider pall no bishop ever had, and his epitaph is written in the love of all good Cornishmen.

GIANT CIRCUMSTANCE.

CHAPTER II.—EHEU!

THE camp was still sleeping when the hunting-party rode softly away over the sand next morning.

They were all in the highest of spirits: Smith, because he was getting his own way and the chance of working some of the sand out of his blood. Then, too, he was in command—a small command, it is true, and for no warlike purpose, but it afforded him more enjoyment than all the figures that ever marred paper. Challis, because he enjoyed an outing as much as any man. He still felt a trifle run down with his literary labours; but he looked to the day's sport as a counter-active, and likely, in the result, to brace him up for the impending worries of the advance. The six troopers, because any change from the slow monotony of grizzling in a straw hut was to be jumped at and made the most of; and a sporting-party, above all things, meant good feeding, good-fellowship, and the chances of fun.

They were a somewhat mixed lot: Evans, a Shropshire man; Kent, a Cockney; Joynes and Preston, from Lancashire; Mackay, from Paisley; and Keogh, from Dublin—all men of good repute in their regiment, but none of them with any actual experience of fighting.

Smith was in command, of course, by virtue of his rank. The Colonel, however, in wishing them 'good-night and good sport,' had detained Challis for one second to whisper in his ear, 'Just see that he gets into no mischief, Challis. He's a bit heady, you know. If you should smell dervish ten miles away, come straight back; but I'm afraid there's no hope of that. The creatures seem to have dissolved into their natural dust.'

They swept gaily along in the cool of the early morning in order to reach the long *khor* between the hills by sunrise, the time when the sand-grouse comes down to the river to drink, and to meet sudden death if the sportsman knows his business and has got there before him.

They passed the farthest outposts and disappeared into the immensity of the desert.

The air was crisp and cold. It set their blood racing briskly, and tuned them, body and spirit, to keenest enjoyment.

Smith sang aloud in his glee old student-songs out of the *Commersbuch*, and the men rumbled out the choruses. It was all Dutch to them, but the tunes went with a swing and told of good-fellowship and joviality. They could not help but sing, and as to words, each man made his own.

They galloped past the riverside hills that looked plum-coloured from the camp, and drew in towards the ones that looked blue. They found the great *khor* Cameron had named, and sped along it towards the river, just as the sun shot up over the

eastern rim and flashed the sleepless sweep of the waters into sudden joyous life.

Then quickly to earth and a silent creep to the bank, followed by the envious eyes of the unlucky one who stood with his arm through the bridles of the eight panting horses, which snuffled and pawed to get down to the water.

Cameron was right. The great *khor* was a famous place for grouse. Smith spotted one covey of at least a dozen; Challis found another. Their two shots rang out together, and were followed by two more as the birds rose, and then by a wild fusillade from the men as a cloud like leaves in an autumn gale swept over them towards the rear. Six brace—not a bad beginning; and their mouths began to water at thoughts of grilled grouse for breakfast.

Smith waved the horse-keeper to follow, and then crept on along the river-bank.

Four more coveys they flushed by dint of much waiting and cautious approaches, and secured another six brace; and then they found themselves near the remains of a village, with appetites that would brook no longer delay.

It was a tiny place of half-a-dozen mud houses, with holes for doors and windows, roofs fallen in, and flitting lizards busy at hide-and-seek all over the place. A broken-down *zekia* stood on a ruined platform over by the river-bank, with the necks of its water-pots still hanging in the slackened loops. But the troughs were dry and twisted with the heat, and it was long since they had carried any comfort to the thirsty land behind.

A pretty spot too, as that country goes, with mimosa-trees that looked almost green, and a dozen stately palms, and patches here and there of stalky yellow grass where once corn waved and ripened and shone like gold in the sun. The river rolled past, smooth, silent, wonderful, a long, soothing stretch of it, leaden at their feet, with now and again a golden shimmer, blue in the distance, fading at last into a silver thread among filmy purple heights.

'We will stop here,' said Smith; 'and after we have eaten grouse we will bathe, and then we will ride home in the cool.'

'Suppose we climb that hill first and have a look round?' said Challis.

'By all means, Mentor,' laughed the other. 'It is useless labour; but there's nothing like being cautious.'

'Can't be too careful in a hostile country.'

'Even though it is only peopled by shadows,' laughed Smith. 'I'm coming to believe about as much in dervishes as I do in ghosts.'

So he gave his orders for breakfast, and the men set to work like schoolboys out for a holiday, feeding and watering the horses, scavenging ruthlessly for anything that would burn, lighting a fire, despoiling the birds of their pretty white and green and brown feathers and spitting them on sticks, and laying out the biscuits and knives and forks and flasks for the banquet. This was where the fun of the thing came in for them, and no single item of it but yielded all it held.

Smith and Challis climbed the rough hill, with an occasional backward glance on the cheerful scene below, and at last lay sprawling and panting on the top, where the sun struck fiercely at them out of a blue-white sky. Eight hundred feet is no great elevation, but in the desert it takes one a great way above the earth. They could see apparently to where the faded yellow edge of the world broke off sharply against the darker blue of the great beyond.

It was a very wonderful sight. Neither of them had ever in his life before seen so much sand all at one time. But it was a dreadfully dry and thirsty land, with not a sign of life or hope in it. Their own little oasis was hidden behind a projecting shoulder, and other bare shoulders humped themselves brokenly to the south, intersected by *khors* and gullies similar to the one down which they had come. The only redeeming feature was the majestic river, issuing silently from the blue void on the one side, sweeping silently past, disappearing silently into the blue void on the other side.

'Such is life,' said Challis, tritely enough, with a touch of the pensive philosophy that comes of much work and little play.

'Sight more like death,' said Smith. 'Don't you feel as if you'd like to lie in its way with your mouth wide open and let it all run into you? Let's get down, my dear. There's nothing to see up here. I don't believe there's a live thing in all the world but you and I, and the boys roasting grouse below, and I'm as empty as a drum and as dry as the desert.'

So down they went, sprawling and slipping and laughing, and Smith began sniffing for roast grouse before he had got half-way, and averred that he could smell it burning.

Breakfast was just ready, the grouse browned to a turn, the biscuits of an entirely new brand from those served out in camp, the whisky of a new and delightful flavour, the coffee odorous of Araby the blest, and they all fell to and enjoyed themselves exceedingly.

Then they humoured the shade of palm and wall, and lay smoking and chatting drowsily, while the shadows wheeled slowly on their centres, and the mighty wheel of life took a ponderous turn on its own account.

Then, after careful survey of the slow coils and eddies for lurking crocodiles, they stripped and plunged into the water, and splashed and shouted like schoolboys again.

And then, after bidding the troopers keep watch in turn—not that he considered it necessary, but simply as a vicarious sacrifice on the altar of duty—Smith lay down under the shadow of a palm-tree, in perfect contentment with himself and the rest of the world, and fell fast asleep.

Challis watched him drop off, and the humorous creases in his cheeks crumpled slightly at the oddity of his friend's unconscious actions; and then he dropped off himself also.

The men considered watching a work of supererogation; but, having received their orders, there was nothing for it but to carry them out.

'Ain't a blooming fuzzy within a hundred miles,' said the Cockney Kent. 'Howsomever—toss you for last turn, boys.'

They spun a coin, and he lost and was nominated for first duty. The rest followed suit, and the little gamble completed their enjoyment. The roster having been compiled, Kent strolled off and sat down under a palm which stood apart from its fellows and commanded a view up and down the river-bank, while the rest sought cover, chatted discursively awhile, and then, one by one, fell asleep.

It was then two o'clock in the afternoon. It was blazing hot, and everything was so still that the lizards resumed their interrupted games, and gaped at the strange men who slept with their mouths wide open and made curious noises in their throats. Now and again one of the horses fell off one leg on to another in its sleep, and woke up enough to whuffle the flies out of its nose with an angry snort.

It was so very still that more than once the drowsy sentinel was startled into sudden wakefulness by spasmodic cluckings and gurglings from the river-bank, as though Father Nile knew things not generally known and found in them reason for laughter. So strange and causeless were the sounds at times that more than once Kent got up to investigate, under the impression that some sneaking hostile must have swum down with the current and was taking his fun off him. When he found nothing he pelted the river with chunks of mud-wall, and went and sat down under his palm again. When his hour was up he wakened the next man for duty, reported nothing moving 'but the blooming river that snickers at you now and again,' and lay down and was sound asleep in a moment.

It was while Evans, the Shropshire boy, was on the watch that other things began moving.

It was half-past three and grizzling hot. The very lizards were asleep. Even the sand seemed to shrivel in the bite of the sun. The heat struck up at him from below as well as down on him from above. He had to hotch round his tree to sit on its shadow, which helped to keep him awake; and as he hotched one time his heavy eyes fell on something moving far away on the level between the hills and the river.

He rubbed his eyes drowsily and swore because they were playing him tricks.

He rubbed them again and sat looking over his knees at the black spots out there. Tricky thing that desert. You never know when you have it. Didn't he remember how one time they had sent him to fill his squad's water-bottles at a lake with palms and bushes round it, and when he got there deuce a bit of lake was there, and never a bush or a palm, just nothing but sand, and yet he could have sworn——

Then he jumped up in a sudden cold sweat in spite of the hot smiting of the sun. The moving specks had spread into a line and were coming up fast. He fired off his carbine as the sharpest alarm, and ran shouting towards the mud houses. The others were on their feet before he got there.

'Niggers!' he yelled at them. 'Clouds of 'em. Horses, quick, or they'll nip us.'

Smith and Challis were already in the open. Behind them, saddles were slapping on to startled horses, and bits snapping into sleepy mouths, and girths were being buckled anyhow by hands that shook somewhat in spite of their owners. For the alarm came sudden, you see.

'Steady, men, steady!' said Smith in a firm, official voice. 'Are you ready? Prepare to mount!—Mount!—And ride like the devil!' he added unofficially.

Not a minute too soon. Not soon enough by several minutes.

A wild, discordant yell and a scattering volley ripped out from the bristling mob of horsemen, as they came whirling along in a cloud of dust. Very demons they looked, flying white robes, twisted black faces, flashing spears and gun-barrels, and fierce, white-rolling black eyes full of fiendish hate and cruelty, both horses and men.

A moment of wild confusion—yells and the buzz and spat of bullets, jerking oaths, plunging horses and scrambling men—and they were off—some of them.

Challis's big bay started before his toe was fairly in the stirrup. He hopped after it on one foot, with wild bounds but small hope of escape. He managed to grip saddle-bow and cantle, released his foot, and dragged himself on his chest across the plunging horse. The bay went off at speed, he like a sack across it, which probably saved his life, for the black men fire high. He got broken glimpses of speeding figures ahead, wriggled up on to his horse by degrees, and at last got his right leg over and felt himself again.

All hell seemed loose behind him and coming on like a screaming whirlwind. He drove his spurs into his horse, which needed no such encouragement, and found time to look about him.

One—two—three—four in front, and, close behind, the quick beat of galloping hoofs told him the others were not far away.

Glancing round, he saw the straining head and wild eyes and flattened ears of Smith's big gray creeping up on his quarter.

Then a jingling clink of empty stirrups shot fear through his heart like a bullet. He turned in his saddle.

The bay was riderless. Smith was down.

Instinct tightened the rein to turn and seek him.

But there was no sign of him. Nothing but that cloud of black furies racing as fast as their winded horses could go, and screaming at top of their voices.

Five in front, fifty behind. It was hopeless. Nevertheless, he wrestled his revolver out of its case, and shouted to the men in front.

One turned his head for a second, then spurred the harder. The others never looked round. They probably never heard him.

With difficulty he checked his horse, for its nerves had the better of it still, and faced the oncoming crowd. He fired into it, but might have saved himself the trouble. Some equally useless shots came back.

He understood dimly what lay before him.

There was no possible mistake as to what lay behind him.

He was sorely tempted to take the latter.

It would be simple suicide, but it might be preferable. It would certainly be the easier thing of the two, and as a rule, at a pinch, the easier thing is the wrong thing. He had but the fraction of a second to decide, very much less time than it takes to tell of it.

He turned and gave his impatient horse its head, and life turned on his horse's heels to bitter dust and ashes.

For he saw in a flash all the sequence of trouble that would follow. Rightly or wrongly, this man's life would be required of him. He would be held responsible, and no explanations would suffice to cover so dire a disaster.

It would be easier—oh! so much easier—to ride back among the slackening screamers behind and die there. But it would be utterly useless. It would simply be shirking. He must face the music, and the tune was 'The Dead March.'

He was conscious of no wrong. He did not see what single thing he could have done different from what he had done—except die. And he knew that it would be cast up against him that he lived.

He lifted his twisted face to the pitiless blue-white sky, and the anguish of his mind stamped years upon it. And for one terrible moment there was in his heart, and almost in his throat, an inclination to incongruous and scornful laughter at the perverse imbecility of things. Then his chin dropped on his chest, and he wished again that he had died by the mud houses.

His horse carried him unchecked after the others, but he saw nothing of them till he rode into, and almost over, a group of two round a horse lying on the sand. Its rider was trying to get it up on to its legs again; but the blood was running out of a hole in its shoulder, and it was done. Its head bumped heavily and its hind-legs gave their last convulsive kicks as he came up.

Mackay and Kent—Kent with the reins still in his hand, the other glancing sharply backwards and forwards and anxious to be off. The pursuit had thinned down to a comet with a lagging tail.

'Where are the others?' asked Challis.

'Streaking for home as fast as they can pelt, sir,' said Kent disgustedly. He had been streaking himself until his horse gave out.

'Take that man's stirrup-leather and come on. I'll catch you the gray;' and he set spurs after the Prince's horse, caught it by the hanging reins, and held it till they came up. The holster-strap across the saddle-bow was broken. It looked as if some hurried hand had grasped it and it had failed him. Kent scrambled up and they went on.

'Is the Prince down, sir?' asked Kent when he found himself on the gray.

'Yes,' said Challis through his teeth; and thereafter they went in silence.

It was a simple and natural question, the first of the many he would have to answer. But it seemed to his tight-strung senses to carry an implication of reproach, and it brought home to him the bitterness of what was coming.

One by one they passed in silence the landmarks they had left behind so gaily in the morning, brimming then with hope, and life all fair before them. Now, for their leader at all events, the death that lay behind seemed the fairer, and the life that lay in front was blacker than death itself.

For every dull thud of his horse's hoofs on the sand beat into his brain the certainty that some one would have to pay, and that the reckoning would be his. Had he not detected in this man's question the ring of the demand that all the world would be making on him to-morrow? It might be unjust; it might be unmerited; but it would be made all the same, and the very asking was a scar on his reputation.

While still a couple of miles from camp they saw a troop of riders hurrying to meet them.

The Colonel was at their head. His face was grim and cold as a death's head. He looked suddenly pinched and old, and Challis saw him scan them keenly as he rode up, and noted the quiver of his lip as he asked abruptly, 'Is this all?'

'This is all, sir.'

'And the rest?'

Challis shook his head.

'For God's sake, Challis, don't tell me that boy is killed! My God! My God! I would have died a hundred times sooner than have this happen.'

And Challis felt as if the old man had struck him, and realised once more that sharp death by the mud houses would have been infinitely sweeter than this. But he knew also, as the Colonel could not know, and never would be

brought to know, that his own life given a hundred times would not have saved that other life out there.

'Is there no chance?' asked the Colonel, tense irritation burying the fall of his hopes.

'No chance, I fear, sir. We can go and see. They were fifty to our eight, and were on us before we knew. Will some one lend me a horse? Mine can't do it again.'

'Give him a horse, one of you,' said the Colonel, and waited impatiently while one of the men slipped off and Challis mounted in his place.

'Now,' snapped the Colonel, and turned abruptly and shook his horse into a gallop, and they all pounded after him. Just so would the world turn its back on him, said Challis to himself bitterly and sadly. He had no single thing to reproach himself with—except, indeed, that he had chosen to live when to die would have been the sweeter; but his head must fall all the same. It was hard to fall, even clean-handed, and it would have been so very much easier to die.

Not a word was spoken, save for necessary directions, as they rode down the great *khor* and along the river-bank, till they came to the mud houses.

And there they found the others. Evans out in the open. He had made a hopeless run for it, but the thirsty spears had caught him. He was jabbed to pieces. The other two were not visible. A spark of hope glimmered in the Colonel's eye again.

But Challis was off his horse and into the houses. Others followed. In a moment there was a shout of 'Here, sir!' and the Colonel's hope died finally.

The gallant lad had fought for his life, but the fight had been sharp and short. In the darkest corner of one of the dark little mud rooms the light of the Saxe-Hohenburg-Eisenachs had gone out for ever, but it had gone undimmed.

They lifted him tenderly and carried him out into the waning light, and stood around him with uncovered heads and saddened faces. Like the other, he was pierced with many wounds, but he had died with his back to the wall, and all his wounds were in front.

The other man, Preston, they found in similar case in an adjoining house. Both had died by steel, and were sorely hacked about.

The Colonel's gray face looked grayer than ever. The men were very sober. They moved quietly, spoke in whispers, noted the holes and grooves of the bullets, and the flakes they had scored off the mud walls. One of them picked up in a corner a bunch of the pretty little birds whose lives had been so dearly paid for, and carried them home, and he and his fellows supped well that night.

Challis's face was white and hard-set. This sad thing lying so quietly on the sand was sad enough, in sooth, but he was seeing sadder things to come. For the man who has died gallantly fighting odds is done with his troubles; and the man who must fight for that which he holds dearer than life, against odds which are beyond him, has all his troubles to come.

They made a quick reconnaissance of the hills and *khors* beyond, but the enemy had vanished as quickly as he had come. The light was going, and they must get back. They made hasty litters with coats and carbines, and turned and went slowly and sadly home. The longest, darkest ride Challis had ever had. For the Colonel never opened his mouth the whole way.

KING COFFEE.

ET no one imagine from the title of this article that any allusion is made to the sable monarch of the golden stool and capacious umbrella who involved us in one of our little wars some thirty years ago.

Many of us remember the phrase 'Cotton is king,' which was current some forty years ago, during the American Civil War. The Southern States then held (as they still do to-day) a practical monopoly of the cotton production of the world; and when they seceded from the Union, and had to suffer all the rigours of a blockade which shut them off from the markets of Europe, they imagined that the Great Powers would interfere on their behalf as soon as their wonted supplies of cotton were cut off. This hope proved vain, for in spite of the sufferings of the Lancashire operatives and the privations of the general British public, the power of 'King Cotton' was not found sufficient to break the blockade.

The position occupied by Brazil in the world of coffee is similar to that held by the United States in the world of cotton, for the former country, which has been favoured by nature in so many ways, has a virtual monopoly of the world's coffee production. It is true there are many other parts of the world where the fragrant berry is produced; but the total production of all other countries combined falls far short of that of Brazil. It is certain that if any one were in a position to 'corner' the entire coffee-crop of Brazil, he could command his own price in the coffee-market.

We in England are apt to underrate the importance of coffee as a staple product, because we are not great coffee-drinkers. Not only is the consumption of coffee *per capita* much less in England and the Colonies than in the United States and the continent of Europe, but it is said to be actually on the decrease in this country. Besides, the British, unlike their Continental neighbours,

prefer to take their coffee with a large admixture of chicory, thus further reducing their demand for the Mocha berry.

This diminution in the consumption of coffee is rather to be regretted if it is true, as is said, that the use of the fragrant decoction to a great extent counteracts the craving for stronger beverages, and that among coffee-drinking nations the average amount of intemperance is small. Some colour is given to this statement by the fact that in countries such as Russia, Australia, and (mention it not in Gath !) Great Britain, where tea-drinking is general and coffee almost boycotted, the amount of intemperance is above the average. In the case of China, where the conditions are so widely different in all respects from what prevails in Caucasian countries, this comparison of course does not apply. Can it be that the decreased consumption of coffee among us is responsible for the increase of intemperance which is proved by statistics to have taken place of recent years?

In Rio de Janeiro and Santos, the two great coffee-shipping ports of the world, the London market is held to be almost a *quantité négligeable*, and greater importance is attached to New York, Havre, and Hamburg, which are the principal markets for the disposal of their produce. While the United States take a vast quantity of coffee from Brazil, they send comparatively little merchandise or produce to the latter country in return. Owing to this fact, the vessels which carry coffee from Brazil to the United States, not being able to find a remunerative return cargo, are forced to adopt the system of 'triangular trading'—that is to say, these vessels, mostly British, start from a British port with a general cargo for Brazil. In Rio or Santos they load up with coffee for the United States, where they unload their coffee and take a cargo of cotton, wheat, or other produce for England, thus making three trips on each round voyage.

In Rio de Janeiro and Santos there are commercial agencies which make a specialty of forwarding every day (and even twice a day) to the principal coffee-markets of the world telegraphic reports, such as 'spot quotations' for coffee, condition and prospects of the crop, visible local supply, &c., which information enables European dealers and speculators to fix their prices. These prices are in their turn telegraphed back to Rio and Santos for the benefit of the coffee exporters, and no indication is lost sight of which may influence the price of the berry to the extent of a farthing a hundredweight.

The manner in which these telegrams are made out is interesting and worth mentioning here, especially as it applies not merely to coffee but to other staples of world-wide importance. The manager of the commercial telegraph agency in London, let us say, receives a telegram in cipher from Rio. On referring to his code-book, he finds that each word of the cipher telegram stands for a group of figures. Let us suppose that the first word in the telegram is 'graduador.' On turning to the alphabetical index in the code-book, we find that 'graduador' stands for the group of figures 18820343. Now, each figure in this group is a message in itself. It is understood, for example, that the first figure represents a report on the state of the weather, the second stands for the condition of the local market, the third for prices obtainable, and so on. Each of these reports in the code-book consists of, say, ten sections, represented by different figures ranging from 0 to 9. Thus, if the manager wishes to find out the state of the weather at the other end, he takes the first figure in the group, which is 1, and on turning to the weather-report tabulated in the code-book, he finds that the number 1 stands for 'fine and dry.' The second figure (8) stands for the state of the market, and means 'without change from our last report;' and so on, each figure standing for a complete message. It will be seen that the single word 'graduador,' after it has been translated and 'expanded,' will supply sufficient information for the preparation of quite a long article on the coffee-market and coffee-crop of Brazil. The commercial agencies obtain good value for their money, and cannot complain even if cable charges are high. Yet, ingenious as this plan is, there are other methods of still further economising cable expenses which it would be tedious to detail here.

In proportion to its population, there is perhaps no part of the world which takes so much coffee from Brazil as South Africa. The Dutch are known to be great coffee-drinkers, and their descendants in South Africa must be still more so if one is to judge by the number of vessels (several every month during the season) which leave Rio and Santos for Capetown, Port Elizabeth, and other neighbouring ports; for the English-speaking part of the population does not consume coffee to the same extent.

Of the twelve million bags of coffee which form the world's annual production, at least two-thirds are furnished by Brazil, and of these by far the greater portion are shipped from the ports of Rio and Santos. The latter port owes its phenomenal rise almost entirely to the coffee industry, and of late years has taken away a great deal of the trade from Rio de Janeiro. In the year 1901 no less than nine million six hundred and thirty-three thousand five hundred and fifty-three bags (of one hundred and thirty-two pounds each) were shipped from the port of Santos alone, the imports at the same place in the same year amounting to ninety-four and a half million milreis. If we take the milreis at a shilling, this is equal to nearly five million pounds sterling. It is doubtful if there is another town of the same size (about fifteen thousand inhabitants) in the world which can show such a large trade, especially when it is remembered that this importation is all for local use and not a mere transit traffic.

There is no part of the world where the coffee-growing industry has become so strongly centralised

as in the Brazilian state of San Paulo, of which Santos is the seaport. The rapid growth of the city of San Paulo (the Brazilian Chicago), which claims already to have a population of more than two hundred thousand inhabitants, is due to the same cause. The immense export trade of Rio and Santos is composed almost entirely of coffee, and the 'coffee belt' of Brazil—composed mainly of the states of San Paulo, Minas Geraes, and Rio de Janeiro—is the richest and most progressive part of the country, much more so than the unhealthy rubber-belt of the Amazon basin or the sugar and cotton belt of the north-east. The climate of the coffee-country is also, as a rule, temperate and healthy; for, although the port of Santos is notoriously a hotbed of yellow-fever, the uplands of the interior, where the coffee is grown, have a much cooler climate, which is both pleasant and salubrious. So terrible have been the ravages of 'yellow-jack' that at one time the harbour of Santos was almost entirely deserted and full of ships laid up through being unable to obtain crews. There had been a virulent outbreak of the epidemic, and those sailors who had escaped with their lives had fled for fear of contracting the disease. Seafaring men, as is well known, are peculiarly liable to this dreaded disease. However, yellow-fever, which is chiefly confined to seaports in tropical and semi-tropical climates, is due in great measure to defective sanitation, and when this cause is removed the epidemic generally abates or disappears altogether. In Santos greater attention has been paid of late years to proper sanitation, and the health of the port is said to have improved greatly in consequence.

In the state of San Paulo is situated the celebrated Fazenda Dumont, which claims to be the largest coffee-plantation in the world. This valuable estate was formerly the property of the Dumont family (of which M. Santos Dumont, of navigable balloon fame, is a member), but was floated some years ago as a joint-stock company with a capital which ran into seven figures. The Fazenda Dumont is one of the sights of Brazil. It is dotted over with prosperous villages of workers, and has its own line of railway, and a unique installation of machinery and plant for the preparation of coffee for the market.

It is not to be wondered at that Rio and Santos should ship so much coffee and scarcely anything else, for there is perhaps no crop which is so certainly lucrative. During the last few decades, when nearly every other agricultural product has fallen in value, coffee has maintained its price, or at least has not fallen in equal proportion. A hundred acres of land planted in coffee will give a large and certain income, at any rate of several thousand pounds sterling a year. Of what other product of a temperate climate can the same be said? Coffee-planting, however, is not an industry for a poor man; the coffee-planters are capitalists, and the plantations generally on a large scale. Land suitable for the cultivation of coffee, not too far from a railway or other means of communication, is excessively dear; while the machinery and plant necessary for treating the coffee are much more expensive than one might imagine. When it is added that the coffee-planter (unless he buys a plantation in bearing) must wait at least three years for his plants to come into bearing, and still longer to obtain a full crop, it will readily be understood that only a man of means can engage in the industry with a reasonable prospect of success. Indeed, a sum of ten thousand pounds sterling is none too much for any one who thinks of engaging in coffee-cultivation; besides which, of course, some experience is necessary.

There are few plants which are so sensitive to climatic conditions as coffee, which requires an equable and (unless where irrigated) moist climate, with an average temperature of about sixty-five degrees. Its cultivation is principally confined to districts within the tropics at an elevation ranging from two thousand to six thousand feet. It will be seen, therefore, that the plant, though grown within the tropics, does not thrive in a tropical climate, for at the elevation indicated one may find a temperate climate even on the equator. Frost is very injurious to the plant, as is also drought. Some years ago great expectations were raised by the cultivation of Liberian coffee, a variety which can be grown successfully in tropical climates at the sea-level; but although Liberian coffee gives an abundant yield, the quality of the berry is very inferior, and it has not realised the great expectations which were placed on it.

In view of the recent proposal to impose a preferential tax in favour of colonial produce, it may be interesting to note that such a tax existed on coffee sixty years ago. In the year 1843 (or, to be more exact, the year ending January 5, 1844), when the total amount of coffee imported into the British Isles was fifty million pounds, foreign coffee paid a duty of sixpence per pound, while colonial coffee only paid fourpence. Yet, in spite of this differential tariff, the greater part of the coffee imported came from abroad; the figures being, from British colonies, twenty-three million two hundred and thirty-five thousand one hundred and two pounds; from foreign countries, twenty-seven million one hundred and forty-two thousand eight hundred and thirteen pounds. The chief colonial sources of supply in that year were Ceylon (sixteen million pounds) and Jamaica (five million pounds). In Ceylon, which was formerly such an important coffee-growing colony, the industry has been almost ruined by the spread of leaf-disease, though great hopes are held out that coffee-planting will again prosper through the introduction of Liberian coffee.

THE BLACK SPIDER.

CHAPTER II.—THE GARRALUNGA BANK.

THERE is a small township near the Barrier Range Mountains in New South Wales which for the purposes of our story may be called Garralunga, though that is not its real name. It is what in England would be known merely as a village of some five hundred inhabitants; but in the country districts of Australia such settlements pass under the more imposing title of 'townships.' It owed its birth (a very recent event) and rise (a very rapid one) to its proximity to the lately discovered silver-mine known as Silver Store; and the prospects of the company which had successfully floated and developed the enterprise were bright indeed. In the township which sprang up with mushroom-like swiftness near the mine a bank speedily became a necessity, and the Home and Colonies Banking Company, with acute foresight, were the first to seize the vacant place and establish a branch at Garralunga.

One year before the opening of this particular branch, Frederick Lane had landed at Sydney and sought employment in that huge capital of the province. For some weeks he had a hard, uphill fight, barely earning enough by intermittent manual labour to support himself. Then, by one of those strange and happy chances which do sometimes occur, Fortune seemed to think she owed some little reparation for all the hard knocks she had lately given him. He came across an old friend of his father who had emigrated to Sydney ten years previously, and was now a prosperous wool-merchant. Frederick Lane told him how he had come out to the new country hoping to find better chances of success than the old land had afforded him. But he carefully refrained from mentioning the episode of his arrest, trial, imprisonment, and the subsequent discovery of his innocence. For it was only two years after the transportation of convicts to Botany Bay and Van Diemen's Land had been discontinued by Great Britain. There were large numbers of ticket-of-leave men in the colony, and it was an awkward thing to have to admit that you had been in prison for a sentence of five years' hard labour. As for the release on a pardon and the proof of your innocence, why, that was easily said, but not so easily confirmed. Six months, or close upon that time, would be required to write to England, make the necessary inquiries, collect official documents, and transmit them to Sydney; and meantime the coveted employment would be lost, for no employer would wait six months when the supply of men eager to fill the vacant post was so large. No; all things considered, Lane felt sure he acted prudently in keeping silence about that miserable time in Portbury Convict Prison.

Mr Ensor immediately interested himself in the son of his old friend, and before many days had passed, obtained for him a post as junior clerk in the Home and Colonies Bank at the chief office in Sydney. The wool-merchant was one of the largest customers of the bank, and always kept a large credit account there, so his influence easily procured the post for Frederick Lane. The commencing salary was small, but it was enough to live upon—with strict economy—and the work was thoroughly congenial to Lane; and when the new branch was started at Garralunga the head-clerk at the chief office, who was selected to take charge of it, asked that Lane might be sent with him.

'I've kept my eye upon him, and he's the right sort,' said this official to the managing director. 'Young Lane is quick and intelligent, not afraid of plenty of work, and leads a very steady life. I wish I could say as much for all the others under me.'

And so it came about that Lane found himself at the small township near the Barrier Range.

'How do you like the life here?' asked his new superior a few days after their arrival. 'Rather a change from Sydney conditions, isn't it?'

'I should use the Yankee's word, and speak of it as "considerable," Mr Williams,' answered Lane. 'One misses the strenuous rush and incessant work of Sydney life; but Garralunga certainly is not wanting in excitement. I heard of a duel between two miners only this morning.'

'Ah, such little affairs are not uncommon. What was the result in this case?'

'One man winged, as they call it; the other escaped untouched. Hallo, Mr Williams! what's the matter?'

For the manager had taken a rapid step forward, wheeled suddenly half-round, and then stamped one foot on the floor.

'One of those hateful black spiders,' said the other as he removed his foot and pointed to a dark patch. 'He nearly dodged me, but I just got him in time to stop him from running beneath the safe.'

'You object to spiders?' said Lane, smiling.

'To the black spider I do, most strongly; and so, I imagine, do most people with the average allowance of sanity. If you want any further reason, get yourself bitten by the next one you come across, and when you've recovered from your illness you won't ask again. You'll be quite satisfied.'

'Poisonous, I suppose?'

'Yes; but not necessarily fatal, nor even in the majority of cases. Deaths do occur from their bite; but there is usually some contributory cause, the doctors say: want of vitality sufficient to resist the poisonous effects, as in the case of very young children; or an unsound state of health—a habitually intemperate man, for instance. Anyway, my

advice to you is to go for one whenever you see him; but take care how you do it. They will fight if driven into a corner; that's only natural. You can always tell the particular kind by the one red spot on his back.'

'Australia seems to have some peculiar characteristics of its own which we don't possess in England.'

'You mean our black spiders, for instance? Well, yes, they are nuisances, I admit; but with a little care and watchfulness we can generally get rid of that institution, as you call it. I wish we could as easily stamp out our "sundowners."'

'Why, what are they? It's a remarkable name.'

'Haven't you had the polite attention of a "sundowner" yet? Oh, you will fast enough if you have any outhouse, or stable, or the like where you lodge. A "sundowner" is very much the same as your English tramp; only rather more so. He comes to your place about sundown (sunset you term it in the Old Country) and asks for a night's lodging; which of course means something more in the way of supper and breakfast.'

Frederick Lane gave a long whistle of surprise.

'He wouldn't get it from me. Why, a pretty state of society it would be if one had to keep open house for every skulking loafer who wanted all that. I should feel strongly inclined to kick him off the premises as a warning not to try the same game a second time.'

'By all means, if you like to,' said the manager dryly. 'Australia's a free country, and I don't know of any law to prevent you. Of course, you must look to have your house or stables burned down very soon afterwards, and never be able to find out who did it. Seriously, my dear Lane, you evidently don't know the power of these fellows. It's a dangerous thing to refuse them what they ask. There is many a man who has bitterly regretted his folly in not giving the "sundowner" what he wanted. Understand that they don't ask for money as a general rule, only for permission to sleep in some outhouse, barn, or stable, and for a ration of mutton, damper, and tea. Perhaps one may beg a screw of tobacco as well; if so, take my advice and give it him. Off he goes in the morning and no harm done. These lazy rascals have a regular Freemasonry among themselves, and have established their institutions so firmly that it is really dangerous to resist them in country districts like Garralunga.'

'Well, I suppose I must fall into line with the customs of my new country,' observed Lane. 'But, as I said just now, I don't admire some of them.'

'We have to put up with many things in this life which we don't admire,' was the philosophic reply. 'What can't be cured must be endured: old age, for instance, or one's mother-in-law.'

A HOLIDAY IN RUSSIAN POLAND.

By FREDERIC VICARS, M.D.

S the heavy train steamed slowly into Alexandrowo it was boarded by the railway gendarmes, big, rough-looking fellows, all armed, who muttered, in guttural tones that sounded like a curse, the magic word '*Passporte*,' without which it is impossible to enter or depart from the dominions of the Czar. Descending from the carriage, I betook myself to the great waiting-room, and went through the ordeal of having my luggage inspected. The examination is conducted in no very regular fashion. Sometimes one's packages are hardly looked at before the official stamp is fixed to them, freeing one from further trouble; at other times the authorities appear to make a raid upon the luggage, and trunks and portmanteaus are overhauled with an energy that almost develops into a frenzy; and woe betide the unsuspecting purveyor of *articles de luxe* or *nouveautés de Paris!* He or she must pay through the nose for them, or leave them behind. Once inside Russian territory, one is in the dominion of suspicion, and at the frontier the passengers are keenly scrutinised by certain crafty-looking individuals, who eye each with sidelong glances while moving slowly up and down the platform. These are the spies of the secret police on the outlook for Nihilists or other suspicious persons. Among these latter, I may mention that I knew two British officers who went to stay in a Polish house on different occasions, the one *en route* to Russia Proper, the other on a visit to his sister, an English lady who had married a Pole. Each of these was followed from the frontier to his destination by a gendarme, and during the whole time of their stay in Poland one of these officials remained in the vicinity to watch their movements.

During a journey of seven hours and a half from the frontier, I passed through the most dreary and uninteresting country it is possible to find in a civilised land. The monotony of the view on either side of the train is extreme. Mile after mile of flat, poor-looking soil stretches away to the horizon. One might just as well look at the carriage roof above as look out of the window. I was truly glad when I arrived at the station of P——, near Warsaw, and found my hostess, Madame D——, waiting with a comfortable victoria to drive me over the six miles of sand and rough road to a charming modern-built house, where I was to stay some five weeks. As we left the railway the country looked more inviting. Clumps of poplars and beeches stood out of the flat land, and two small villages were passed. The houses were entirely of wood and of one story, and

were whitewashed and had thatched roofs. The latter were certainly in better repair than similar ones to be seen in the country districts in Ireland. While mentioning Ireland I may remark that there is a striking resemblance in the appearance of the flatter districts and their peasantry to Russian Poland and its poorer inhabitants. That, I think, is the first thing which strikes an observer who has been in the two countries. The bare-footed peasant women look just the same in their picturesque coloured skirts and red-spotted handkerchiefs tied over their heads; but under the red handkerchiefs in Poland one never sees a beautiful face as in Ireland. A broad, flat, coarse face, with high cheek-bones and a sulky expression, are the characteristics of that part of a Polish peasant woman that is half-hidden under the picturesque headgear.

The house at W——, where I stayed, was a two-storied stucco building with a low, sloping roof. Everything inside was arranged in thoroughly English fashion, from the milking-stool tables to the wooden overmantels, all the especially English designs being copied from the illustrated advertisements in an English lady's newspaper by a clever village carpenter under the direction of the lady of the house, herself an Englishwoman. Eastern embroideries and English chintz covered the big arm-chairs and comfortable divans, and a hanging Japanese reed screen separated the drawing-room from one of the cosiest little boudoirs I have ever seen. Here I used often to sit and read for hours when it was too hot to go out of doors, reclining on a soft couch with a goodly pile of fragrant *papierosses* by my side, and a delightful black poodle as a footstool. Nothing could be more pleasant for a time than the days I spent at W——, lazy, uneventful days, truly, but days of the most perfect rest to one who wanted such. The heat was intense—ninety degrees in the shade—and active exercise was most unwelcome during the first weeks.

A late breakfast and unlimited lolling on the veranda would occupy the time lazily till the midday dinner, one's appetite being whipped into action by a small glass of *vodka* and a *pszkaska*, the latter consisting of some kind of *hors d'œuvre*, an olive sandwich or an anchovy. Polish cookery is always inviting. It is richer than the French cookery, and some of its daintiest dishes, I believe, owe their origin to the Jewish *cuisine*. However delicious the cookery may be to the palate, it is certainly very indigestible. Indeed, one has only to look at the faces of the people to see that. One rarely sees a person with a good complexion, especially amongst the women, the exceptions being almost entirely confined to the Jews. There is another reason for this unhealthiness. Amongst the well-to-do classes there is very little outdoor exercise taken. Every one drives. In Warsaw the *droshka* are very cheap, and carry fares about very rapidly. The best cabs have two horses, generally in capital condition, and they dash along the streets at a tremendous pace.

In the country people drive in a *bryczka*. The simplest form of *bryczka* is an oblong box on four wheels, without springs, and having two seats without backs. It is drawn by two horses. The jolting is terrible until one gets used to it, and then, strange to say, one rather likes it. A drive in a *bryczka* is considered good for the liver. It may be, but I am inclined to think the nervous system suffers from the intense jarring of the spine. With the exception of the '*bryczka* liver-cure,' there is very little outdoor movement. Lately, however, bicycles have been introduced, and with them bicycle races, so there is a tendency, among the male population at least, toward athletics.

There is a general disposition to take life easy in Poland. There are no great efforts or undertakings. There is no public service for the Poles; all the government is, of course, in the hands of the Russians, and red-tape is only untied by the payment of roubles. There is no room for ambition in such a country, and yet the Poles have an intense love for their country, a kind of earth-hunger, for there is little else in it but the earth. With the peasant one can understand this, for he is, in Russian Poland, a simple animal; he never rises from his lowly condition, nor has he the slightest desire to do so. As long as he can eat and drink and go on living in his cabin he is content, and is not to be coaxed out of his happy state of contentment by any efforts of would-be philanthropists. With the upper classes the old patriotism and anti-Russian feeling still remains strong; but the complaints one generally hears of are more against the minor officials and their peculations than against the central authorities. In the country districts, in the houses of the landed proprietors, the old patriotism is more *en evidence*, but it is all quiescent, and seems only a memory of something that once lived and is now dead and gone. In Warsaw Society occupies itself in initiating a new *mode*, which is a sort of conglomeration of manners and customs of the English, French, and Austrian nations. The latter has come into favour lately so much by reason of the Carlsbad waters, which the well-to-do Poles go and drink every year. Not a bad reason, surely; for a country that makes you feel in better health after a month's sojourn there certainly has some claim to your affections. I suppose I shall be told that there is another reason for this Austrian attachment, but I prefer to attribute it to the virtues of the Carlsbad waters. Warsaw during my holiday was a most undesirable place, and I went there only a few times, for the atmosphere was stifling and bad odours abounded.

The restful life at W—— was occasionally varied by an expedition to another part of the country. One of these was a journey to O——, a beautiful country-seat not far from the frontier of what is known as the 'Kingdom of Poland' and Russia Proper. We went to buy cattle, and stayed the

night there. A long, dusty journey of eight hours in the train brought us at three o'clock in the afternoon to Biala. Here we found a carriage waiting, with four horses of unequal size, sent to meet us by Monsieur Z——, our host, from whom my friend D— proposed to buy cattle on the morrow. We packed ourselves inside, and started on a journey of twenty-eight miles in the broiling sun. On the box sat the Polish driver and a big Jew we had brought with us to look after the cattle. Away we went over miles and miles of white sand, which rose up in a cloud behind us, and covered us with a thick layer. We passed several villages, mostly Jewish, where we drank delicious draughts of the light Polish beer without any unpleasant after-effects. One remarkable place we passed was a village of Russian peasants colonised by the Government. It was a most weird-looking abode. As we approached at a rapid trot our coachman drew attention to a small cemetery on the left, just at the entrance to the long line of cottages that constituted the village. Several broken wooden crosses stuck crookedly out of the ground, which was enclosed by dilapidated banks. It was the cholera cemetery of the last epidemic. As we rattled through, the inhabitants, people and pigs, turned out to look at us. I had never seen such horrible-looking people before. All were women, and all seemed aged hags. Taller than the average Polish women, with a short, loose white blouse gathered in at the waist by a band, and reaching as far as the knee, these bare-legged creatures stood and stared at us as we passed. I shall never forget their faces. They all seemed cast in the same mould; a yellowish complexion, with large, broad features and staring eyes; long, straight gray hair hung down to their shoulders, and was cut square across their foreheads; and on the tops of their heads each wore a ring which, our driver explained, was of wood covered with cloth, and which was fixed in its place by strands of hair tied to it. They were a ghastly company indeed as they stood and gazed, each a diabolical replica of the other. So rapidly did we drive that we were hardly in the village than we were out of it, and beyond the view of those horrible-looking females. It was like a nightmare in broad daylight, a vision from Dante in the blaze of the afternoon sun.

It was dark when we arrived at O—— and drove up to the fine house, where our host received us with effusion in true Polish style. A small boy at once began scrubbing us with a huge clothes-brush, and the dust from our coats raised quite a mist in the hall. I thonght, of course, that we should be conducted to our rooms to wash and clean ourselves generally before being presented to the other members of the family, but such was not the case. Our genial host at once conducted us to an inner room, and introduced us to his wife and four gentlemen who were playing cards. Polish hospitality doubtless did not permit of the thought that guests could possibly be dirty even after a dusty drive of twenty-eight miles in the height of summer.

My readers will perhaps imagine that we spent a pleasant and agreeable evening, and drank toasts all round. We did nothing of the kind. I grieve to record it, but we spent the dullest evening I think I ever spent in Poland. In vain did our host open various bottles of curious vintage and press them upon us. We quaffed, but more or less in silence. He talked of cows, of sheep, of pigs, of matters agricultural. We could not rise to the occasion. Unwashed we sat, and unwashed we felt, like two sweeps at a banquet. At last time came to our rescue, and we crept off to a bath and our beds, leaving the rest of the company to the fascinations of 'poker.' The next morning we asked the man-servant if the others had gone to bed late, and were told that they had not gone to bed at all, but had played cards the whole night through!

My friend D—— bought eleven cows at a fair price, and by noon we departed, driving back more rapidly than we had come, for Monsieur Z—— furnished us with a splendid team of horses. We took leave most warmly, and wished each other *au revoir* with many compliments. Leave-taking in Polish country-houses is somewhat formidable. You shake hands in the drawing-room or dining-room, you do so again in the hall, then again at the door, and finally when you are seated in your carriage. Somewhere between these hand-shakes you have to perform the necessary duty of tipping the man-servant. You must choose your opportunity with discrimination, or you may find yourself slipping a piece of paper money into your host's hand!

At W—— our life was quiet enough, though visitors occasionally dropped in. I remember one young lady telling me that she sometimes opened her bedroom window to let in air after the English fashion; but when she did so her mother would come in and exclaim, in an outburst of Polish patriotism, 'Why make England in Poland?'

This was, of course, in winter, when, as a rule, windows are carefully sealed up till the summer. The result is not always pleasant; but there is no such thing as a cold room, however frigid the weather is outside. In winter there are two temperatures a person has to become accustomed to: the warm temperature of the entire house and the intense cold outside. In the house people are reasonably clad, and wear no uncomfortable thick under-garments. When they go out a thick fur protects them from the cold. They are warm inside and outside the house. Would that we in England could be the same!

The summer nights in Russian Poland are very beautiful. The stars shine with especial brilliancy through the calm, clear air, and often we used to ride for miles over the country by their light alone. We rarely met any one in these nocturnal journeyings, even when passing through the villages, where the only signs of life were the dogs that used to bark savagely at our approach and snap at our horses' heels.

Limits of space forbid me to dwell on the many minor incidents that occurred during my stay. I must conclude this article by a description of a characteristic entertainment in a country-house at which I had the pleasure of assisting shortly before bidding my kind friends adieu.

It was Madame V——'s *imieniny* or 'name's day,' and our party had been asked to a dance at Z—— to celebrate the event. The night was very wet when we started for a drive of twelve miles in a closed carriage that leaked in a peculiar, and possibly Polish, way. Every now and then about a pint of water would suddenly come into the carriage from the top of one of the windows. The cause of this was not easy to understand. Our business was to dodge it, and this mainly occupied our attention during the drive. Z—— was a fine house with large rooms, all on the ground floor, connected by doors. Our host received us in the hall, which was filled with men. Great trays with steaming tea and thin slices of lemon were being handed round. An aromatic cloud from the *papierosses* filled the air. A babel of tongues talking French resounded on all sides. We greeted several old friends, and were introduced to some strangers.

Facing the hall door was the big drawing-room that was the ballroom for the occasion. On the right of the hall was another room, and in it a brass band of sixteen performers in blue-and-red uniforms. It was explained to me that six months ago the performers were simple, untaught peasants, who had been taken in hand by a clever amateur musician, with a result extremely creditable. I joined the company of smokers hanging about the ballroom door. Yonder the ladies were exchanging confidences and testing mysterious adjuncts to their dresses. The steaming tea-trays were still being carried round, and did not pass in vain. Suddenly, as I raised my cup to my lips, I heard a terrific crash from the music-room. I almost dropped my cup! Strange to say, nobody else seemed astonished. A moment after I knew it was the peasant band commencing the first valse! Never in my life had I heard such a band. They blew at their instruments as if there was a prize for the one that made the greatest noise. The very house shook with the vibrations, and through the whole company a sort of nervous impulse seemed to have spread and set them all madly in motion. Even I fell under the spell, and, singling out a pretty partner, joined in the fray. Over the polished parquet floor we sped as the band boomed with increasing vigour. I could not help contrasting our quiet English ballrooms and their weary-looking dancers with that moving, energetic crowd of people who apparently had been born to gyrate so gracefully. But more was to come later on, when supper had been partaken of and the national dance was in full swing. Not all danced, however. In a room leading off the ballroom there were card-tables, which were freely patronised by the devotees of poker and écarté. In Poland one does not engage a partner for the whole dance; one simply takes a turn round and then brings the lady back to her seat. Such a practice as 'sitting on the stairs' is entirely unknown there. The idea would be thought highly improper.

At last supper was announced. The ballroom emptied rapidly, and along the sides of the two long tables we searched for our places, which were marked by cards bearing our names. Near me sat a genial priest, who before supper was over had invited me to dinner to 'taste his wines.'

The supper was capital. The *cuisine polonaise* achieved a veritable triumph on this occasion. French wines of excellent quality circulated round the table, and were followed by rare old Hungarian, an especial favourite with Poles. All through supper the brazen band played with undiminished vigour. The company got very merry, and conversation became almost a roar. Healths were drunk, glasses clinked, wine was spilt, and general merriment and good humour prevailed, when at length a move was made to the ballroom, as the band struck up the opening notes of the 'Mazur,' the national dance of Poland. A young *viveur* of Warsaw led the dance. He rushed up to me and insisted on my joining. I protested in vain on the score of complete ignorance, but he would hear of no excuse; so, with a reckless disregard of consequences, I dashed down the room with an unfortunate lady, who raced after me in fear and trembling. I will not attempt to describe the figures of this wonderful dance. It is a sort of wild cotillion, and the characteristic feature about it is the way you jump slightly into the air as you dance along sideways, at the same time bringing one heel against the other with a loud *click*. This is done in rapid succession, and the effect is peculiar. In my endeavour to perform this feat I cut my ankle with the sharp edge of my shoe-heel, and have a scar there still. Only a Pole can dance the 'Mazur' properly. It is in the blood. A Pole dancing the 'Mazur' is a dangerous man if crossed. His patriotism seems to scintillate from the tips of his fingers. If he could only close his fist then in true boxing style he could fell an ox or—a Russian! With astonishing wisdom, the Government has left him the 'Mazur.' It is a harmless outlet of patriotism, and keeps him from more serious courses.

During the 'Mazur' a mysterious potation was dispensed in the hall. They called it *cherie koblère!* I fancied I recognised the name. It was a terrible concoction, however—a mixture of sherry, brandy, and spices. It had a very exhilarating effect on the dancers, and, I half-suspect, found its way down the throats of the peasant band, for the music got more uproarious as the night advanced. No one seemed to tire that evening; all danced as if their very lives depended on it. Fat people bounced about like india-rubber balls, thin people bent and swayed like twigs, mothers of

families skipped like young schoolgirls, and even the graybeards seemed determined to show they could yet compete with the young ones in treading 'the light fantastic.' There was an audience to this bright entertainment. At the end of the ballroom the French windows were open, and a dense body of peasants in their picturesque coloured dresses stood on the veranda and looked on. They seemed to love watching the *panstwo*, and many a whispered exclamation passed from one to the other as the 'Mazur' proceeded.

It was daybreak before the party broke up, and with many hand-shakings we took leave of our hospitable host and hostess, and drove back as the peasants were beginning their work in the fields. The night of merriment was over, and once more we returned to the quiet of the country life.

A few days after I bade my kind friends good-bye. They stood on the platform waving their adieus as the train moved away to the frontier. A basket rested on the seat beside me, a parting gift from Madame D——. It contained fruit, Polish partridges, and some home-made *vodka*. In a spirit of enthusiasm I uncorked the latter, and, filling a pocket-glass, drank to Poland and its hospitable people.

CHINESE DOCTORS IN AMERICA.

AMONG the most successful physicians in the United States, judging by the number of patients they treat, are the Chinese. Their practice is by no means confined to those of their own race. Strange as it may seem, some of them in the cities of California have a larger number of patients among the Americans than the doctors of other nationalities. The Chinese doctors may be divided into two classes, although the American law does not recognise either class as legitimate physicians. One class treats persons of its own race almost entirely, and does not employ medicine so much as it does amulets, and what is called in the United States magic, to drive away the evil spirits supposed to create disease. Some of these quacks are to be found in nearly all the western cities; but the higher-grade Chinese do not patronise them. The other class of doctors assert that they give treatment which their ancestors employed centuries before Christ, and that the gift of healing has been handed down to them through the ages. The majority are descendants of physicians who lived either in the United States or China, and in their offices can be seen ancient books in the native tongue, as well as gorgeously decorated diplomas which they cherish as heirlooms. Such cities as San Francisco, Sacramento, Los Angeles, and other large communities have physicians some of whom receive from one hundred to three hundred American patients daily, for very few of them make visits unless the illness is very severe, when they charge an unusually large fee to repay them for the time lost in leaving the office. The most noted Chinese doctor, perhaps, on the Pacific coast died several years ago. He resided in Los Angeles, and actually received fees amounting to between twelve thousand pounds and fifteen thousand pounds yearly. Frequently in one day he would examine and prescribe for two hundred persons, and his office hours were positively from early in the morning until midnight. The nephew of Le Po Tai, the physician referred to, took up his uncle's practice in Los Angeles, and, it is admitted, has more cases than any of the American doctors in the city, although they number about one hundred and fifty.

The method of treating sick persons adopted by Chinese doctors in some cities is similar to that of the other physicians of the United States and those of Great Britain. They depend much, however, upon the examination of the pulse. Their sense of touch is so wonderfully developed that it is claimed they can determine the condition of the heart as well as some of the other organs merely by the feebleness or strength of the beats; but they say there are no less than twelve different movements of the arteries in the human body, all of which can be detected by feeling the fingers, wrist, and arm. When a patient calls upon him for examination, the doctor first presses the arm, wrist, and fingers, touching nearly every part. Sometimes ten or fifteen minutes are occupied with this examination. Then he may ask whether the patient is married or single, and also his age; but this is about the limit of the examination. Apparently he can tell the nature of the disease without questioning further; and if the caller wishes a prescription, he writes one in the ordinary Chinese characters on a generous-sized square of paper. Ringing a bell, he hands the prescription to the Chinese attendant who enters, for each physician has his own shop, filled with the ingredients which he uses in treatment. If he has a large practice he may employ a native chemist, who makes up the prescription. One of the curious features of Chinese medical treatment is the way in which the physicians administer their remedies. Nearly all the offices of the principal doctors have what may be called a tea-room attachment. This is a spacious apartment, well lighted, frequently ornamented with Oriental pottery and pictures, and containing small tables, each with two or three chairs. If the invalid does not wish to take his medicine at home he is ushered into this room, and while seated at one of the tables, drinks his prescription as he would a cup of tea or a glass of wine. With but few exceptions the medicine is in liquid form, and served hot in dainty Chinese bowls, for most of it is composed of a decoction of herbs.

Each table contains a bowl of raisins, and when the attendant brings in the medicine he also brings in a glass of tepid water. If the drink is bitter, as it usually is, the patient can eat some of the raisins to remove the taste, while with the water he rinses his mouth and throat. Then he is ready to go home, returning the next day for another examination and another dose. Chinese doctors do not believe in giving medicine more than once or twice a day; and the memorandum which the druggist so frequently puts down on the English or American prescription, 'A teaspoonful every two hours,' is conspicuous by its absence.

Any one who chances to visit the chemist's department of the Chinese physician would be surprised at the number of different medicines it contains, labelled in the characters of the Celestial Kingdom. While most of the medicines consist of herbs, there are also dried flowers, curious-looking nuts of various kinds, gums from trees and bushes, as well as scores of different barks and roots. As a matter of fact, the Chinese employ over three thousand different substances of this sort, in addition to a curious-looking powder which is made from the horn of an Asiatic deer. All the medicine comes from Asia, being carefully treated and packed in boxes before it is sent to the United States. It includes the finest ginseng, which is obtained in Korea, and cinnamon of such high grade that a single ounce is worth forty shillings. The horn-powder is one of the most valuable of all. It is used largely as an antidote for opium and morphine eating; but the physicians also sell a prescription which, it is maintained, will cure drunkenness and the taste for alcoholic liquors. This is perhaps the most expensive medicine prescribed, for a single dose costs about six pounds. Occasionally the prescription is made up in the form of pills and powders; but nearly all the medicine is taken by the patient steaming hot, as he would drink a bowl of tea.

The Chinese doctor is very strict in regard to what his patient eats or drinks. He is careful to tell him just what kind of food is good for him, and if he disobeys his instructions the doctor refuses to treat him any longer. These medical men are apparently very familiar with the different American foods. In nearly all cases they refuse to allow a patient to eat meat of any kind which is fried or roasted, although physicians of other nationalities consider roasted meat healthful. They also prohibit the drinking of cold water, or liquids of any kind, and seldom allow an invalid to use tobacco. Most of the American fruits are also barred, so that the bill of fare of a person who is under treatment is very limited.

There is a good deal of pomp and ceremony in the office of one of these doctors. Invariably they have attendants of their own nationality, and every one of the household, from the doctor down to the chemist, wears the robes of his native country. Some of the physicians are as gorgeously attired as the representatives China sends to other countries as her ambassadors, their garments being sometimes made of silk so rare and costly that a complete robe would be worth over a hundred pounds in English money.

Nearly all have their offices in their homes, which are among the most palatial in the Pacific coast cities; but larger practitioners have elegantly furnished reception-rooms, one of which will hold thirty or forty persons without crowding. Each patient is received in the order in which he enters, no matter whether rich or poor; and it may be added that if a person is unable to pay the fee of the doctor he is usually treated gratis; but compared with the charges of the American physicians, the Chinese doctors are very moderate in their demands. They seldom receive over three pounds weekly, although the patient is expected to call every day until he is cured. Another peculiarity of their practice is that they generally predict when a cure will be effected, no matter what may be the nature of the disease, and seldom treat a person longer than three months unless he is afflicted with some special ailment which requires more time. The number of persons who are cured by the methods of the Orient is, of course, questioned by other practitioners. The latter claim that the higher grade of physicians are but little better than the so-called quacks, and that much of the medicine they give does not contain any healing virtue. On the other hand, among their patients they number many prominent people, who assert that they have been cured where other doctors have failed; and it is noticeable that more and more Americans of the better classes are yearly patronising the Chinese doctors. The success of the one in Los Angeles is not exceptional, for there are fully a score in San Francisco whose annual incomes range from five thousand pounds to ten thousand pounds from their treatment of Americans.

AT KARUIZAWA, JAPAN.

I THOUGHT the sun had disappeared,
The glade my window looks upon
Had grown so dark. I surely feared
The sunshine for to-day was gone.

But when I chanced to look again—
Expecting darkness—to the trees,
A swift joy passed from eye to brain,
To see what change had come to these.

Once more green leaves were flecked with gold;
The evening sun had turned, to grace
The glade with that heart-warming glow
Which smiles wear on a serious face.

That suns of joy and mental light
Have set, for me, I've often feared;
But, when I've least expected it,
They always yet have reappeared.

I hear a cheering promise read,
That until life itself is past
Gladness to sorrow shall succeed,
And light to darkness, to the last.

DO WE SUFFER FROM OVERWORK?

By J. CATER, M.D.

THE expression 'overwork' is by no means adequate even for the purpose for which it was coined, for it fails to convey any definite meaning. A person may have worked for too long a period, or may have strained his powers of endurance, or he may have entered upon a task beyond his capabilities, or he may possibly have worked in entire disregard of the laws of physiology or hygiene. Whatever may be the facts of the case, the unfortunate result is usually described as 'overwork.'

This being so, let us consider a few facts with a view to determining whether it is excess of work, or merely a faulty method, that is really to blame for a person's physical or mental collapse.

Doubtless we all experience sensations of fatigue at one time or another; and this experience is nature's kindly warning that we need rest. Nature herself may therefore be compared to a sentinel who sounds an alarm when danger is at hand. The warning thus sounded, in the form of a sensation of fatigue, signifies nothing beyond this, and should not be regarded as indicating exhaustion of vital power. In other words, consciousness of fatigue by no means implies that our stock of energy is played out, or that our powers of endurance have been unduly taxed. Such is seldom, if ever, the case; and to encourage such a thought means simply a more acute state of depression. The fact is, that despite the sense of fatigue, we still have considerable reserve force left, and it is against drawing unnecessarily upon that reserve force that nature gives timely warning. For it is only when we have exhausted our natural energy, and begin to draw unnaturally upon our force in reserve, that serious devitalisation ensues.

Suppose we ignore the feeling of weariness or fatigue, and—thus disregarding the warning of nature—proceed with our work by sheer effort of will. We then enter upon quite a different physical condition, because under such circumstances a demand is made upon our reserve forces, and matters soon reach a very serious state. Once the reserve force is brought into action a peculiar debilitating effect is felt; and if the new source of energy is drawn upon to the limit, the time quickly arrives when our total strength really is used up. And here comes the point to be emphasised. Assuming that we have completely exhausted our energy, the reserve as well as the natural, we are then confronted by genuine physical disaster, and it is too late even to talk of taking rest. Nature's powers of recuperation would, in such a case, have become so weakened that the work of repair cannot be accomplished.

The physical condition might then be compared to that of a person who had lived upon his capital instead of keeping his expenditure within the limits of his income. In other words, the complete exhaustion of resources constitutes real *breakdown*, and this alone should be described as *overwork*.

The wearied worker should endeavour to ascertain to what extent his 'tired feeling' is real; for if the feeling is that of momentary lassitude, or even mere laziness, no warning of need for rest has been given. A practical method of determining the measure of fatigue is to trace the tired feeling to its source—that is, discover whether it is situated in that part of the system which has recently been exerted. Thus, if work has been done with the brain, and the tired feeling comes in the legs, which have been resting, it cannot be regarded as indicating any approach to overwork.

And *vice versâ*, suppose a person has just returned from a walk, and, experiencing a sensation of fatigue, stretches himself on a couch and laments a loss of physical strength. His weariness may have nothing whatever to do with his muscular machinery. What he imagines to be bodily fatigue may be purely the result of a mental condition arising from lack of pleasant companionship, or from a lazy or aimless dawdle, or from a sense of having been bored. What this person needs is not rest in the sense of bodily inactivity, but another

[*All Rights Reserved.*]

and brisker walk, or else some active mental exertion.

One frequently hears persons assert that they are 'too tired to move,' yet these supposed weary ones spring into new life on the arrival of some welcome visitor or the announcement of pleasing news. What they mistook for bodily exhaustion was merely a mental weariness, originating probably in the lack of some pleasant occupation, certainly not in a failure of their muscular power.

These illustrations will suffice to denote the ease with which we misinterpret our sensations, and emphasise also the importance of discovering whether fatigue of one part is being mistaken for that of some other part. Thus we may learn that what we have been calling *overwork* is nothing more nor less than worry or boredom, the condition requiring, therefore, change of scene and occupation rather than absolute rest. And it may be added that for most normal individuals change *is* rest.

Another important point lies in the fact that a condition of weariness, in the majority of cases, would be more accurately described by the term *over-effort* rather than overwork. The fatigue in such instances is due to unnecessary strain, and the ensuing symptoms are readily mistaken for those of overwork. Strenuous effort is far more exhausting than continued steady toil. It is easy to see that this is due to a lack of proportion between the amount of effort exerted by the toiler and the amount of effort demanded by his task. Here the worker himself is at fault. His mode of working is characterised by pressure, hurry, or by lack of method; and the effort he puts forth in consequence involves *straining* his powers beyond the point required. Take a skilled mechanic at his bench and compare him with an amateur attempting a similar feat. The one works with perfect ease, and is little fatigued at the close of his day; the other is worn by anxiety, and from lack of skill puts forth a triple amount of energy with a less satisfactory result. In cases where anxiety is unduly present, the trouble may generally be traced to faulty methods of working, and is seldom, if ever, due to the magnitude of the work.

The human machine was built to work, and so long as there is no painful consciousness of straining, or so long as we avert using force to drive the engine, so long, indeed, as we put the machine only to its legitimate use, we need have no apprehension for its continued welfare.

From the few suggestions advanced above it may be adduced that the remedy for most cases of so-called overwork is not an entire cessation of labour, but an improvement of the methods of working. Few cases of supposed breakdown are really due to excessive exertion, whether mental or physical; the cause is more frequently to be found in the mode of working or the lack of regularity in the periods of repose. It is not, moreover, so much a reduction in the amount of one's work that is required as an economising of effort in performing the task. In many instances of faulty method, if the task itself were curtailed the effort put forth would probably be as great as before. The cry for less work, in short, has no basis in fact. What is wanted, rather, is reform in the method of working, and *that* in individual cases.

If, then, it be more a question of improved method than of lessened labour, what should be done? In the first place, our business should be made one of our daily pleasures, instead of being regarded as irksome toil. Our work should become part of our ideal existence, instead of a duty discharged with the reluctance of a prisoner on the treadmill. Next, we should lose sight of the task as a whole, and be content with conscientiously doing a day's work in a day. Many an ambitious toiler comes to grief through making prodigious efforts to finish a task off-hand in less than normal time, and this inevitably results in *straining*, and hence abusing, the human machine. Notice how the traveller's sense of fatigue is modified while he is yet a long way from his goal. At the start he felt as though he never would reach his destination, so oppressive was his consciousness of the distance to be traversed. But as soon as he begins to note each field by the way, each milestone he passes, as marking off so much of his journey, he is conscious of making progress, and his mental strain and impatience are proportionately reduced.

Our work, whatever its nature, must be habitual, orderly, and without needless effort. Every move should count for just that much accomplished toward the desired end. It is forcing our powers after they have become jaded that is responsible for the inordinate use of our strength. Allow no consideration to excite the mind to *violent* effort; for only unnatural and exhaustive effort results in breakdown. It is the 'stayer' in work, as well as in sport, who eventually gathers the reward of 'best man.'

GIANT CIRCUMSTANCE.

CHAPTER III.—HOW THE NEWS CAME HOME.

'AND you mean to tell me, my dear,' said General Carrick as he gently stirred his tea and looked searchingly at Una Devon, 'that your father is showing no signs of mental decay yet? As—tonishing!'

'He seems just as usual, as far as I can see, General,' said Una, looking back at him guardedly. There were times when she could not be quite certain whether the General was not taking his fun off her.

'Ah! Your filial duty would naturally make you wish to hide it as long as possible. Looks a bit worried now and then, doesn't he, now?'

'Well, perhaps he does. But so do a good many other people nowadays.'

'Ah!' said the General, with a satisfied nod. 'It's beginning. No man can take up the War Office without his brain beginning to soften. I've watched 'em for thirty years, and it's invariably the case. They go in as large as life and full of good intentions, and we all know what *that* leads to. But the moment they pass the doorway the evil spirit of the place begins to wind himself slowly round and round them, till all their big, new ideas are throttled. They struggle against it—some of them—oh yes, I'll grant you that. They struggle a bit, like the fellow with the snakes we used to read about at school; but it's always too much for them. Then their brains give way, and they go all to pieces, and die of sheer congestion. They can't help it, bless you! It's in the atmosphere.'

'It sounds horrible,' said Una, staring at him with wide blue eyes. 'I hope father will get out of it before he gets as bad as that.'

The General shook his head dismally. 'Just look how they're muddling along in the Soudan now. It's always the same kind of thing. They never learn. Look at the Crimea'——

'Oh, well, they muddle through somehow, and we generally come out all right in the end,' said Una, satisfied in her own mind that the General was only having a trot on his hobby.

'We muddle through because we've got to get through at all odds. We can't afford to do anything else. But as to coming through all right! No, my dear,' with an angry shake of the head. 'We squander through somehow by sheer weight of men and money. But the amount of waste in both is something terrible. When did you hear from Geoff last?'

'Last week. Nell had a letter the same day.'

'Ah, I thought you might have heard since. I'm hoping for news of the advance any day, and then to see the end of it. It's a long and tiresome business.'

Una had dropped in for a cup of afternoon tea with Ellen Challis. Ellen happened to be out on one of her many ministries, and General Carrick was gallantly doing his best to entertain his guest till she returned.

He had an immense admiration for the girl his boy was going to marry. He had an old soldier's eye for physical beauty, and Una satisfied it.

'Splendid pair they'll make,' he was saying to himself, as he chatted with her and thought of Geoff. 'And the children should be beauties.'

As to character, in its finer, deeper strains, he considered Geoff the more highly endowed; but that, perhaps, was only natural, since he knew him so much the better. And Una, after all, had plenty of common-sense, which is not always the concomitant of extreme beauty. He thought they would get on well together, and was anxious to see them married so that he might enjoy their children before he sent in his papers for good and all.

'She can't be long,' he said, for the third or fourth time, as Una made a preliminary rustle which he recognised as symptomatic of an intention to depart. 'It must be old soldiers, I think. Mothers' meetings and crèche are standard fixtures, as you might say, and fairly reliable as to their hours; but old soldiers are undeterminate and sometimes encroach. But she certainly can't be long now.'

'I can't imagine how she finds time for it all, and inclination,' said Una. 'It's perhaps a good thing we're not all built in the same way.'

'Would be a bit awkward, wouldn't it?' said the General sympathetically. 'Some lines would get deucedly overcrowded, and some would go empty.'

'I've tried, but I can't work up a bit of enthusiasm for old soldiers—common soldiers, I mean'—as the old gentleman began to laugh—'the kind that smoke very bad tobacco, you know, and use snuff, and have watery eyes and noses. And as for mothers and babies—that kind of mothers and babies, of course, I mean—I simply—well, I simply do not like them. I tried my very best to persuade myself into it. But they were too much for me, and I had to give them up.'

'I don't know that I would care much for that kind of mothers and babies myself,' said the General. 'But the men—that's different. There are some very fine fellows among them, and some of them have been infernally badly treated—I beg your pardon, my dear. What I was saying was that the treatment—the neglect—some of them have met with at the hands of their grateful country has been simply disgraceful. Why'—rapping his right fist into his left palm—'of course. It's old Brading she'll have gone to see;' and in answer to Una's raised brows and look of mystification

—'my orderly all through the Crimean muddle, and as fine a fellow as ever stepped. You've heard me speak of him. He's been ailing—failing, in fact—for some time past, and Nell's been feeling a bit anxious about him. He has never wanted, anyhow; which is pleasant to remember'——

And just then the door opened and Ellen Challis came quickly in, all aglow with the crisp air of the streets.

There was a look of Geoff about her, but femininely toned and softened and sweetened, and her face was English roses instead of sun-cracked African khaki. But there was the same high look of unwavering truth in the frank brown eyes, and the same quiet appreciation of the humours of life dwelt about the corners of her mouth, only they resolved themselves into dimples instead of creases. Her dress looked almost severely plain alongside Miss Devon's; but it fitted her with military precision and suited her exactly. Her voice, too, as she greeted Una with a kiss, was exactly expressive of her nature—round, mellow, deliberate, quietly strong.

'How are you, dear? I know you've been waiting by the look of reproachful resignation with which Baskett touched up his horses for another walk as soon as he saw me. Has the General given you your tea all right?'

'I've given him his,' said Una. 'It has taxed me somewhat to keep up with his demands for sugar. But I think I've succeeded fairly well. I don't know what his doctor will say.'

'He is restricted to one single lump of ordinary size,' said Nell severely.

'I think he had four in the last cup;' and the General laughed like a seventy-year-old schoolboy caught in the act.

'Was it Brading you were visiting, my dear? And how is he?' he gurgled by way of diversion.

'He is very low. I'm afraid he won't last long, uncle. He sent you his respects, and said he would like to see you again soon. I think I'd go round to-night, if I were you.'

'I'll go round now,' said the General, jumping up. 'He's a good fellow is Brading, one of the best I ever met. I've just got two letters to write, and then I'll run over there. If I don't see you again, my dear;' and he took temporary leave of Una.

'If you should get any news of Geoff,' he said, putting his head inside the door again, 'you might send us word. Things may be happening any day now, you know;' and he went away to his den.

'Well, dear, what news have you?' asked Una as Nell settled comfortably to her tea. 'What is the latest about Exmoor?'

Ellen shook her head. 'Poor fellow! It is terribly sad. He has given up all hopes of himself, and when a man loses hope he has not much left to fall back on.'

'And what do the doctors say?'

'They say he may linger on for a time, but I fear there really is no hope for him. It is very sad.'

'The situation has its compensations, however—for you and Charles Doone, I mean,' said Una in a matter-of-fact way. 'A coronet is never to be despised, my dear, even if you don't hanker for it. And I'm bound to say I think Lord Charles will grace it better than his brother ever did or would have done. He will give up the navy, I suppose?'

Ellen's smooth brow had pinched momentarily at her speech.

'It may become necessary, and we are both very sorry for it. He is so completely happy in his work. But it would be impossible for him to fill both positions properly, you see, and the undesirable one cannot be laid aside.'

'As a philanthropic countess you will have an immense vogue, Nell, and no one could possibly fill it better.'

'We would both have preferred the quieter parts, and I think we should have been happier in them. Charlie hates fripperies as much as I do.'

'You'll get used to them, my dear; so used to them that you'd come to miss them horribly if they vanished.'

'Yes, I suppose one can get used to anything if one has to.'

Then the door opened suddenly, and the footman announced, 'Mr Devon;' and the Hon. Ainslie came quickly in with a face that was even more sober than had become habitual with him of late.

He lifted his eyes at sight of the two girls. His mind had been too much occupied to notice his own carriage strolling down the street as he sprang out of his hansom.

'You here, Una!' to his daughter; and to Ellen, 'How are you, my dear Miss Challis? It was the General I wanted to see. The man told me he was here.'

He was evidently disturbed about something. The minds of both girls jumped instantly to battles and sudden deaths in the Soudan.

'He left us a minute or two ago to write a letter, Mr Devon. I will send him word that you are here.'

'I think I'll go to him, my dear. He'll be in his own room, I suppose. Don't ring. I know my way;' and he turned, obviously anxious to escape.

'You have got some news, father. What is it?' asked Una.

'In a minute or two, my dear. I must see the General first;' and he hurried out, and the girls sat looking at one another with a scared glint in their eyes. For news that came in this fashion could hardly be good news.

They tried to resume conversation on commonplace lines; but it was no good, and they sat nervously waiting developments.

Mr Devon hurried along the passage till he came to the door of the General's den, and halted at it as if afraid to enter. Then he tapped gently, and opened the door.

'Hello, Devon! This *is* a treat. Taking a holiday from red-tape? Good heavens, man, what's wrong? Geoff killed?'

'Geoff is all right, Carrick. Sit down and I'll tell you. Yes, thanks! I'll take some too,' as the General, scenting trouble, reached his hand to the spirit-stand as a precautionary measure and first line of defence. One feels sudden shocks at seventy as one does not at thirty-five.

'Now, my boy, fire away! The old man can stand it if the boy's alive. What is it?' as Devon still hesitated, loath to be the bearer of news which would hit his old friend harder, perhaps, even than the news of the boy's death would have done.

'Prince George is dead.'

'Good Lord! That's a bad beginning. The last of the direct line, too.'

'And—and—it's some ghastly mistake, of course—but they seem to be trying to hold Geoff responsible for it.'

'Geoff responsible? How on earth?'—and the old warrior glared at him as if he had been struck in the face.

'Here is a copy of the telegram. It will be all about presently, but I wanted to prepare you. I'm convinced there is some stupid blunder somewhere. Geoff is above suspicion, of course. Here it is;' and he spread it out on the table.

'Read it,' said the General, fumbling mistily for his glasses. 'I can't see.'

'It's from Burleson, advance headquarters camp, beyond Temsat Wells.—"With grievous regret report death Prince George Eisenach, out hunting with Lieutenant Challis and escort. Party surprised by Arabs. Prince and two privates killed. Official inquiry demanded by Lieutenant Challis, under arrest pending same."'

General Carrick helped himself to some more whisky, and held up the bottle and poured it out very slowly to show that his nerves were under control again.

'That is, of course, the usual and necessary course,' he said quietly. 'Infernally unpleasant for all concerned, but essential and according to regulation.'

'Of course, of course,' said Devon quickly. 'That's what I say. It sounds nasty, but it doesn't mean much.'

'It doesn't mean much unless they are trying to make Geoff scapegoat for some bigger man's blunder,' said the General thoughtfully; 'and that's what they generally do try to do, Devon, and you know it as well as I. I shall look to you to see that the boy has justice—full justice. I ask no more, but that he must and shall have.'

'Of course. We will see to that. Geoff's courage is beyond question.'

'I've never quite understood on what terms the Prince was out there,' said the General, slowly following out his own train of thought. 'Was he officially attached? What rank had he?'

'He held the rank of captain, of course, as he did at home, and he was attached unofficially to Burleson's staff. He went out as the result of much insistence on his own part, to see what he could, and Burleson had strict orders to keep him out of mischief. He was a hot-headed young fellow, and I feared it would be no easy job.'

'Then, of course,' said the General, still thinking out his own thoughts, 'he would be in command of the party.'

'Yes,' nodded Devon, arriving at the same point, and then going a step further, 'unless, of course, he was directly placed in Geoff's care. But it is no good speculating on it, old friend. We shall hear shortly what the official inquiry makes of it. We are probably tormenting ourselves quite uselessly. But I did not want you to hear it first in the papers.'

'I am obliged to you, Devon. It was kind of you. By the way, your girl was here a few minutes ago. Did you see her?'

'Your man said you were in the drawing-room, and showed me in there. But I got out as quickly as I could.'

'Then they'll be worrying to death over the sight of your face. I think we'd better tell them what's happened, and explain just what it means. Perhaps in letting this go out to the press'—as he handed him back the telegram—'you could add an official word or two to the effect that—in fact, just what we have been discussing.'

'I have already done so. Geoff is a good deal to me, you must remember, as well as to yourself.'

'Ay, ay! Quite so! Well, let us go and break it to the girls.'

The girls looked up at them out of a nervous silence as they came in. Fearing they knew not what, they had hardly spoken a word since Mr Devon left them. The winter roses had left Ellen's cheeks, and Una's face was paler even than usual, and looked a trifle hard in its strenuous setting for ill news.

'I trust you will pardon my running away so hastily just now, my dear Miss Challis. I wanted to see the General at once,' said Mr Devon.

'Bad news, Mr Devon?' asked Ellen quietly.

'Well, it might have struck you very unpleasantly if you had met it unexpectedly in the papers. That is why I ran over with it first so that you might understand. Prince George of Saxe-Hohenburg-Eisenach has unfortunately been killed out there. And the worst of it is—as far as we are concerned—that he had Geoff and an escort with him. Some of the escort were killed also. Geoff and the rest escaped.'

The four anxious eyes fixed on his showed no signs of understanding.

'And so,' broke in the General, 'in accordance with custom, there has to be an official inquiry, and meanwhile they've put Geoff and the escort under arrest.'

'Under arrest?' gasped both girls at once. 'Oh!'

'It sounds nasty,' continued the General hastily, 'but it is a purely formal matter, just to determine

responsibility and all that kind of thing. I've been under arrest dozens of times'—which was somewhat of an exaggeration, though well-intentioned—'and was never a bit the worse for it. So, if you hear it referred to, as you will, you can just keep quiet faces and not feel in any way upset about the matter. —You'll hear the result of the inquiry in a day or two?' to Mr Devon.

'Undoubtedly. I will let you know at once. To-morrow or next day, I should think. It ought not to take very long.—Now, my dear,' to Una, 'if you are going home you can take me with you.—Don't worry about the matter, my dear Miss Challis. You'll see it will come out all right.'

Ellen kissed Una's pale, downcast face, and the General shook her cold hand in a paternally comforting fashion; but she said no word, and quietly followed her father.

The drawing-room door opened in their faces and Charles Doone came swinging in, in his usual breezy way, as though the whole earth belonged to him and none could say him nay.

There was a shadow on his bright face, but he cast it behind him at sight of them all.

'Ah, Mr Devon,' with a quick, inquiring look at that gentleman, 'and Miss Una?' as he shook hands with her.—'General, you grow younger every day. I vow you do. I must worm the secret out of you.' —And to Ellen, 'Well, Nell, how did you find the old fellow?'

But his wide-awake eyes caught in their faces the shadow that had been on his own a moment before, and he looked inquiringly round.

'We've just been hearing of this affair of Geoff's, Charlie,' said the General stoutly. 'What do you make of it?'

'Oh, just the usual *post-mortem* business. It's all a form, you know. They sat on me just the same when the *Rattlesnake* went on the Manacles, though it was her engines that broke down and the gale that blew her ashore. It didn't hurt in the least, though I'm bound to say I felt a bit Old Baileyish till they turned me out without a stain on my character and only one shirt to my back. Geoff'll come out all right. I'm sorry it was Eisenach. He was a nice boy, and deserved better luck.'

'Just what we've been saying,' said the General cheerily. 'These girls, I believe, think Geoff is on the high-road to the gallows because he's under nominal arrest.'

'There's only one thing, Mr Devon,' said Doone earnestly. 'Eisenach is a big figure to be wiped out like this. There may be some hard talk, and we all know what army-men are. You're a civilian yourself, so I may speak plainly. They're as touchy as the—as Lucifer, and I never knew any army-man yet who would accept responsibility for disaster if he could find any other shoulders to chuck it on to.'

'Right!' said the General, with a chuckle.

'Now, Geoff, if I know anything of him, will not open his lips in his own defence. If they try to shovel all the blame on to him, he'll just bow and stiffen the corners of his lips and never say a word. He ought by rights to have been in the navy. We breed men there, and we give every man fair-play.'

'I am alive to the possibility, Lord Charles,' said Mr Devon, with a touch of frost. 'We're not quite as bad as you make us out.'

'Oh yes, you are,' from the delighted General.

'But,' continued Mr Devon, addressing Doone and turning his back on the General, 'you are naturally prejudiced in favour of your own arm; which is quite right.—Now, Una dear, we really must get on;' and he turned to go, and Una followed silently.

'See that he gets fair-play, that's all,' Doone called after him.

It was perhaps inevitable that, as the carriage rolled softly homewards, Una Devon should contrast her own position with that of Ellen Challis.

In spite of the comforting words of the men, she felt as if she had received a blow and a smirch. Geoffrey Challis under arrest! Was it so common a thing as they had tried to make her believe? Would he come out of it spotless? Or would the remembrance of it cling to his name for ever?

She was shrewd enough to see that what might have been a small matter under ordinary circumstances became a great one under such circumstances as these. The death of Prince George would make a great sensation. She shrank instinctively from any connection with it. It would be hideous. She would be condoled with to her face—and she hated that. And talked about in accents of pity—which would cover several other feelings—behind her back; and she hated that still more. She sat perfectly still and her face was perfectly unmoved, but inwardly she writhed at thought of it all.

She liked Geoff very well, well enough to have consented to marry him in preference to others of higher rank in life; though as regards money, prospectively at all events, he compared favourably with most. She had had perfect confidence in him. She had always felt that, whatever happened, Geoff would be a tower of strength. And Geoff was under arrest! She did not quite understand what for. She did not suppose he had had any hand in killing this unlucky boy. But it must mean that he was considered to blame in some way or other. Suppose, as the result of the official inquiry, the blame remained? His name would carry a stain for life.

And Ellen Challis would be Countess of Exmoor. It would make no difference to her and Doone, for Lord Charles worshipped the very ground she trod on. She and Ellen, though always good friends, had always had their little rivalries since the days when they matched dolls and toy perambulators in Kensington Gardens. Indeed, I am not at all sure that this fact had not helped to turn the scale in Geoff's favour against his many rivals. For Ellen held Geoff as the man of men, at all events until Charlie Doone came along and entered into his kingdom. And the thought that she was taking that which Ellen held so highly may have had its

weight in Una's consideration of her suitors. It gave her points in the game.

It was a silent ride. Mr Devon was busy with his own thoughts also. He knew there were grains of truth in the one-sided utterances of Lord Charles and the General, and the fact of Lieutenant Challis being his prospective son-in-law complicated matters somewhat for him.

He was a just man, and he wanted fair-play for its own sake as well as for his friends' sakes. But he saw that any active interposition on his part would be liable to misinterpretation. There would be the usual popular clamour for the fixing of responsibility and the allotment of punishment, the usual shifting of burdens, very likely the usual scapegoat sacrifice.

He wished with all his heart that he had stood firm, even against the influences that had been brought to bear upon him, and had never permitted the high-well-born one to go out to play at war. Folks who want to play with edged tools, he said to himself irascibly, ought to be prepared for all contingencies.

Una went up at once to her own room and stopped there. Mr Devon gave Lady Eugénie the news somewhat curtly, for it was already an addition to the burdens that were full heavy before; and his manner of conveying it left, perhaps, a somewhat worse impression on her ladyship's mind than there was as yet any necessity for. The result was that she immediately decided that the sooner matters came to an end between Una and Geoffrey Challis the better. Now, when Lady Eugénie made up her mind she was as difficult as a commissariat mule, and the remarkable persistence she could exhibit in case of need generally got her her own way.

She had always liked Geoffrey. She was very sorry for this trouble that had come upon him. But her first consideration was naturally for her daughter's future, and she had always thought that Una might have done better if she had so chosen.

THE MONKS OF OLD MELROSE.

By J. J. VERNON.

IN nothing perhaps is the power and genius of Sir Walter Scott better exhibited than in the influence his writings have exercised in inducing thousands of people from all parts to visit the scenes associated with many of his novels and poems. The glamour of romance which Scott has thrown around Melrose, for instance, has contributed in a greater measure towards making the Melrose of to-day a tourist resort than the scenic attractions—beautiful as they are—of the locality. The same may be said to apply to the scenes of *Rob Roy* and *The Lady of the Lake*.

We have often been amused at visitors of a sentimental turn of mind going into raptures over the lines descriptive of Melrose Abbey, and even prepared to spend a night at Melrose on the chance of viewing 'St David's ruined pile' 'by the pale moonlight;' but question them as to the constitution of the order of the monks who abode in this abbey, or the discipline to which they were compelled to submit, and the result will be that you will not elicit a satisfactory answer from more than one person in a hundred. On the contrary, the likelihood is that they will wax eloquent about the idolatrous worship of our forefathers, and talk glibly of the appalling ignorance and wickedness of the clergy. Failing this, they are sure to sneer at the monks of old as given up to extravagant living in the satisfying of the appetite for food and drink, unaware of the fact that neither in amount nor in variety of food did the monks of Melrose fare so well as the inmates of the average workhouse of the present day. Although not depicted by the poet or the novelist's art, there are other places on the Borders of natural beauty surpassing scenes even such as these, and having much more true historic interest and associations to those who will but take the trouble to read and think than even the abbeys of Melrose and Dryburgh. One of these is Old Melrose, distant only two miles from the comparatively modern and better-known Melrose.

For many ages after the departure of the Roman legions, the valley of the Tweed was a vast waste of moor, marsh, rock, and forest. The extensive woods gave shelter to the wild boar and also to formidable packs of wolves. Beaver were abundant on the banks of the Tweed and its tributaries, and its waters teemed with salmon. Countless wildfowl covered the surface of the innumerable mosses and lochs, while herds of red-deer, roebuck, wild horses, and still wilder cattle found sustenance in the more inaccessible pasture-lands. The Angles had successfully conquered the truculent tribes inhabiting all the country from the Forth to the Humber; but conquerors and conquered alike were ignorant, rude, and barbarous in the days when Oswald ruled over Northumbria. Consequent upon the disorder and misery prevailing in this district, Oswald, while a youth, had to take refuge in Scotland, where he was influenced by the monks of Iona and embraced Christianity. Returning in 635 to Northumbria, he prevailed upon several of the brethren of the monastery founded by St Columba to come and assist him in an endeavour to convert and civilise his people. The proposal having been readily agreed to, a band of monks headed by Aidan proceeded to Bamborough, and, after having surveyed the district, selected as a suitable place to found a counterpart of Iona the island of Lindisfarne. It is now known as Holy Island, and was

as uninviting a place as could be imagined. It was a small, sandy, sterile island, bleak and exposed to the storms of ocean and land, in many respects resembling Iona, the parent monastery. Here Aidan, having first erected a church and suitable monastic buildings, laboured for several years with varying success. Through the influence of Oswald an episcopal see was established, and Aidan was invested with the united offices of bishop and abbot. In one point the new foundation at Lindisfarne differed from the parent house at Iona. At the Northumbrian monastery the bishop was the head and took the place of the abbot, and did not occupy the subordinate position held by the bishops at Iona and its dependencies. One of the bishop's chief cares was the upbringing and education of the Angle youths. Selecting twelve of these with a view to forming a native church, he made them his own peculiar charge until they were fully instructed and proficient in religious knowledge. These were afterwards his fellow-labourers in converting their countrymen.

In course of time churches were erected and societies of priests and monks were settled in different parts of the country to exercise their sacred functions in instructing the people and celebrating worship. King Oswald, eagerly desirous that his people should be taught the advantages of peace, was prepared to give grants of land and otherwise to assist the monks in providing the necessary buildings. We can imagine Bishop Aidan, with his Anglian pupils, setting forth from Lindisfarne, and, following the course of the Tweed, in due time arriving at Old Melrose, and selecting it as a suitable site on which to establish the proposed monastery. Its name (*mull*, bare; *rhos*, a promontory) fairly accurately describes it. Here the Tweed, taking a remarkably winding sweep, almost surrounds the place selected, which consisted of a piece of ground of considerable altitude, a little over half a mile in length by a quarter of a mile in breadth, and containing about sixty acres. Its position afforded a capital defence both against man and wild beast. The surrounding country, being as yet undrained, maintained the river at a good depth and breadth. The opposite banks were high, abrupt, rocky, fringed to the water's edge with tangled shrubbery and overhung with woods. The agreeableness of the place, no less than its retired situation, must have recommended it strongly to Aidan and his companions. From the river-side the ground chosen gradually rises to a considerable eminence, which is surmounted by a knoll known as *Tom Naombh*, or the Holy Knowe, and still called 'the chapel knoll,' on which was erected the first church. At the base of the chapel knoll lay the *Dal Naombh*, or the Holy Field. These place-names are interesting, revealing the purposes to which the old Celtic missionaries assigned the lands. The population inhabiting the surrounding district, whatever were the numbers, was hardly within reach of any influence of civilisation; but their very depth of paganism and ignorance only stimulated the desire of these good men to benefit them. It was just the situation they desired, and they had no difficulty in procuring a grant of the land from Oswald. The monks, satisfied as to the quality of the soil, knew that with some labour it would form fruitful fields and orchards. They also knew that from the river they could obtain abundance of fish.

Such was the place in the valley of the Tweed, solitary, inaccessible, and uncultivated, to which Bishop Aidan, accompanied by Eata, Boisil, and other monks, found their way at the end of winter. Provision for the immediate shelter of the infant convent was soon made. Having erected huts for themselves under the spreading branches of the trees, they proceeded next to construct a temporary chapel, the lower floor of which the monks used as a dormitory, while the upper story was set apart for the daily services. Near at hand they built another house, '*ex vili cemate*,' of mere mud-walls, for they recognised the duty of hospitality as second only to that of divine service. They also provided common room, kitchen, brewhouse, bakehouse, &c. A fish-pond was also essential, because when the river was in flood it was not always possible to catch fish. The traces of the pond are still visible near the point of the promontory. Another object of interest is the spring or holy well, known in later days as St Mary's Well, situated on the river-bank near the Holy Wiel Pool, a well-known fishing-pool on the Tweed. A few hundred yards below the Holy Well is 'Monks' Ford,' whereby the monks effected a considerable saving in the distance when going to or from Dryburgh and the south. Several hundred yards to the north of the conventual buildings a vallum or fence was constructed, stretching right across the peninsula. The main entrance to the monastery was situated about the centre of the fence; what was the Porter's Lodge was known latterly by the name of the Red House. Wordsworth probably had in mind a scene similar to this when he wrote:

> Be this the chosen site. The virgin sod,
> Moistened from age to age by dewy eve,
> Shall disappear, and grateful earth receive
> The corner-stone from hands that build to God.

Before leaving to return to Lindisfarne, Aidan selected the site of the permanent abbey building. He also appointed Eata, one of the Angle youths trained by him, first abbot of Melrose; and Boisil, better known by the name of St Boswell, who is reputed to have excelled his brethren in sanctity and spiritual gifts, was elected to the office of prior. The sincerity of these early missionaries was unquestionable. No hardships daunted them. Here, then, in the early spring, this ardent band of missionaries was left to its own resources. They had to work hard with their own hands to render their settlements habitable and to procure their daily sustenance—a matter of great difficulty, doubtless, on many occasions. During all this time, too, they

taught and preached the faith and good works, putting the same into daily practice not only in the monastery but also in the surrounding district. To the best of their ability they ministered to the relief of the impotent and to the necessity of the poor and needy; and gradually their semi-savage neighbours realised that in the God of these Christians was to be found the true source of all this goodness and charity; for such can only flow from but one source, the love of God and the love of man in Him.

From the works of Bede, Adamnan, and others we learn that the clothing of the Columban monks consisted of an upper garment with a hood, made of coarse woollen stuff of the natural colour, and an under-tunic of finer texture, and that they wore shoes of hide. Their food was chiefly bread, milk, eggs, and fish, and occasionally flesh. The time of the monks was spent in attending their daily religious services, the cultivation of their lands and other manual labour, reading, contemplation, and prayers.

An interesting picture of the life of a monastery in the days of its pristine purity is given by Lanfranc in his Life of Anselm, written more than eight hundred years ago: 'You might see the abbot, when the office was done in the church, carrying the seed-corn on his shoulders and a rake and mattock in his hand, going forth to the field. The monks were busy with labour all day; they cleaned the land from thorns and brambles; others brought dung on their shoulders. They hoed, they sowed, no one ate his bread in idleness, and at each hour of prayer—seven times in the day—they assembled for services in the church.' Bishop Aidan, after a life exhibiting great energy, zeal, and tact, died in 651; but the life of the community which he had founded upon such a well-assured basis at Old Melrose went on as before under his successors Eata, Boisil, and St Cuthbert. Other men, fired by his example, penetrated into the wildest regions, proclaiming the Gospel tidings, and returning to the monastery as their common home for shelter and support. In this way, as these spread all over the district, the inhabitants were converted, whole families being baptised at once and recognised as Christians.

Want of space precludes any detailed account of the fortunes and misfortunes of the monks of Old Melrose, or of the more eminent men whose lives spent in the service of God and man hallowed this spot; suffice it that Nennius testifies to the monastery having been both great and renowned. Evil days came in which, the place having been burned by enemies, the monks had to seek temporary shelter elsewhere. The Danes, gaining a position in Northumbria, began to plunder the religious houses without mercy; Ripon, York, Whitby, Lindisfarne, and Old Melrose being among the first to be pillaged. The state of the country became terrible. All public ministrations of religion ceased, and Christianity itself only preserved a precarious and feeble existence. In 1073 it is on record that Old Melrose was a desolate and ruined place, inhabited by only a few monks, who two years later quitted it and took up their abode at Monkwearmouth.

Although forsaken by the monks, it long bore a great reputation, and its ruined church was the frequent resort of fervent pilgrims. Fifty years later it was a dependency of the Priory of Coldingham; and when King David founded the new monastery of Melrose in 1136, he gave the monks of Coldingham the church of Berwick in exchange for that of Old Melrose. The latter he added to the other endowments which he lavished upon the new monastery of Melrose. The last we hear of Old Melrose is its total destruction by the English in the reign of Robert I. For many centuries it was a favourite place of devout pilgrimage, and no one acquainted with its history can stroll about the well-kept grounds unmoved by the recollection of the associations connected with this hallowed spot. Within its precincts momentous events, though unrecorded, have taken place, which left an ineffaceable impress upon the character and actions of our ancestors. Many generations met here to worship the God of their fathers, and they and their fashion of faith, though long passed away, possess an enduring interest. Here,

> All things glow with life and thought
> Where'er our faithful fathers trod.
> The very place with speech is fraught,
> The air is eloquent of God.

To us it must ever be hallowed ground, for within its confines its garth is filled with the precious dust of those who spent their lives in proclaiming Christ to a barbarous people. It is in very truth consecrated, holy ground.

THE BLACK SPIDER.

CHAPTER III.—THE 'SUNDOWNER.'

'N the road, mate?'

The speaker was an ill-clad, unkempt scarecrow of a man, some forty years of age, unshaven, unwashed, with a furtive, hang-dog cast of countenance. Over his shoulder he carried a stick and small bundle, which he maintained in its position with his left hand; the other was thrust into a pocket of his ragged trousers.

'Ay!' was the gruff reply. 'How far to Garralunga?'

''Bout two miles; maybe not quite so much.'

'Glad to hear it. I've padded the hoof to-day till I'm fairly worn out. Can you direct me to a decent doss crib?'

'I slept last night at a house the far end of Garralunga main street. It's the last but one, standing in a garden, with fields at the back. There's a stable where they put you up, and you can make yourself snug with plenty of hay. The grub isn't bad, either. You might do worse. I chalked the broad-arrow on the wall leading to it; you can't miss it.'

'Thanks, mate, and good-day to you.'

The two society pariahs separated and went on their respective ways, the second speaker proceeding in a leisurely saunter towards Garralunga. Though he was a 'sundowner,' there was something in his tone of speech and natural ease of manner which gave the impression that he had been in a very different grade of society to that in which he now moved. A close observer would at once have pronounced him to be a social derelict—one of the many thousands who sink lower and lower in the scale till they end at last in hopeless vagrancy or the workhouse.

He passed through the township, noting its characteristics with the close observation of the man who is always on the lookout for anything which he may turn to his personal advantage. In time he came to the wall marked with the broad-arrow, and stopped for a moment to reconnoitre.

The small house was of the bungalow type, all the rooms being on the ground-floor. A veranda running round it shaded the inmates from the fierce glare of the Australian sun in summer, when the thermometer not infrequently reached ninety-eight or one hundred degrees in the shade. A large garden lay at the rear of the house, and a 'black-fellow' was digging up a patch of ground in it.

The outcast of society noted all this with a swift, comprehensive glance, then walked up the path and knocked at the door. Frederick Lane opened it, pen in hand. He had risen from the table to answer the knock, and was rather amazed by it, for he was in the middle of a letter which engrossed all his thoughts, and he was the only person in the house at that moment.

'Beg your pardon! But could you give a poor man a shake-down for the night and a mouthful of grub? I've walked thirty miles this blessed day, and haven't one copper to rap against another. I'm fairly done, and nearly starved as well.'

'There's a stable at the back where you can sleep; but mind you don't smoke there, or you'll most likely burn the place down; too much hay about for that sort of thing. I'll send you some bread and cheese and beer presently.'

Instead of replying with the usual curt thanks, and taking himself off to his allotted resting-place, the 'sundowner' remained where he was, staring fixedly at his benefactor. Then he uttered a long whistle of surprise, and broke into a laugh.

'Why, it's you, Lane! I was puzzled at first, but it's all right now. What on earth brings you out here; and so soon, too?'

'What do you mean?' the young man answered, with something of mingled anxiety and indignation in his tone. 'I don't know you, nor what on earth you mean by my coming out so soon. Who are you, anyhow?'

'I suppose it's the beard and whiskers and the moustache, not to mention the absence of a Portbury suit cut according to the latest jail-fashion. These things change a man a bit; but you'll remember Dick Stunden fast enough when I remind you how we worked in the same gang at those cursed Portbury quarries. Aren't you glad to see an old companion in misfortune? Let me in, Fred, and give me a drink. My mouth's baked as dry as a cinder. Then we'll have a smoke and a talk over old times.'

Frederick Lane's countenance clouded over. This was a rencontre as unpleasant as unexpected. He could not deny that the broken-down vagrant who stood before him, persistent, swaggering, compelling, had toiled in the same convict-gang at the hateful Portbury quarries, dressed in the same degrading uniform, living on the same coarse rations, and even under the very same warder's charge. But all this would hardly, in itself, have constituted a claim to which he must yield if it had not been for another unhappy fact which lay behind the rest. Some years before, Frederick Lane and Richard Stunden had been bosom companions up to a certain time, engaged in different work in the City during the day, but spending their evenings together—frequently in each other's rooms, sometimes in the pit of the theatre, boating up the Thames on Saturday afternoon, or witnessing the finish of a great cricket-match at Lord's.

Then came the crash, when Stunden's never-failing supply of money was discovered to be the result of long and cleverly concealed embezzlement, managed with a cunning which showed him to be a master of craftiness. Five years in Portbury forced upon him the stern lesson that honesty is the best policy after all. But, as ill-fortune would have it, only three months before Stunden's time was completed Lane was sent to Portbury also, on the charge which was afterwards proved to be utterly false.

One hour on Sunday afternoons, during exercise in the great yard of the prison, was the only time in the week when those convicts whose record was good were allowed to talk. During these conversations Lane always stoutly affirmed his innocence, which Stunden as resolutely refused to believe. 'Bless you! none of us ever did anything on the *cross*,' he would remark, with a grin and a wink. 'We're just poor innocent lambs in here, and it's downright persecution—that's the size of it—to shut us up here in this way.'

Stunden's five years terminated within three months of Lane's arrival in the prison, and therefore he knew nothing of the release on free pardon which his friend received. After leaving the jail he contrived to get somehow to Australia (how such men do it is a mystery, but there are many similar cases). Consequently, his surprise was great when

he recognised his brother-prisoner in the man who stood before him now.

'Well, you may come in for a while,' the young bank-clerk said, after some consideration. 'If I can help a man who was once my friend to work his way up again I'll do so. This way,' and he led the other man into his own room.

'Was once your friend,' repeated the 'sundowner' in a sarcastic tone as he carelessly threw himself into the one easy-chair which the apartment contained—'was once your friend! And why not still, Fred? What have I done which you haven't, pray? We've both been in trouble—to phrase it genteelly—both had a little difference of opinion with the law as to the extent of liberty of actions, and we both got the worst of that little unpleasantness. I don't see where your highly moral platform is, from which you can afford to look down on me. Stow all that rot, old man, and be chummy, as you used to be. I can't stand humbug. I like sincerity.'

Lane had been engaged in opening a bottle of soda-water, but he stopped for a moment now and looked steadily at his companion. There is a strange instinct in us all, something akin perhaps to that which we see in the animals, which hints at approaching danger even though the nature of the peril is not clearly perceived; and the moment Lane set eyes on the 'sundowner'—even as he opened the door to his knock—he was conscious of some trouble, some danger vaguely looming near. And the very attitude of Stunden, as he lolled ostentatiously in the easy-chair, his careless, self-possessed words and tone of voice, now thoroughly confirmed this feeling. The wanderer's whole demeanour was plainly that of a man who has suddenly and unexpectedly found a welcome haven of refuge from which he is resolved not to be easily displaced, and Lane accepted the challenge without a moment's hesitation.

'I told you again and again,' he said firmly, 'when we were in Portbury together, that I was innocent of the crime for which I had been sent there. You seem to have forgotten that.'

'Not a bit of it, old man. Of course, of course; very natural and proper. And you seem to have forgotten what I told you, that we were all in the same boat: all victims of society's stupid blunderings and prejudices.'

'You can spare your sarcasm and cheap wit,' replied Lane, with some contempt in his tone. 'I received a free pardon from the Queen. Perhaps you won't be so sceptical now.'

Stunden's face clouded. This was an unexpected check to his secret scheme. Utterly unscrupulous, sunk below all ordinary level of manhood and self-respect, he had believed he saw a good chance here for blackmailing. In those days transportation had only just been abolished at the earnest demands of Australia herself. There were hundreds of convicts in the colony: men out on liberty to a limited extent, earning their living in various ways, or, as in the case of this 'sundowner,' leading a miserable, useless life of vagrancy and shiftless, hand-to-mouth existence; and for a bank-clerk to be suddenly exposed as a former prisoner, a recent inmate of Portbury, would have meant instant dismissal from his comfortable situation and a hopeless prospect of obtaining anything similar. To avert this, Stunden had hoped that his old friend, upon whom he had come so unexpectedly, would gladly 'come down handsome,' and not with a mere sum of money paid once and for all, but with a regular—if modest—allowance which would be extremely acceptable; and now all this bright vision seemed fading away in the revelation of a free pardon, which of course proved entire innocence.

'Well, you were in luck to get that, I must admit,' Stunden said, after realising the new situation. 'Handy little documents those free pardons, but rather too scarce. By-the-bye, will you let me see it? I've never set eyes on Her Most Gracious Majesty's royal signature, and I should greatly like to inspect the handwriting of a queen. Let's have a look at Victoria's penmanship.'

Lane hesitated. He could not comply with this awkward request, and did not like being compelled to say so; but he had no anticipation of the rapidity with which Stunden would seize and turn the admission to his own purposes.

'I had an unlucky accident. I landed at Adelaide, where passengers are put ashore in a steam-launch. It takes forty minutes to come from the liner, which lies out in the roadstead, to the quay at Port Adelaide. The sea was very rough. I put a small portmanteau containing a few valuables and some papers on the seat running along the side of the launch, which was pitching badly. About half-way to shore, one big wave broke over her; half-a-dozen of us were drenched to the skin, and, what was far worse, several light articles of baggage were swept overboard like corks, my portmanteau amongst them.'

'Which contained the mythical "free pardon,"' remarked Stunden in an ominously quiet voice, but his eyes gleamed with deep satisfaction as he spoke.

'Not mythical,' retorted Lane angrily; 'the document was there, and I could easily get proof of it if I wrote to England.'

'Eight weeks for the letter to go out; some delay in ascertaining the facts; eight weeks more for the reply to reach you—say twenty weeks at the shortest—five months in all. Meantime, a word to the manager of your bank, gently hinting that he was employing a ticket-of-leave convict, would ensure your instant dismissal, I am afraid.'

'And who is going to say that word, and why?'

'In this rough world you can't blame a man for looking after his own interests. I think your situation is worth twenty pounds at least, and that you have the common-sense to recognise that fact.'

'Do you really mean that you are stooping so low as to blackmail me?'

'That is an ugly word, my dear fellow. Let us put it this way: I do you a great service in keeping your little secret, and your gratitude takes the form

of a present of twenty pounds to me. You couldn't prove your innocence under five months' time; the prejudice against employing an ex-convict in the colony is very strong, and the story would spread all over the town. I don't want to be hard upon you; but I think you must see that I hold the ace of trumps in this game, the best card in the pack.'

'You shall have my answer to-morrow,' said Lane slowly. 'Meantime you will oblige me by retiring to your bedroom—the stable—the only fitting place for such a cur as you.'

Stunden grinned.

'If it pleases you to blow off steam, do so by all means,' he said; 'hard words break no bones, and I can make allowance for your feelings. But unless that twenty pounds is forthcoming after breakfast to-morrow morning I shall raise my terms. Good-night: sweet sleep and pleasant dreams to you.'

CHAPTER IV.—NEMESIS.

LEFT to himself, Lane reflected deeply on the serious and wholly unexpected difficulty in which he now found himself. It was quite true, as Stunden had cleverly pointed out, that the revelation of his having been a convict would infallibly bring about his instant dismissal. His own protestations of innocence would be absolutely useless, and every door of employment would be shut against him in the town. Worst of all, a new Paradise which had just opened its gate to him would be closed by the flaming sword of jealous conventionalism. For Lane had recently won the love of a sweet, gentle girl, the daughter of a neighbouring farmer, and was her accepted lover. He pictured to himself with what scorn and wrath Agatha Romney's father would tell him to begone when Stunden's bomb-shell had exploded, and the thought was intolerable.

To add to all these difficulties, he knew he had only three or four pounds in the world at present, and could no more lay his hands on twenty the next morning than twenty hundred. The situation seemed hopeless.

The entrance of the 'black-fellow' with a tray interrupted his painful musings. Joey was a native Australian, an aborigine, and was a sort of general factotum to the household. He was greatly attached to Lane, who had saved him from some cruel treatment at the hands of a big white bully, in the fight with whom Lane's skill in boxing had brought him off an easy victor, and made Joey his grateful slave for life.

His quick, watchful eyes saw in a moment by his master's silence and dejected attitude that something was wrong.

'Massa Fred, you sick?'

'No, Joey; but I am worried.'

'What worried?'

'That man who is sleeping in the stable is a bad man, and wants to do me harm.'

'Ah-h-h! mine see; plenty bad that white fellow. Massa Fred, why you no' kill him?'

'No, Joey, that would not do. He wants to harm me very much, but I must not go so far as to kill him.'

'Dat stupid. When Joey have enemy, Joey kill him. Trouble done finish.'

'It won't do, Joey. He knows something about me which I do not want to be told to other people; and unless I give him a great deal of money to hold his tongue he will do me a great deal of harm; but I cannot kill him because of that. Look here, Joey, you are a good fellow, and I will tell you what my trouble is, but you must promise not to speak of it to any one unless I say you may.'

The black-fellow laid his hand upon his lips and said gravely, 'Joey go bong first,' meaning that he would die before he betrayed his master.

And then Frederick Lane unfolded his whole story to the faithful, deeply attached aborigine. He was surprised as he told it to find what a relief it was—as is always the result in such cases—to be able to speak to some one about his secret trouble. To no white man dared he have opened his lips; but he knew he could trust his devoted attendant, though he had no hope of help from him. It was rather difficult to explain the incident of the forgery committed by another person, for Joey had no knowledge of paper currency, and only understood hard cash. But by using figures of speech, Lane contrived to make his innocence perfectly clear to the black-fellow.

Joey listened with the closest attention; he had already determined to deliver his master in the only way he saw possible; but the acute brain of the savage perceived that for the present, at least, he must dissemble. So he merely shook his head despondingly, and said, 'Plenty bad, plenty bad. Joey see no light.'

'Nor I neither, Joey. Go now and leave me. There's a good fellow. Good-night.'

When the savage retired to the outhouse which formed his sleeping-apartment, he squatted down on his haunches and began to think hard. He looked longingly at his little tomahawk and three spears which hung beside his shield on the wall—relics of his bygone warrior-days, which had often removed a troublesome enemy from his path—but shook his head regretfully. Killing by such means would certainly be traced to him. It would not do. Some other means must be found of paying the debt he owed to Frederick Lane. A small black object ran quietly across the floor close to him, and seemed to disappear in the shadow of the far corner. Joey idly watched its progress for a moment; then a thought seemed to flash into his brain, and he leaped nimbly to his feet with a chuckle of satisfaction. He had found the way; accident had put into his hands a weapon that would serve him well. Rising, he went to a small shelf, and took from it

a little, round, empty tin box. Removing the lid, he took a board in his left hand, and approaching the corner with cautious steps, he fenced in an angle of the corner. Then lighting a candle, he dropped on his knees beside the board and held the light over it. As he expected, a large black spider, with the ominous red spot on its back, rushed at the board, and began to climb up it rapidly in its effort to escape. This gave Joey the very opportunity he wanted. In a moment the tin box was clapped over the insect, the cover was quickly slid over it, and the prize was his own.

. . . . . .

Stunden was sleeping in the stable close to the side of a low wooden partition. The window was noiselessly opened, and a black figure stealthily and without a sound dropped to the floor. Creeping up to the other side of the wooden partition, Joey peered over it. His victim lay on his right side, his head pillowed on a truss of straw, his shirt-collar thrown open, exposing the bare, sunburnt neck and throat. Joey gently removed the lid of the tin box, and dropping the spider on Stunden's throat, instantly lay down on the other side of the partition, where he could not be discovered in the darkness of the stable.

Furious at its imprisonment in the little dark cell where it had been confined, and believing that the creature it now found itself in contact with was the cause of offence, the black spider tore and worried Stunden's throat with its poisonous mandibles before it rushed off to freedom and concealment in the truss of straw on which Stunden lay.

The man leaped up with a yell of terror and pain, and rushing to the stable door, fumbled for nearly a minute in vain efforts to find a handle. Then running out, he battered wildly at the back-door of the house, moaning with pain, cursing with helpless rage, and shrieking for assistance, declaring that he had been bitten by a snake.

The inmates were aroused, and came down instantly to his help, but could do little for him beyond sending off for the doctor, who shook his head when he noticed the two small punctures in the throat, and ordered his immediate removal to the town hospital.

In the case of a healthy, clean-blooded man there would have been a fair chance of recovery; but Stunden's blood-system was completely alcoholised by long excess, and his constitution thoroughly enfeebled. Within two hours he was in raving delirium, erysipelas in the head set in, and the end came rapidly; within twenty-four hours the blackmailer, tramp, drunkard, and wreck of all that he might once have been, and possessed the ability to be, had passed away.

. . . . . .

'Budgeree for you, Massa Fred. Dat snake bite bad white fellow; no good he; big thief dat one,' said Joey to his master the next evening. Joey's eyes twinkled as he laid the responsibility for Stunden's death on an imaginary reptile.

'It was very fortunate for me, Joey; but I can't help feeling sorry for the fellow's death.'

'You sorry? Mine tink dat plenty foolish. When Joey have enemy, Joey kill him, if can; and when Massa Fred's enemy killed, Joey plenty glad.'

And so Frederick Lane never knew the real truth of his deliverance by means of a faithful servant—and a terrible Australian black spider.

THOUGHTS ON AN ESTUARY.

By F. G. Aflalo.

THERE is the mystery of birth, and there is the mystery of death; the first retrospective, the latter for him who looks forward. Whether the mouth of a river, the point at which it dies in the salt embrace of the ocean, can ever have quite the same fascination for the traveller as its source is an open question; but at any rate this marriage of sea and river is among the most fruitful of all Nature's matchmaking schemes, and the offspring of the union of fresh and salt comprises a wealth of varied forms, terrestrial and aquatic, fluviatile and marine. The estuarine family is limited by the pretensions of its parents. The mighty flood of Mississippi, sweeping the drainage of a million square miles out into the unresisting waters of an almost tideless gulf, or the broad though latterly controlled wash of Nile, which piles its thousands of acres of delta over against the blue Mediterranean, even the puny outfall of Thames, will naturally give birth to a fauna exceeding that of the shallow lagoon through which the Lymington River drains the forest land into the Solent.

There is in most estuaries—great or small, broad or narrow, deep or shallow—one ruling condition of all animal and vegetable life; and that is the eternal give and take: the backwards and forwards movement of the water, and often indeed of the sympathetic breeze that follows the play of the waters, the ebb that bares and the flood which hides the rocks, mud, or jungle of waving weed. All this invigorating movement, which defies stagnation, circulates rich stores of food, and sends its message of invitation to all manner of animal guests, beckoning the weary salmon to breeding-grounds that lie snug above the gauntlet of the nets, tempting the graceful seal and rolling porpoise to feast on the salmon, calling down the crying curlew to a meal of cockles, the hovering osprey to a dish of sea-trout, the deliberate heron to keep vigil for smaller prey. The threshold which stands

between river and sea is a scene of continuous comedy and tragedy.

The estuary has a peculiar interest for the sportsman and naturalist in that it marks the highway, to all intents and purposes, for all the wildfowl and fishes that divide their life between the salt water and the fresh. The salmon and the shad, fishes that, while they draw most of their strength and substance from the sea, are yet careful to rear their family in the ancestral river, must pass that way to gain their spawning-grounds in the upper reaches. The eel and flounder, moved by contrary impulses, for the mainspring of which science still gropes vaguely, must likewise traverse the estuary *en route* for their breeding-haunts in the depths of the sea. Summer and winter alike the gulls float over the estuary on the lookout for such impure flotsam as satisfies their greedy appetites. Even the ducks and geese, driven south by the threatened famine of a northern winter, almost invariably follow the windings of the estuary in their morning and evening flight, unless they are driven to the choice of a safer route by the fusillade of punt-guns when on the feeding-grounds and fowling-pieces at the flighting hour.

Those who have voyaged across the world's seas can recall a score of estuaries that were very havens of rest after much storm-tossed travel; but we need look no farther than the Forth at Leith, the Clyde at Greenock, or the Tay at Broughty Ferry to grasp the salient features of estuarine physiography. To a mind's eye, however, which—though never forgetful of Scotland's beauties at a time when the fitful grouse glides unhurt past the unaccustomed gun—has dwelt more recently on the coast-line of the south country, other examples suggest themselves. The coast of England and Wales admits three seas into a score of estuaries, many of which differ in character no less than the streams to which they owe their being, while their human interest is equally divergent. Those of the Thames and Humber, though by no means quite uninteresting to the ornithologist or gunner, are chiefly important in the shipping world; while that, again, which opens between Berwick and Spittal, or that which, midway along the south coast, admits the joint waters of Stour and Avon to the calm embrace of the Solent, ranks high in the chronicles of our salmon-fisheries. Such estuaries as shelter fishing fleets—to wit, that between Hull and Grimsby—wane in attraction to the naturalist as they wax in industrial wealth. Of yore the Humber mud-flats were a famous hunting-ground of the autumn gunner; but I have stood of late atop the Grimsby Tower and scanned the uncovered banks through a field-glass without descrying fowl enough to be worth a cartridge.

In the narrower embouchure south of Great Yarmouth, which is also for the most part given up to the navigation of herring-drifters, strange fowl are occasionally seen in hard winters, and some have even found their way into the well-stocked bird-room of the excellent local museum. Better suited to the ambitions of the wildfowler living in London, and desiring only an occasional shot at duck, are the peaceful embouchures of the Essex watershed, the mouths of the Crouch and Blackwater, in the shelter of which amateur sea-fishermen may also in the short daylight enjoy sport with whiting and young cod, void of conflict with the ups and downs of the disillusionising open sea. For the sketch-block or camera, on the other hand, the greatest promise lies between such rocky walls as those which bound the lowest reach of the Fowey, below Lostwithiel, or the swift Mawddach as seen from the Barmouth viaduct.

In a measure, the estuary is the index to the river; in a measure, it is moulded in its contour by the action of the sea. The narrow mouth of a short, swift river which falls into the sea from a near source in a coastal range of hills is exemplified at Lynmouth, in North Devon; while at Southend, in Essex, we get the broader expanse through which vessels disembogue out of a long and navigable stream. Where the ebb and flow of the salt-water can carry away the muddy surplus of the land drainage, then, however great the daily tonnage of this burden, there will be no delta.

A special phase of estuarine topography is illustrated where two rivers of very different character join forces shortly before reaching the sea, and together make a way through the remaining obstacles. The two rivers that meet below Christchurch, in Hampshire, furnish a case in point. The peculiar interest of this riverine partnership—Drayton in his *Polyolbion* calls them 'sister' rivers; but so divergent are their features that they must at any rate be step-sisters—is best appreciated from the standpoint of an early spring salmon cruising along the north shore of the Solent with a fixed determination to return to the spawning-ground that instinct or memory, according to its age and experience, indicates as its proper goal. In the early days of its honeymoon, our salmon, with its mate, is whirled in on the last of the double tide past the Mudeford sand-spit, and, if luck be against them, into the corked circle of netting cunningly shot for their destruction. It may, however, come safe through the run; and, that accomplished, it finds itself, like Diana, at the crossways as soon as it has proceeded a little farther up-country. Straight before it runs the Avon, a crystal waterway, by stemming which it can reach the clear pools near Ringwood and Salisbury. To the left—with perhaps a danger-post erected by some public-spirited salmon: 'Beware the Pike'—creeps the more turgid Stour, meandering down from the lush pastures of Dorset over a muddy bed better adapted to the grosser requirements of coarse fish.

Our salmon rarely hesitates. That it sometimes does so is proved by the fact that about 10 per cent. of the salmon which are taken above the Mudeford nets come from the Stour, while 90 per cent. are from the Avon, in which the remnant left by

successive nets and Ringwood anglers spawn on the gravelly shallows beyond Fordingbridge.

For the angler, the conditions of sport in an estuary are almost wholly governed by the degree of tidal ebb and flow, by the relation between the opposed forces of sea and river. The flow of a broad stream into a tideless sea like the Baltic gives the fresh-water the advantage at all stages of the tide, and this is an important determining factor in the kinds of fish that the angler may expect to catch. Take, for instance, the mouth of the river Warnow, which falls into the Baltic between two piers at Warnemünde—a name bearing precisely the same geographical significance as Teignmouth—just as the Arun runs into the English Channel between two piers at Littlehampton. There is, however, a wide difference between the two, which only those who have fished from the piers in both Sussex and Mecklenburg can fully appreciate. At Littlehampton only such marine forms as bass, gray mullet, sand-smelts, and the like are taken on the hook, whereas at Warnemünde the same rod may within an hour bend to the weight of small pike, fresh-water bream, perch, plaice, and marine bull-heads. These river-fishes may often be taken on that pier within fifty yards of the break of Baltic waves, though at the extreme end, practically in the salt-water, the perch is the only inland form which persists.

With reference to the Arun, the capture of large bass above Arundel during spring-tides furnishes yet another illustration of the influence of the tidal flood on the fauna of a river. Not far above Arundel there are famous haunts of those who angle for coarse fish; yet during spring-tides the salt-water rushes beneath the bridge which at that town spans the river, carrying with it bass of large size. These may be taken on pike-tackle, with live-baits, until the tide again turns. Loiterers on the bridge are oftentimes puzzled by the spectacle of those in attendance on such sportsmen frequently dipping their fingers in the water and putting them to their lips; but as a rough-and-ready guide to the condition of the tide this is a safe test. As long as the water tastes salt to the tongue, the bass may be expected to bite; when it once more tastes fresh, the wise man reels up and goes home, for the bass have dropped back below Ford at any rate for that tide.

And now I linger on the beautiful shores of the estuary which first inspired these rambling reflections, that of the Devon Teign. It may lack the breadth of its neighbour to the north or the beauty of its neighbour to the south; but it fulfils its modest purpose admirably, giving shelter to strange foreign craft at the Teignmouth quays, and bearing to their moorings the clay-laden barges from Newton-Abbot. It yields a varying harvest to the salmon-nets at its mouth, and a little promise of sport to a few persistent rods higher up the river. Above the market-town of Newton the Teign is not remarkable for grandeur, but there is no lack of quiet picturesqueness in its last few miles; and the final sweep beneath the Shaldon viaduct, past trim yachts and weather-beaten merchant-vessels, and so, between the towering red Ness and the shifting bar, into the dancing waters of Teignmouth Bay, must be reckoned the first really memorable piece of estuarine scenery on the Great Western system. The mouth of the Exe is too broad to lend itself to scenic effect, which demands some distinctness in the background. The delta of the Teign takes the form of a growing mud-bank within the river, which goes locally by the name of 'Salty,' and which is an unfailing source of cockles. Village ladies, in company with rooks, curlews, gulls, oyster-catchers, and other strange fowl, unremittingly dig these bivalves from their shallow lairs. The sandbar outside the Ness shifts its position with every wind, and brings gladness only to the pilots who steer trading-vessels wide of its snares. It has hitherto successfully resisted every effort to make Teignmouth a popular yachting haven, and it will in all probability prove itself superior to the interruption offered by a powerful force-pump with which the harbour commissioners have lately essayed to blow a permanent way through its silting barrier.

It goes without saying that the bird-life of an estuary like that of the Teign is varied and interesting. The observant naturalist, particularly if he be an enthusiastic fisherman, and therefore early on the water, never knows what he may see next. Here is a public aviary that land and sea help to stock with abundance of forms. Kingfishers flash green and gold in the early sunlight beneath the bridge. Black rooks wheel over the gleaming river from their stronghold in the Bitton elms, and thrust their gray bills in the promising ooze. From the sea come many kinds of gulls, some of them suspended over the water on the lookout for refuse or small fry, others stalking over 'Salty,' chattering, fighting, courting. Aloof from the commoner fowl struts a solitary oyster-catcher, the chaste, sharp contrast of its plumage arresting the watchful eye. Shags and cormorants fly quickly overhead to and from scenes of inland havoc, higher than was their wont in the days before a wise conservancy put a price on their sable heads. The measure has unquestionably thinned the numbers of these robbers of trout, yet they are too cunning to be altogether banished by the crude marksmanship of local pot-hunters. One morning last spring there was, even amid this miscellany of sea and land birds, a young puffin, a mere wind-tossed chick, blown out of its course during a three days' easterly gale that carries the sea-spume well into the river. The grotesque head of the ungainly little wayfarer was lost to sight as it paddled and plunged among the tiers of vessels that swung at their moorings, and we prayed that the bird might return in safety to the open sea ere the muzzle-loader of some omnivorous Italian aboard one or other of the Genoese or Neapolitan brigantines should blow it to a pulp. These be the birds of summer. In the

shorter days, when the rod lies by and the gun is off the rack, there are a few duck and widgeon, with golden plover and curlew, going and coming, and from the frozen meadows that lie beyond the railroad comes the eternal scream of wheeling pewits.

The fishes of this estuary are not less varied than the birds. There are salmon and sea-trout, the latter locally known as peal. There are bass, often of good weight and always in evidence, as seen from the bridge on days when there is no live bait for their capture. There are a few shad, abundance of flounders, fat river-eels, with a stray conger or two, small pollack in the 'Pit' off Shaldon; and in the hottest hours of the hottest summer young mackerel in their thousands play well within the bar. The launce and sand-eels are too plentiful, the garfish and angler-fish too rare, to call for notice, though all of these must find a place in any comprehensive list. Even the gray mullet, which occupies the second place in the sea-angler's game-list, has been indicated by the men on the clay-barges; but no resident sportsman ever yet succeeded in taking one on the hook.

The angling in the estuary is all for bass, and very interesting work it is on days when the live bait is lively and the big bass ready to feed. The one serious drawback is the weed, tons of which seem to float in on every tide, returning on the ebb so as to be ready to worry the fisherman when next the tide flows. This evil reaches the acute stage in the hot summer weather, when the weed, dislodged from the bed of the river by the salmon-nets, is thrown high and dry, all the moisture burnt out of it by the fierce July sun; then, as soon as the waters rise over it, the weed floats away like cork instead of keeping its proper place on the bottom of the stream. When it is added that no bass will take a bait with a perceptible shred of this green weed adhering to it, the impossibility of success under such conditions is self-evident.

The four-footed life of such an estuary can only be indicated as undistinguished. In the way of permanent residents there is nothing more than the humble rat. Its holes and footprints scar the mud in every direction above the tidal influence, and in times of stress it makes its unclean raid to the very margin of the sea. Now and then, it is true, more important mammals visit the estuary; but their coming is rare. When its more natural haunts are invaded by loud-tongued hounds and iron-shod poles, a sleek otter may seek temporary asylum in the estuary. Once in a generation a misguided porpoise, perhaps in blind pursuit of a salmon, perhaps out of sheer waywardness, finds its way inside the bar, and its presence in the river is quickly known. As a result, the next few days are marked by a fusillade of weapons new and old from the bridge, and there is much scheming with a cordon of nets. When the undeceived cetacean has set the country-side by the ears, it snorts its *ave atque vale* and heads for the open sea, undeterred by either the gleam of rifle-barrels or the stretch of netting.

Between the residents and visitors among the birds and fishes there is a distinction as sharp as that which divides the residents and visitors in the neighbouring town. The rooks and gulls that live all the year beside the mud-banks, or the eels and flounders that, until the spawning instinct prompts them to seek deeper water, are content to lie in the ooze, can never be confused with the wandering wild-duck and plover, or the nomad salmon and peal. These visitors, like the strange balconied sailing-ships of many flags, link the estuary with foreign parts.

Looking out of my window on the ever-changing face of the estuary, I am brought back to the immutable law of movement, the reflex action of the tides, the reasonable give-and-take policy controlled by the moon. Each turn of the tide sets the smaller craft swinging in their own length. There is coming and going without end, ebb and flow, vigour that knows no fatigue and seeks no respite. Unless a contrary wind holds up the waters for a short space, the flood follows immediately on the ebb. Ferrymen pull unceasingly in muscular rivalry of the inanimate foot-bridge. Hammers resound in busy shipyards. Pilots are hailed in a polyglot of raillery.

Under such auspices is accomplished the marriage of river and sea. And the vestry records which cold-blooded, unimaginative readers of stones and bones call estuarine deposits reveal to the understanding eye some of the most fascinating entries in the unlocked diaries of Nature.

TO AN OLD HOUSE.

Thou hast the Past: the memories that can bring
Deep sense of peace, of rapture come and gone,
Old sorrows and old comfort. Eyes that shone
And feet that danced, voices that ceased to sing,
Feet that were very weary, bore their part
In all the charm that crowns thee—gray, alone—
Where in the dusk thy chambers, stone on stone,
Hold close the wistful secrets of the heart.

Thou hast the Past. The spell of yesterday
Meets 'neath thy gables with new hopes to be,
With long-familiar thoughts that cling to thee:
Thoughts that will last when we are gone away,
And forward from thy threshold fare, to know
Some wider life beyond, untried as yet.
Say, hast thou not some window, darkly set,
That looks upon the Land to which we go?

Say, does no spirit-window, crystal clear,
Look on the garden of the vanished dead?
No secret doorway open to their tread
In all the house that holds their memories dear?
Is thine some link that binds them as they roam
In alien fields and haunts of deeper rest;
And in the golden dwellings of the Blest
Still do they call thine ancient shelter *Home*?

FINSEN.

By G. M. FOX-DAVIES.

WHAT is a great man? If Hamlet be right, and 'there's hope a great man's memory may outlive his life half a year,' we cannot be so poor in personalities as some would have us think, for great men are not forgotten in six months. Even the lesser stars do not fade quite so soon from memory's firmament. We may safely make the test a little stiffer. Some types of greatness, though, seem to possess greater vitality than others, appeal to a wider public, and make a deeper and more permanent impression. Such are the great rulers, the great soldiers, and the great doctors of the world. Several names spring at once to the lips of every Englishman when blessings are called down on the medical profession, such as those of Harvey, Jenner, Simpson, Lister, and Finsen. Finsen's work is not to be estimated by counting up the number of sufferers he has restored to life from a living death, nor yet by calculating the endless numbers who may yet be benefited; his discovery of the deleterious and healing effects of light means far, far more than that. It means that, like Harvey, he has revealed a new law to medical science, and opened up a new field of research, the possibilities of which are still far from being exhausted; it means that, like Jenner, he has already robbed one dreaded and loathsome disease of half its terrors, while others seem to have heard their death-knell too.

And, despite the sufferings he fought against so bravely, and which at last proved stronger than he, dare we pity him? Hardly. His life was noble and unselfish, a life of fighting and struggling, as the best lives always are, even though the foe do not always wear the same face; and those who have endured to the end need no pity. He lived, too, to complete his work, and what can one ask more of life? Complete, in the strict scientific sense, of course it is not, and possibly it never may be; but its development, thanks to the disinterested behaviour of the founder of the Light Institute, may now be safely left in other hands. Finsen himself formulated a new and great theory, reduced it to successful practice, and launched it on the world. Lastly, his was no unloved life, and that means much. Of singularly winning personality, he attracted the affection of comrades, colleagues, and friends; he won a charming wife, and lived to see children grow up around him. One of the last wishes he expressed was a pathetic one: he said one day that he should like to live long enough for his little son to remember him. The boy was born in September 1896; one wonders how much he will be able to recall in after-years.

The facts of Finsen's career are soon told. Niels Ryberg Finsen was the son of Hannes Christian Steingrim Finsen, Civil Governor of the Faroe Islands, and was born at Thorshavn, December 15, 1860. There he spent his early years, and to the last he retained his old affection for the place that saw his birth. He went to school first at Herlufsholm (in the Danish island of Sjaelland), then to the Grammar School of Reykyavik in Iceland; but neither then nor in his subsequent university career did he raise any very great hopes for the future in teachers or comrades. Perhaps none were more surprised than they at the fame he achieved afterwards, though there was at least one master who prophesied that something would come of the strange, apparently idle, experiments of the silent young student with the deft fingers, whose interests seemed so different from those of the rest. Even in his examinations he never took more than a second-class, though whether this was because he really did not trouble himself sufficiently about the ordinary routine studies required of him, being too much engrossed by other and more congenial branches, or whether examinations are not a reliable test of acquirements, it is idle to discuss. When a man has reached the pinnacle of greatness, after bold and original researches demanding patience, skill, and accurate knowledge for their successful accomplishment, it matters very little whether he was, or was not, apt in the conjugation of Latin verbs. He had matriculated in 1882, and taken up his residence in

[*All Rights Reserved.*]

Copenhagen the same year, to study medicine. He took his degree eight years later, this being by no means an unusually protracted period of study for a Danish medical man. He suffered even then from the painful and insidious complaint which eventually carried him from the scene of his unselfish activity. The *post-mortem* examination of his body has established this to have been what is technically known as calcination of the pericardium; heart-disease proper, in the usual sense of the word, being non-existent. His sufferings were probably the result of an attack of rheumatic-fever years before, and not due to any organic defect. On obtaining his degree he was appointed demonstrator in anatomy at the Surgical Academy of Copenhagen, a post for which his qualifications peculiarly fitted him, and which he held three years. In July 1893 he published the result of his first series of researches in a treatise on the treatment of smallpox by red light, an idea by no means new in itself, but which had hitherto been regarded as little better than a superstition. He, however, for the first time, gave an adequate scientific reason for such treatment, pointing out that if the blue, violet, and ultra-violet rays, which irritate the skin and favour the growth of certain malevolent bacteria, could be kept from the patient, inflammation would not ensue nor any scars remain. His theory was tested with excellent results shortly after, during an outbreak of smallpox in Bergen, and again a little later in Copenhagen. Not only did patients treated in the 'red room' escape without disfigurement, but the whole course of the disease was much milder. The same treatment has proved beneficial in cases of measles and scarlet-fever, and hopes are entertained of its also being efficacious in dealing with erysipelas.

But Finsen's greatest discovery, the possibility of healing through the *beneficial* effects of light, was yet to come. From his earliest student days he had studied and experimented on the effects of light on living organisms, his attention having been first attracted to the question by noticing that he himself was able to work better and more easily in the sunlit room of his comrade, Sophus Bang—now head physician to the Silkeborg Sanatorium—than in his own dark, cheerless one, which opened to the north. He read up the subject to ascertain what had previously been observed and recorded, but discovered, to his surprise, little or nothing. Almost simultaneously with Finsen, other doctors had begun to take notice of the action of light-rays, notably Dr Wiedmark of Stockholm; but to no one else did it occur to try to make any practical use of the facts deduced. In the autumn of 1895, with primitive apparatus, but firmly convinced of the truth of his theories, Finsen began to treat his first lupus patient, an engineer who had vainly tried every cure during the eight years he had suffered from the disease. This first case proved successful, and in April of the next year a little circle of medical men and others met to discuss the establishment of the first light-ray hospital for *lupus vulgaris*. Two prominent and wealthy Copenhagen gentlemen gave generous pecuniary support, and the Municipal Council provided the ground for the building. This, however, even with augmentations, soon proved insufficient to cope with the work, and in August 1901 the present handsome edifice was opened. Now there are between twenty and thirty such institutions in different parts of Europe, and lupus, a disease that was once justly regarded as practically incurable, need no longer, if taken in time, be regarded with apprehension. Other skin diseases—rodent ulcers, for instance, which are a kind of cancer—are found to yield to the healing efficacy of light, and the future may reveal developments hitherto unsuspected.

Had Finsen elected to do so, he might have kept his secret to himself, and become a rich man, but he chose the nobler alternative of benefiting humanity at his own cost in every branch of his researches; for we must not forget that Finsen did not confine his studies to the cure of lupus, nor even to the action of light alone, though it is, of course, with the first-mentioned that his name is more especially associated for Englishmen. It was also, as every one is aware, his discovery of the lupus cure which earned for him last autumn the greatest distinction that Europe can confer upon her men of learning, the Nobel prize. The manner in which he bore his honours is characteristic of the man. He could not, he said at the celebration held at the Lysinstitut on that occasion, regard the prize as given to him personally, because it was impossible to separate his deserts from those of his colleagues and co-workers in the institute. Nor, as a matter of fact, did he retain more than about a fifth of the sum for his personal use; the rest he divided between the Lysinstitut, which bears its name, and the Hospital for Diseases of the Heart and Liver, also founded by himself, the progress and welfare of which were equally near to his heart.

The greater part of last summer was spent by him at Rungsted, a little seaside resort in E. Sjaelland, in the hope, destined to be unfulfilled, that his health might derive advantage from the country air. He returned to Copenhagen, however, without having been benefited in the least from his stay. Still, his condition, grave as it was, was not considered to be one of immediate danger either by his doctors or his friends until a very few days, one might almost say hours, before his death. He took to his bed about the 19th of September, but even then the end was not anticipated at once; he himself knew, however, that it had come, the enemy he had kept at bay so long, and he calmly calculated how many hours he still had to live. At five o'clock on the afternoon of Saturday, September 24, the younger doctors on the hospital staff were told that Finsen had asked for them. He received them, one at a time, with a smile on his face, shook hands with them, bade them farewell, and with a few kind words thanked them for their helpful co-operation.

About thirty-five minutes afterwards he breathed his last, conscious and himself to the end.

Thus died one of the greatest heroes of our age, a man whose character no less than his work claims the respect and admiration of his contemporaries. Had he lived to carry out his schemes for the improvement of medical education in Denmark, or to complete the researches he was engaged upon when he died, he could hardly have shed greater lustre on a name already honoured throughout the civilised world. For an article on the 'Finsen Red-Room Cure,' see *Chambers's Journal*, 1902, p. 220.

GIANT CIRCUMSTANCE.

CHAPTER IV.—AND WHAT IT WROUGHT THERE.

'NOW, Charles, tell me the exact truth of this matter,' said Ellen Challis as soon as she and Doone were alone, the General having gone off at once to visit his old friend Brading in the little end-house in South Stanley Street Mews. 'Uncle George and Mr Devon have been doing their best to tinge the gray with rose; but I doubt them,' with a knowing shake of the head. 'I have no liking for fool's paradise. Tell me the worst.'

'What they have told you is perfectly right, dear, as far as it goes. The arrest, and the inquiry, and so on are matters of form always observed under such circumstances. My only fear is just what I stated: whether they will give him fair-play, and I'll badger Devon to death till he gets it. Those army-men, most of them—not all, of course; there are as fine men in the army as there are in the navy, or almost—but they certainly have a trick of evading responsibility when they can. It's always the other fellow who didn't act up to orders, or went beyond them, or didn't understand them. And it is, of course, very unfortunate that the cause of all the trouble happened to be so important a man as Eisenach. He was the last of the direct line, you know. There will be much warm talk. The French and German papers will have their little fling at us, no doubt. The army-men will bubble and froth, and then there'll come a big fight up the Nile, and a new society scandal, and most folks will forget all about Eisenach; and when they find themselves wondering where he is, they'll catch themselves up just in time and say, "Oh, poor chap: he's dead, isn't he?"'

'What are they saying about it outside?'

'I've heard very little talk yet—only regrets for Eisenach. There is so little to go upon beyond that, that sensible people will hold their tongues till they know what they are talking about.'

'But the first feeling is against Geoffrey?' she persisted.

'The first and strong feeling is, as it always is, that some one must have blundered, and they want to know who it was.'

'How long will the official inquiry take?'

'A couple of days at most, I should say. They have everything right there to their hands.'

She could get no more out of him for all her trying. They were always perfectly open and frank, these two; but it falls to the lot of the man at times to protect the gentler souls from the world's rude buffetings by any means that seem good to him. And Charles Doone would no more have judged it right to tell her the cackle of the smoking-rooms on this subject than on many another.

On the whole he managed to reassure her somewhat, more by his bearing than by his words, for, as he constantly said, 'We have nothing to go upon yet except our knowledge of Geoff, and there we stand on firm ground. If ten courts-martial condemned him, I would accept his word for it against the lot.'

As he was swinging away home to the silent house in Hyde Park Terrace, where his brother lay drifting slowly towards the larger life, to sit with him for an hour and give him all the news that was going, before dressing and getting back to Ellen, he ran into General Carrick, tramping martially homewards from South Stanley Street Mews.

'Doone! you're the very man I was wanting. Tell me straight now, what do you think of all this?'

'Do you need to ask that, sir? You know Geoff quite as well as I do.'

'God bless you, yes! That's how I feel about it too. But—well, I don't know. Will he get fair-play?'

'Up to a point, he will, sir. You know that as well as I. After that, if some one has to stand the racket, I'm afraid a good deal depends upon whose head might fall if his didn't. You know what I mean. Facts are often a trifle nebulose, and they sometimes twist a bit under stress of circumstances.'

'Yes, I know,' nodded the General. 'Tell me, Charles, what are they saying in the clubs?'

'Just what they always say when anything goes wrong, General—that things are going to the devil, and some one ought to be shot. We're nearly as bad as the Frenchmen in some respects, only we generally come to our right minds in time.'

'We do sometimes. Will you be round again?' He actually surprised in himself a lurking fear lest Charles Doone should be running away from a ship that had suffered a wound. But you will understand he was seventy-five years of age, and this upsetting news had given him a bit of a shake.

'Of course. I'm just going to cheer up poor old Ex. I'll be round as soon as I've made him laugh three times.'

'I doubt he's going, Charles.'

'I'm afraid so. He has no reserves to fall back on.'

'Pity! pity!' and they parted.

It was two days before they got any further news, and during that time Una never left the house. She let a dinner-party and two dances go by unheeded, and kept mostly to her own room. She saw no one but her mother and her maid, and Lady Eugénie's conversation was not inspiring.

Ellen Challis and Lord Charles, on the other hand, went about as usual with bravely cheerful faces, and the General went as usual to his club, and flushed at times at the pregnant silences that supervened when he strolled into the smoking-room. For there was much discussion of the matter at the clubs, and at times it grew heated, which, to say the least of it, on the meagre information so far to hand, was extreme waste of energy. But the old gentlemen of the service clubs are apt to be didactic and explosive, and able to show you in two minutes how much better things would have been managed if they had been in their hands; and no great harm was done.

On the third day came a cable from Upper Nile, which stated simply that the court of inquiry in the case of Lieutenant Challis had decided that he should be remitted to a court-martial under the presidency of Colonel Essex on the charge of misbehaviour before the enemy.

Mr Devon sent a copy of this across at once to General Carrick, with a line of his own:

'Dear Carrick,—You will not let this trouble you unduly. It is the formal charge under the circumstances. Geoffrey may possibly have momentarily lost his head in the dervish onrush. Fifty to eight, and a surprise at that, was heavy odds. Of his courage no one is doubtful for a moment. In any case, the finding of the court-martial must come home for review by the Judge-Advocate-General, and we shall soon be in possession of the full facts. Kindest regards to Miss Challis, and beg her not to worry herself unduly.'

The very formulation of such a charge, however, seemed to Ellen a cruel slander; and a composed face, to say nothing of a cheerful one, was not easily carried under such circumstances.

Even Charles Doone's breezy hopefulness could maintain nothing more than an unruffled calm. But, beneath the placid exterior, his feelings were hard braced, and his teeth tightened now and then inside the quiet, smiling cheek at things he heard bandying to and fro in the smoking-rooms of his clubs and elsewhere.

'Shoot him, I expect,' he heard one day.

'Well, so they should, if it's true he left the other to be killed and never lifted a finger to help him.'

'Don't be fools, you fellows,' he rejoiced to hear from another. 'You gab away like parrots in a monkey-house, and don't know what you're talking about. Like enough some one deserves to be shot; but I bet you it's not Geoffrey Challis. I know him, and he's a man all through. Now, if I was shooting, I should look about for the people that let that hunting-party go out with an escort of six into a country where dervishes were apparently as thick as blackberries. Didn't know it? Well, confound it, man! why didn't they know it? It was their place to know it. What are they there for but to know such things? And can't you understand that Challis is only a lieutenant, and Eisenach was honorary captain and must necessarily have been in charge? Do you think for one moment that any such fuss would have been made if Challis had been the one to go under? Can you imagine His Highness of Eisenach being court-martialled for not fighting fifty black tigers with his fists? The rot some of you fellows talk is something sickening. I should like to know what you would have done yourselves under the circumstances.'

The others smoked imperturbably and ordered fresh whiskies and sodas, and Doone sat down by the side of the last speaker, clapped him on the knee, and said, 'Thanks, Trevor! I'm glad to hear some one sticking up for the under-dog. It used to be a national attribute. I'm afraid it's dying out at this end of the town.'

'Gabble such as theirs doesn't mean anything. They haven't got much brains, and what they have is muddled with cigarettes and whisky, and having nothing to do but talk foolishness. How's Exmoor?'

'Bad. Hopeless, I'm afraid.'

'I'm sorry. But there's only one man to blame for it, and that's himself,' said the downright one. 'He's racketed his life away as if he'd as many to follow as a cat.'

'He's paying for it,' said Doone, with a sober nod. 'And I really think he's sorry.'

'Sorry for what he's done, or for what he can't get doing?'

'Well, both perhaps. He's very low.'

'I'll give him a call if you like and cheer him up a bit.'

'N-no, I don't think you'd better, perhaps. I'm afraid he's past all that. He suffers a good deal, and the doctors say he may go off any day.'

'Poor old chap! What a pace he used to go! But one always has to pay the price. What are we going to do for Geoff Challis, Doone?'

'What can we do, Trevor—except the kind of thing you've just been doing? That was very well done, though it's kind of wasted on these empty heads.'

'Well, I've been thinking. I know one or two newspaper men, capital fellows. Popham, he was out with us in Afghanistan; and Kerrison, he was with us in the Zulu business. I'm going to look 'em up and show 'em the rights of this affair. For I swear Geoff Challis is clean-handed in the matter, whoever it is that wants to shuffle the blame on to his shoulders. I don't know a man I'd sooner trust with my life than Challis, unless it's yourself. And you know me well enough to believe that when I say that I mean it. If I thought the opposite I would say it just as plainly. There's a terrible amount of

humbug in the world, and it's a pleasure to prick holes in it, and say what one thinks about it, when one gets the chance. But there's some good too, when you know where to find it; and I'm not going to stand by and see a man like Challis slanged and run down behind his back by smug little pups that aren't worthy to lick his boots. I'm going to write to the papers myself, too. A man that's lost his leg and got the V.C. carries a certain weight in the popular mind, and the popular mind is a pendulum that swings fairly true on the whole, though it gets joggled off its beat now and again in emergencies. All I want to impress on people at present is to go slow and wait quietly till all the facts are known, and, when they are known, to see that the whip is laid on the right back, if any whipping is to be done.'

'Do you know that you're a most excellent fellow, Trevor?'

'I've had a suspicion of it all my life, my boy; at least, since I came to years of discretion, and that was when I lost my leg. How does Miss Challis take it?'

'It hurts her, of course, though she has perfect faith in Geoff, as we all have who know him.'

'And Miss Devon? I bet you five to one that affair runs off on this siding, Doone. And if it does, I consider Challis is the gainer.'

'It'll hit him very hard if it does.'

'She's as pretty as a picture, but I think our man could do with more heart and more brains in a wife. I had a chat with the General to-day. He was looking a bit hipped too, I thought, though he puts a bold face on it.'

'Yes, he's feeling it.'

Colonel Trevor was right. General Carrick's anxiety over Geoff's trouble, and the consuming fire of his wrath, which no outward expression could adequately relieve, were telling on him.

His faith in his boy's fidelity and courage never wavered for one moment, but he feared, overmuch perhaps, lest in the strife of interests Geoff should go to the wall. He could quite imagine him wrapping himself in a lofty reserve through sheer disgust at being called upon to defend himself against a charge which in itself was a stain upon his honour. He knew the fine quality of the boy's temper, and how the very suggestion of default would wound him to the quick and drive him into his shell, where in another it would serve but to rouse him to the fight. He did not for a moment believe that Geoff had done, or omitted to do, anything worthy of censure, much less of the punishment of a trial. As to misbehaviour before the enemy, it was the man behind such a charge that ought to be shot, not the man in front of it. Whatever they made of it, he did not for one moment believe any very grave punishment would follow; but anything less than fullest acquittal would close the boy's career and break his life. And the strain of his anxiety was great.

He was not, as a rule, peculiar among his clubmates for any mincing of words or reticence of expression. The old fire-eaters revelled in the most outspoken comment and extreme luridity of diction, with only one exception—old Major-General Burt, who sat among them without a word. That, however, was through no lack of desire, but on account of a bullet which had gone through his face just below the cheek-bones and stopped his talk for ever. He was a famous listener, however, and enjoyed the fulminations of the others to the last letter, and scribbled his own contributions on a pad, and then burnt them at once lest they should set the premises on fire or corrupt the morals of the attendants. When there was no fire he would strike a match with a sound like a curse and burn his thunderbolt, and the sound and sight of the holocaust were concrete expression of the inflammability of his feelings which did him a world of good, and topped all the mere verbal expletives of his fellows. When, at times, he got so excited that he could no longer write, a vehement nod to any one of his cronies would always turn on a friendly tap of special objurgation for his relief. And the tap had been turned on freely on Geoff's behalf, for he and Carrick were very old friends.

But, all the same, the General took to sitting apart now, in brooding silence, and was hardly to be drawn out of it, even when Lord John Ercle had to flee for his life for indulging in heresies on behalf of the War Office, where he had the misfortune to be one of the Under-Secretaries. To a man the old warriors stood up for Geoff, because he was Carrick's boy and they liked Carrick, and because every man of them had more or less of a grievance against the powers that be, and refused to believe any good of them upon any consideration whatsoever.

Public opinion and the comments of the press had been so far decidedly adverse. They had little to go upon save the bald facts of the disaster, and, since disaster does not come as a rule of its own accord, human nature clamours instinctively in such a case for the delinquent's head. Whence burden-shiftings, scapegoats, and vicarious sacrifice.

General Carrick and Charles Doone were for writing to the *Times*. Ellen with difficulty persuaded them not to do so. She felt, as she knew Geoff would feel, that if the simple truth of the matter, which they had not yet learned, did not suffice, no special pleading would avail. She maintained that dignified silence was preferable to columns of print, when they none of them knew exactly what they were talking about; and, besides, special pleas from Geoff's own relatives, actual or prospective, even though they were pleas only for reservation of judgment, would be discounted, and she herself looked upon them as a sign of weakness.

Colonel Trevor, however, claimed a hearing on account of his V.C. and wooden leg, and wrote some strong, sensible letters, showing up the gross injustice of condemnation on a half-told story; and these were not without their effect. He egged his war-correspondent friends along the same track, and the public began to believe that there might possibly, after all, be another side to the question of Lieutenant Challis's alleged default, and the discussion of the

matter, both private and public, became somewhat more reasonable.

They were days of bitter waiting, however, and news trickled through with aggravating slowness. Nile headquarters were very far away, and the wires to the base were entirely in the hands of the military; and on this subject, which did not redound to their credit, the authorities exercised a most rigid censorship. But at length there came through a meagre message to the effect that the finding of the court-martial was being forwarded by mail to the Judge-Advocate-General, and would arrive in England a week or ten days before Lieutenant Challis, who was to sail under arrest, on the transport *Serpent*, two days later.

General Carrick posted across to Mr Devon in a state of furious excitement, which was not good for his health.

'Now, see here, Devon, what the —— Oh, man, there's no words strong enough! What is the meaning of this?'

'I'm as surprised and annoyed as you are, General.'

'Annoyed!' and the old man looked at him with obvious suspicion. 'Man! I want to rend and tear! Infernal hole-and-corner business! It's not —by Gad, sir! it's not English treatment this. There's some miserable hanky-panky going on, and they're ashamed of it. That's what it is, sir.'

'If there is, General, you know me well enough to be sure that I know nothing of it. I saw'——

'Can't you wire 'em to table the cards and play fair? Gad! what this country is coming to! It's enough to make one want to become an American. I swear it is.'

'I was going to tell you that I saw the Judge-Advocate-General at once on receipt of this, and he says they are quite right. The matter is still *sub judice*, you see, until he has passed upon their finding, and confirmed it or otherwise. Geoff shall have justice done him if I have to turn the War Office upside down.'

'And the sooner the better!' snorted the General, and went snorting home.

There he found a letter from Geoff awaiting him, and Ellen and Charles Doone hardly able to keep their hands off it till he came.

'Now we shall know something;' and he ripped it raggedly open. 'Read it, Nell. I've just been flaying Devon, and I'm getting old for so much excitement.'

And Ellen read:

'My dear Uncle,—You will both understand why I write to yourself instead of Nell under present discomforting circumstances. That you are both having bad times on my account I am sure, but I am really in no humour for writing, and do so only to give you the plain facts on which you may form your own judgment.'

Then he related with clearness and particularity the occurrences of the day of the hunting-party and the Prince's death, and ended:

'I cannot find in what I did that day one single thing to reproach myself with, though there is much that I regret. Bear in mind, I was not in command of the party, and I gave no single order throughout the day until my superior was down, when the command, of course, devolved upon me. Colonel Everett's word to me, to see that the Prince got into no mischief, was in no way an official charge, and would not have warranted more than advice on my part, even if the Prince had deliberately tried to run into mischief, which he never did.

'Cameron tells me the colonel has expressed himself to the effect that in my place he would never have come home alive. I wonder if the colonel can imagine how much easier it would have been for me not to come home at all, and how tempted I was to settle matters cleanly and comfortably that way. But I could only have done so by deliberately throwing my life away—in other words, by committing suicide. The moment I found out that the Prince was down, which was only when his empty horse galloped up alongside me, I turned. But there was absolutely nothing to be done. I saw all the trouble that would come of it, and I was sorely tempted to ride back and stop there. But in my judgment—and the time for consideration was the fraction of a second—I should have done the wrong thing. It was so much the easier thing to do that it was bound to be the wrong one. It appealed to me as a weak means of escape from the consequences of a disaster for which I knew I should be called upon to answer, and about which I should probably be misjudged, but which I had been absolutely powerless to prevent.

'Court-martial takes place to-morrow. Colonel Essex to preside. I stated the simple facts at the inquiry, which I myself demanded as the best way of ventilating all the circumstances of the case. Their decision to proceed to court-martial on a charge of misbehaviour is a shock to me. I don't know quite what to make of it. I have said my say, however, and I am strongly inclined to say no more. The facts are there. If, out of them, they can construct a charge of misbehaviour, words are useless.

'I cannot understand the matter, unless it is that, for reasons which are beyond me, trouble is expected, and I seem the most likely scapegoat. And yet I cannot see that any one was to blame. Also, I cannot help wondering, if fate had allotted it to me to fall and the Prince had escaped, whether they would be trying him for misbehaviour.

'I suppose my career in the army is ended. It is very bitter. I had had such hopes. I cannot help regretting at times that I did not, after all, choose the easier way out, even if it were the baser.

'Give my love to Nell and to Charlie Doone if he is home now; and tell them not to worry about me any more than they can help.—Yours, Geoff.'

'What do you make of it all, Charlie?' asked the General, in the silence that followed.

'Just what you do, sir. They've lost their heads

a bit out there over Eisenach's death. They think some one will have to pay, and Geoff seems the most likely man. I cannot see in what smallest thing he was to blame.'

'Nor can I,' said Ellen.

'I would very much like to send that letter to the *Times*,' said the General.

'I don't think I would, sir,' said Doone. 'I doubt if Geoff would like it, and it is possible it might do him more harm than good in some quarters.'

And eventually the General was prevailed on not to do so. But he took it down to the club and read it to his friends there, and they spent a hot afternoon discussing official delinquencies in general and this one in particular, and were confirmed in their opinions that matters were worse in the service even than they had been when they were in it.

The same mail brought full accounts of the whole affair from the correspondents in camp, and the popular judgment swung suddenly round in Lieutenant Challis's favour.

Some of the leading papers gave illuminating leaders on the subject, and lectured the world in general on the folly of jumping to conclusions and passing judgment before hearing both sides of a case. Colonel Trevor's friends' papers exultantly quoted the opinions they had somewhat reluctantly fathered, and cried 'Told you so!' in dignified paragraphs, and Geoff's friends rejoiced openly.

The War Office found itself—as usual, said the General—in a position of some difficulty, and Mr Devon, in the privacies of his own inner sanctum, used language which in another place would have held him up to reprobation. For there could not be a doubt that the finding of the court-martial, which would arrive in a few days, was an adverse one, or why send Challis home under arrest? And there could not be a doubt that it would be received with a howl of disgust throughout the land.

So the Right Hon. Ainslie found himself between two fires. He naturally desired to stand as well as any Secretary for War could ever hope to stand with the people and their representatives in the House, and he had no desire to provoke resentment in the army by acting contrary to its views. He foresaw that, however he might act, he must inevitably offend one party or the other, and he felt strongly inclined to get out of the muddle by sending in his resignation—just as Geoff had felt out there in the desert—which would be a somewhat bitter thing to do. It was not, perhaps, surprising that, under such circumstances, some of the resentment he felt at things in general settled on Geoffrey Challis as the original source of the troubles that beset him. He recognised the sentiment as an injustice to Geoff; but it was there, and there is little doubt that it influenced him later on.

Meanwhile he had the Judge-Advocate-General to fall back on, and he hoped that that astute friend would be able to find some way of cutting the knot which might satisfy all parties without in any way putting a spoke in the wheels of justice.

And during all these trying days Una Devon had been invisible to her friends. She went nowhere; and Ellen, when she called, learned only that Miss Devon was indisposed and could see nobody.

And Lady Eugénie indulged herself in much plain talk, till at last, like a dutiful daughter, Una came to see things with her mother's eyes, as a dutiful daughter sometimes does. Dutifulness is a charming virtue, but it is not the only virtue. There are others of robuster growth, and there come times when, through the wilful closing of the heart against higher claims, even the practice of a virtue may be but a sign of weakness and selfishness.

In some, the time of stress and storm evokes all the combative goodness of their natures. These are the Great-Hearts of life, salt of the earth. Ellen Challis could no more have turned her back on Charles Doone—no, not if he had been convicted in open court of scuttling his ship—than she could have plucked her heart out. She would have grieved, indeed, to the verge of heart-break, and then with a brave, white face and swimming eyes, and the bruised heart painfully insisting that it was not the Charlie she knew who could have done such a thing, she would have groped to his neck, and brought home to him the certainty that there was still one faithful soul that believed in him, though to all the rest of the world he was outcast.

But then Ellen's heart was wholly Doone's, and that makes all the difference in the world.

A COTTON-GARDEN IN NIGERIA.

By Constance Larymore.

N these days, and in the immediate future—when economic development is superseding military operations, the sword turning into the ploughshare, and the Mother Country is looking anxiously across to Nigeria, not for conquest but for cotton—it may be that new names and new districts will spring into prominence, and the British public will speak more familiarly of the great rubber and cotton growing areas in the southern provinces than they have been wont to do of Lake Chad or Sokoto.

A botanical expert who has been, and still is, travelling over all parts of Northern Nigeria, with a view to its future development from an agricultural point of view, lately expressed to me his opinion that, with the exception of the Bassa Province—lying between the Benuë River and Southern Nigeria, on the left bank of the Niger—no district that he has, so far, seen offers so rich a

field for the cultivation of cotton as the area of land lying around Kabba.

Many to whom Kano and Sokoto are now familiar words will ask, 'Where on earth is Kabba, and what is it?' Well, Kabba is a small town situated in the centre of the province bearing its name, which lies between Ilorin and Southern Nigeria, having the right bank of the Niger as its boundary on one side and Lagos territory on the other. It is not on the way to anywhere in particular—at least, anywhere that draws the stream of white men so ceaselessly passing up and down the highways of the Protectorate; it has no great political importance to drag it into prominence—no Emirate, with all the pomp and circumstance attending a powerful native ruler; it has none of the glow of mystery and attraction about it which hovers over Kano, Sokoto, and the north generally; nor is it on the path of the immense caravans which throng the northern routes. These either end their journey at Ilorin, and return north laden with fresh merchandise; or else, passing down through Nassarawa, divide themselves into small canoe-loads when they meet the Niger at Loko. Kabba only sees, in twos and threes, those humble traders who are carrying native-made cloths from Ilorin to Lokoja, or returning from Lokoja with loads of potash; in fact, the little place just sits here, a tiny, mouse-coloured town, snugly tucked away on the slopes of a thickly wooded hillside in one of the very quietest backwaters of all the world's rushing and scurrying tide.

So much for what Kabba is *not;* now for what it *is*, and what it can present to the eyes of a mere idler: one who loves beauty in all its varied forms, and whose inestimable good fortune it is to have leisure and opportunity to see it every day, and all around, unhampered by any considerations more weighty than the shining of the sun and the working order of a stylographic pen.

Picture to yourself a green, a truly emerald green plain, holding an area of, roughly, ten square miles, freely dotted with palm-trees (*Elæis guineensis*), their tall, slender stems crowned with crests of graceful drooping plumes, and bearing a respectable fortune in the palm-oil contained in the closely clustering bunches of nuts on each tree. Hundreds of acres are under cultivation, mainly yams, cotton, and capsicums, the last-named glowing like little tongues of flame among the glossy, winding trails of the yams—which, by the way, closely resemble smilax on a magnificent scale. Away beyond rise the blue hills in a huge circle all round, jealously shutting in this little green paradise from the tiresome world of restless white folks, who would take count of time, make roads, try to introduce sanitation, and otherwise employ themselves in fruitless and unnecessary works, to the dire discomfort of peaceful denizens of peaceful places.

The ancient city wall stretches away across the plain, enclosing an area of which Kabba Town to-day occupies, possibly, one-hundredth part; a second inner boundary wall surrounds the town proper, excluding the steep little hill half a mile away, crowned by the fort, which is now in as bad a state of repair as the aged walls themselves, but is nevertheless the abiding-place of the military detachment and a handful of native police—in fact, the English Quarter of Kabba, whence may be heard any morning ringing words of command in English, bugle-calls all day long, and at evening-time the native sentry challenging all and sundry with 'Hollwhogothaire?' in his most awe-inspiring tone.

I think, perhaps, this English Quarter is the only aspect of Kabba that has power to damp my overflowing spirits, and to remind me that even in dearly loved Africa 'it is not always May.' Our quarters are a rambling, ill-constructed clay-building, measuring some sixty feet from end to end; the crumbling mud-walls and ant-eaten, collapsing wooden supports surmounted by a painfully inadequate thatched roof. The house was designed by an Englishman whose desire for spaciousness and magnificence of proportion evidently outweighed his knowledge of elementary architecture and blinded his foresight. How the native labourers must have smiled and patiently shrugged their mahogany shoulders as they piled up the ridiculous structure under his imperious orders!

Meantime, the tornadoes sweep up over the hills to the south and west, tearing like a white wall across the plain, and wreaking their fury on this ill-fated hill-top in a most thorough-going fashion. At such times it makes one giddy to look up at the roof while it creaks and sways horribly in the hurricane, each gust seeming to bring the inevitable collapse nearer. We have spent rainy seasons before in Africa, so we take no needless risks, and in the places most essential for our comfort we have rigged up tents and ground-sheets, thus securing to ourselves and a percentage of our possessions islands of comparative safety and dryness; but, for the rest——

At this moment the Resident is manfully getting through his day's work, interviewing the chiefs and headmen of various neighbouring villages, with the rain pouring through the roof, and an umbrella held over his head; while his guests squat around him, placidly enduring the ceaseless streams of water pattering on their persons, and doubtless questioning slowly in their own minds why the 'White Judges' live month in, month out, in a leaking ruin which *they* would not inhabit for half-an-hour before it was made watertight; and, when one comes to think of it, one rather wonders too.

Kabba itself is much the same in appearance as any of the smaller towns in the Protectorate: a collection of clay-built, thatched houses clustered closely together, seeming to cling affectionately to the rocky hillside above—the Ju-Ju Hill, deeply reverenced, dearly loved, and jealously guarded by all. But of the Ju-Ju Hill and its mysterious ceremonies I shall have more to say presently. There is the usual crowded market, with low, dark booths or shelters lining the streets, where the ladies of

commercial pursuits display the invariable collection of coloured cotton cloths, beads, miscellaneous food-stuffs, spices, and capsicums; heads are popped out and white teeth flash into smiles to call merry greetings to the 'white woman,' and to vociferate warnings to the fat, little brown toddlers rapt in wonder and straying perilously near her horse's feet. But when the busy market and humming village are left behind, and the Mohammedan praying-enclosure beside the great *kuka*-tree (baobab) is passed, then it is that I come into *my* kingdom.

I have a lane here—*such* a lane. It extends for a mile or two in the forest belt, and is hardly three feet wide anywhere. Phyllis and Corydon, the necessary accompaniment to any self-respecting lane, would find the greatest difficulty in strolling hand in hand, in the orthodox fashion, except by dint of much squeezing; but it is just possible that Phyllis and Corydon might not utterly condemn my lane on that account. At all events, there is barely room for me and my pony. On either side rises a wall of greenery full of climbing plants innumerable; hanging from the branches of great trees, twenty or thirty feet above my head, themselves loaded with ferns and parasites, are gracefully twining creepers, swaying tantalisingly and rather contemptuously just out of reach of my farthest stretch. Rather contemptuous, too, is the *Ough, ough* of the dog-faced monkeys invisible behind the green curtain; but I have so many friends in my line that I can afford to submit to an occasional snub. Two months ago it was a flaming mass of glorious scarlet *Mussænda elegans;* now that has passed, and the mode for July is a flower I dearly love, but which, owing to a mournful ignorance of botany, I am unable to name definitely. I think it would strike the lay mind as a species of mimosa. The stem is thorny; the leaves, which are minutely pinnate, close modestly at sunset; the flower—bless it!—smells of a thousand sweet things, and consists really of a collection of tiny florets massed together, forming one infinitely delicate ball of slender silvery-white threads tipped with golden pollen. It is everywhere, clasping the tree-trunks, foaming over the bushes, and shrouding the deep, cool recesses where the shining dark ferns lie hidden away, scenting the whole air, and proving itself an irresistible fascination to the butterflies—busy gossips that they are—flashing purple and velvety black, tender yellow and palest blue.

One of the huge *kuka*-trees is clothed for a height of fifteen or twenty feet in a gorgeous mantle of *Gloriosa superba*, each vivid green leaf ending in a long tendril which clings desperately to all it meets. The blossoms when first opened are of a delicate pale-golden colour, daily developing crimson splashes at the base of each petal, and later becoming entirely an exquisite deep-apricot shade, a perfect feast of daintily varying hues.

Out into the open country again; for it must be admitted that my kingdom is not a vast one, though very, very perfect of its kind, and, best of all, absolutely my own—at least, so far, no one has attempted to dispute its possession with me. Skirting the aged wall, one follows a narrow footpath towards a rocky eminence a quarter of a mile away, and, dismounting, explores it on foot. It is a tiny hill of great steepness, composed for the most part of piles of massive boulders, from which nearly all the soil has been washed away by many rainy seasons. An almost invisible track guides one up the precipitous side to the summit, an area of possibly fifty feet square, occupied entirely by huge rocks, shady niches, and coarse creepers.

The place has a history and reputation of its own. It is called 'The Lookout Hill,' and was greatly used—so runs the tradition—in the times of Fulani slave-raiding excursions from Bida. Once you arrive at the top, the *raison d'être* of the name is readily grasped. Far and wide, in all directions, one can view the surrounding country and command every road leading to Kabba, from north, south, and east, without being visible from below. How vividly one can picture the anxious watcher, crouching motionless among the rocks, scanning with straining eyes the path winding like a white ribbon among the peaceful yam-fields and waving grass, on the alert to detect the first signs of the advancing Fulah army; and then flying breathless along the scented forest-ways back to the town, his poor heart thumping on his ribs, to carry the dread news that sounds the knell of slavery for himself, his wives, and children! It is a piteous picture, and gladly one takes heart again, and feels thankful that to-day the scene is so peaceful and so fair.

The Kabba folk are of the Bunu tribe; whence their origin I cannot say. They, at all events, speak a remarkably unpronounceable language of their own, to the utter confounding of any unfortunate interpreter who does not happen to have been born within fifty miles of the place. Bunu is not precisely musical; but I have observed with mild astonishment that these natives rather enjoy talking it. My friend the Balogun likes to chat easily with his retinue in this tongue, which appears to have no vowels except odd sounds evolved from somewhere in the region of the collar-bones, and which seems to demand some special development about the nose and chest, just as Yoruba and Kru require peculiarly-shaped mouths for their correct enunciation. I think the Balogun likes to feel that he is getting level with the white man in a small way by this exhibition of jaw-breaking phraseology. He is a man of property, and, as befits the 'second chief,' is a leader of society in Kabba, dressing recklessly in a gorgeous black-and-white velvet robe; he knows, too, what is due to a lady, even an English one. Once, when I displayed to him some embroidery, he rose manfully to the occasion, and, trotting out his one English idiom, rather startled me by ejaculating pleasantly, 'My God!'

Fetich has a firm hold in Kabba, but to which 'school' the inhabitants belong I have never been able, or indeed tried, to find out, as I have some

belief in treating any man's religion with as much reverence and reticence as he does himself. Before describing the little I do know of Bunu ceremonies, I should like to repeat here Mary Kingsley's admirable definition of fetich: 'the religion of the natives of the western coast of Africa, where they have not been influenced either by Christianity or Mohammedanism;' not rank heathenism, mark you. However, fetich is so well and exhaustively treated both by Miss Kingsley and Major Mockler-Ferryman in their respective works on West Africa that it would be indeed futile for me to attempt to stumble and halt over the ground which they have covered so royally and completely; therefore I will content myself with describing the Bunu funeral-custom, as carried out in Kabba, which I do not think I have read or heard of elsewhere.

The corpse is kept in the house for three days, while four maidens of tender years are selected, and, being placed in strictest seclusion in a house set apart, are not permitted to speak a single word during these days. When the lying-in-state is accomplished, a great number of people from the neighbouring villages arrive, in obedience to the Sariki's summons, not necessarily out of friendship for the dead man, but merely as a matter of religious ceremonial. Each guest brings a certain proportion of gifts in cloth, food-stuffs, or cowries, especially the last-named. The whole party having assembled, they start forth for the Ju-Ju Hill, the corpse borne in the midst, drums beating, horns hooting, women wailing, and general excitement prevailing. The grave has been previously dug in a chosen spot on the hillside (which is practically one large and overcrowded cemetery) in a curious shape. After the ordinary grave has been prepared to a depth of four feet or thereabouts, a tunnel is dug at one end of it, and continued into the earth for a distance of about twelve feet, the passage being wide enough to admit a man creeping on hands and knees.

The party at the foot of the hill seat themselves in a wide circle; and the four silent girls, coming forward and raising the body, bear it away up the hill. It is lowered by them into the grave, and carefully pushed up the tunnel, the idea being to prevent any earth from falling on it. Then returning in solemn silence, they collect the various offerings of food, cloth, and cowries from the assemblage, and deposit them beside and around the corpse; finally, the outer grave is filled in. I have been told that several pounds' worth of cowries are thus buried at each funeral. Meantime, the folks below are holding high revel, dancing, singing, capering, banging tom-toms, and shouting a most enthusiastic send-off to their departed fellow-countryman; while he, good man, sleeps all unconscious of the fun he is missing, lying just where he would choose to lie, on his beloved Ju-Ju Hill. Is it very different from an Irish 'wake,' and is it really much more 'heathenish'?

There are also minor ceremonies and festivals connected with matters agricultural—the ultimate success of the crops, the coming in of the new yams, &c.—without very much variety in the proceedings, the main point being apparently the making of a 'cheerful noise' and the sacrifice of nothing more dreadful than a few fowls. Perhaps some day not far distant, when the green plains of Kabba are all one luxuriant carpet of cotton plantations, pale golden flowers, and snowy bursting pods, there will be initiated a new festival to celebrate the gathering in of the white man's cotton.

BIDDY.

By J. J. Bell, Author of *Wee Macgreegor*.

PART I.

MISS POLLY PELLICOE was what is charitably termed no longer young, but she would have been the last to challenge the statement or even resent it.

'Forty-two *is* my age, and I don't care who knows it,' she said cheerfully, as the collector of the last census papers ran his eye over the document relating to her little household. 'Forty-two, young man; and if I look it, I don't feel it.'

As a matter of fact, she did *not* look it, even in broad daylight; and the Professor, who had recently taken up his abode in the next cottage, judged her to be not more than thirty-five, and, being himself still on the right side of fifty and a bachelor, deemed her dangerous. Single ladies of her age, he had always maintained, were too frequently given to snapping up single gentlemen of his own, and accordingly he had, since his arrival, behaved towards his neighbour with the utmost discretion, though with all due politeness and deference.

'So long as I confine myself to commonplace remarks I am safe enough,' he told himself, forgetting, or perhaps being ignorant of, the fact that the very language of love is chiefly composed of commonplace remarks. 'I'm not going to allow myself to be snapped up like my poor old friend Ludington, who let his tongue run away with him out of sheer good nature, and married a female because she happened to live next door to him. He says he's happy now; but his work has gone to the dogs since she came to live with him. Poor old Ludington! A rare scholar, but a man of no discretion or wisdom when he was outside his library. But *I'll* take care! I've come here to complete a book—not a love-story.'

Now, it must not be supposed that the Professor was a conceited man. He had simply got into his

head the unoriginal idea that maiden ladies were like anglers, while bachelors were like fish, and that the oftener the latter opened their mouths the greater was their risk of being caught. Richard Cardigan was really as modest a man as ever wore spectacles and taught higher mathematics; and although he had fears of being snapped up, as he put it, he would as soon have dreamed of a woman falling in love with him as—well, of himself falling in love with a woman.

He had rented the cottage at Hazeldene for six months, and in its pleasant seclusion he hoped to bring to completion the treatise, ponderous in more senses than one, upon which he had been engaged for nearly fifteen years.

At first Miss Pellicoe took but little interest in her neighbour beyond finding out who he was, whence he had come, and what he did. Having spoken with him once, she decided that he was a 'nice' man, to which decision she added a faint regret that, sartorially at least, he had a somewhat neglected appearance. She herself was the embodiment of daintiness, and anything tending to slovenliness annoyed her. She made up her mind that the Professor's housekeeper was not by any means a capable person, and that in all probability the Professor was quite content to let things jog along anyhow.

PART II.

IT was a hot afternoon towards the middle of June, and the Professor, finding the atmosphere of his study oppressive, had brought his work with him to the front garden. A deck-chair placed in the shade of a tree accommodated his by no means portly form; by his side stood a small table bearing a pint of light Rhine wine, a green squat bottle of seltzer, and a tumbler; also a sheaf of closely written papers and a bulky volume from which the title, through much handling, had disappeared, but which a mathematician would probably have recognised as one of logarithms. For nearly an hour the Professor had been plying his fountain-pen on the writing-pad resting upon his knee, halting occasionally to consult the bulky volume, and it was with a sigh of satisfaction that he pocketed his pen and turned to the refreshment at his side. Having filled the tumbler with hock and seltzer, he took a long pull at the mixture and lay back in his chair, murmuring, 'This is exceedingly pleasant; but I must not allow myself to fall asleep. Let me see if I can't work out that curve without putting it on paper.' He set down his glass, drew his soft felt hat over his brows, and closed his eyes.

It is impossible to state whether or not the Professor solved the problem he had set himself. Perhaps he was just in the middle of it—he was certainly very deeply engrossed in something—when a sudden shrill cry, not far away, caused him to start up violently.

'Good gracious! what was that?' he gasped, looking about him. 'Sounded like a child.'

The cry came again. 'Man! man! Me tuck! Me tuck!'

The Professor rose, feeling that it was himself who was being addressed, and discovered that the cry proceeded from a child who had crawled halfway through a hole in the lower part of the hedge dividing his garden from his neighbour's.

'Me tuck!' repeated the child, catching his eye and smiling.

'Tuck?' queried the Professor, advancing.

'Tuck! Tuck!'

'What does that mean?' thought Cardigan. 'Ah! You—you're pretending you're a fowl—a hen,' he said pleasantly, if awkwardly.

'Not fowl hen!' the little girl cried, with great indignation. 'Me tuck!' And she wriggled in a way that explained better than her words had done.

'Oh, I see!' said the Professor, feeling rather foolish. 'You're *stuck*? You can't get through? Is that it?'

The child nodded. 'Can't get froo.'

'Well, you had better go back, hadn't you?' he said politely.

'Not goin' back. Comin' to see you, funny ole gempleman. Pull me froo!'

'Well, I'm blest!' muttered the Professor, taken aback.

'Pull me froo!'

'But—but'——

'*Pull me froo-oo-oo!*'

There was no resisting the command. Cardigan went down on his knees, and without much delay or difficulty extricated his uninvited guest.

'Fank you,' she said on finding herself on her feet. 'Nice man. Clean me now,' she added, indicating the soil, which fortunately was dry, on her brief garments and naked limbs. 'Clean me wif you's hanky.'

The Professor produced his handkerchief, and as he dusted her down he inquired her name, understanding such an inquiry to be the correct one in the circumstances.

'Biddy,' she replied. 'What's you's name?'

'Richard Cardigan.'

She looked puzzled, and he repeated it.

'Not likin' you's name,' she remarked at last.

'I was called Dick when I was a little boy,' said the Professor meekly.

'Dick? Likin' Dick.'

'Thank you, Biddy,' he returned, smiling; and the Professor looked very nice when he smiled.

'Likin' to sit down,' said Biddy abruptly, taking his hand and leading him to the chair under the tree. 'Sit on you's knee, Dick.'

He seated himself, and in a bashful fashion lifted her on to his knee.

The glass on the table attracted her attention at once. 'You's drinkin' jumpy water,' she cried, pointing to the sparkling hock-and-seltzer. 'Likin' jumpy water,' she added, stretching forth her small, chubby hand.

'I'm afraid, Biddy,' said the Professor politely,

'you are too young to be allowed to drink even the mildest alcoholic beverage.'

Biddy stared. 'Likin' jumpy water,' she repeated a trifle querulously.

'But—but it isn't—er—good for a—ahem!—a little girl like you. Do you understand, my dear?' He blushed as he uttered the tender expression.

'Likin' jumpy water. Give Biddy jumpy water.'

Cardigan shook his head. 'I—I really couldn't think of such a thing. Are you—er—making—a long visit next door?' he stammered, hoping to change the subject. 'I mean to say, are you—— Oh, *please* don't cry!'

For Miss Biddy had shut her eyes, puckered her face, opened her mouth, and was giving vent to a prolonged and piercing wail.

'For heaven's sake, child!'—— he began.

'Likin' jumpy water,' she sobbed, without, however, shedding a tear.

'I say,' he said at last, struck by a happy thought, 'would you like to come to my house and see if we can find some—er—jumpy water suitable for—er—juvenile consumption? Lemonade, you know.'

'Ess!' she cried promptly, slipping from his knee. 'Come on, Dick!' This with a dazzling smile.

The Professor inwardly hoped 'to goodness' that there was some lemonade or other non-alcoholic beverage in the house. If not, he thought, he would send his housekeeper to the village. He could not risk that piercing wail again.

Biddy caught his hand, and was toddling off with him, as if he were in her charge, when a voice was heard calling anxiously from the other side of the hedge, 'Biddy, Biddy! where are you, dear?'

Cardigan halted. 'Who's that calling you, Biddy?' he asked.

'Auntie Polly. Come on an' hide, Dick.'

But just then Miss Pellicoe looked over the hedge and discovered the twain.

'Oh Biddy, what *are* you doing?' she exclaimed involuntarily.

'Goin' to get jumpy water wif Dick,' the child replied calmly.

The Professor looked foolish. 'I think we should—er—postpone the jumpy water in the meantime, my dear,' he said, and made to conduct her towards the hedge.

But Biddy's eyes closed, her face puckered, her mouth opened, and——

'If you please, madam,' said Cardigan hurriedly, bowing to Miss Pellicoe and growing very red in the face, 'may I not take her to the house to see if my housekeeper has a drop of lemonade? I—ahem!—shall not detain her long.'

The lady could scarcely keep from smiling at her neighbour's obvious embarrassment, but she contrived to answer pleasantly, 'It is very kind of you, sir; but I cannot allow Biddy to trouble you.—Biddy, come to me at once. How did you get into Professor Cardigan's garden?'

Cardigan explained, while the child looked from the one to the other.

'I'll get the hole filled up at once,' said Miss Pellicoe. 'I must apologise for Biddy and myself,' she added.—'Now, Biddy dear, you must come to me.—Perhaps, sir, you would be good enough to take her to the gate, where I can meet her.'

'Certainly, madam,' said the Professor feebly, not daring to look down at Biddy.

That young damsel, however, had no intention of being so disposed of.

'Go 'way, Auntie Polly!' she commanded.—'Come on, Dick!' and she tugged impatiently at his finger.

'Oh Biddy!' exclaimed Miss Pellicoe in a tone of reproach, 'you must not be so naughty. Professor Cardigan does not like little girls who are disobedient.'

Biddy tightened her grip on his finger and looked up in his face. 'You not likin' me?' she inquired sweetly. 'Fink I'm likin' you,' she added. 'Likin' jumpy water too.'

Cardigan succumbed.

'If you will allow her to come with me,' he ventured to say to Miss Pellicoe, 'I'll bring her round to you in a few minutes. It would be a great favour to myself, madam.'

The lady hesitated, but at last she smiled. 'Well, I'm afraid it's wrong to let Biddy have her own way, and she must not be allowed to trouble you again. Please do not allow her to have more than a mere sip of lemonade.'

'I'll be most careful,' returned the Professor. He appeared as if he were about to say more; but instead he raised his hat abruptly and turned away with his small charge, who, having gained her point, skipped gaily by his side and prattled gleefully until the cottage was reached, when, to Cardigan's intense relief, it was found that a bottle of the desired beverage was available.

Thus Biddy made the Professor's acquaintance; and during the following two months scarcely a fine day passed without her paying him a visit. It is true that Miss Pellicoe had, according to her promise, barricaded the opening in the hedge; but Cardigan, on hearing the child's first exclamation of dismay and indignation, had removed the offending impediments, apologising to his neighbour afterwards for doing so, but at the same time begging her to leave the passage free in future. So that Miss Pellicoe soon ceased to protest when Biddy, tiring of her play in the garden, would announce that she was 'goin' to see Dick'—she refused to call him by any other name—and disappear through the hole in the hedge. As for Cardigan, it is perhaps enough to mention that his garden-table was always laid with refreshment for Biddy as well as for himself, and that, besides the shabby, bulky book of logarithms, it bore sundry volumes of a decidedly gayer and more youthful character, the coloured illustrations of which were further embellished with inky scores and blobs from his fountain-pen that Biddy took much delight in wielding.

In the earlier days of their friendship the Pro-

fessor was sorely ashamed of his inability to tell stories, Biddy being insatiable in that direction, and himself sadly ignorant of juvenile fiction.

Biddy, moreover, liked her stories told in verse and 'wifout the book,' a desire which floored the Professor, until it occurred to him to order a parcel of infantile poetical works from town and con them in the seclusion of his study after his housekeeper had retired for the night. It must have been a sight for the gods—the eminent mathematician sitting into the small hours struggling to commit to memory such gems as:

Pussy cat, Pussy cat,
Where have you been?
I've been to London
To visit the Queen!

or,

Hey, diddle, diddle!
The cat and the fiddle!
The cow jumped over the moon!

Doubtless some of the old rhymes were not unknown to him, although his young life had been mostly harsh and lonely; but as luck would have it, Biddy had a preference for many that were quite unfamiliar to him, and when he stumbled over a word or a line in repeating them he felt like a schoolboy with his lesson ill-prepared. To add to his confusion, she would sometimes observe, 'You 's not sayin' it nice like Auntie Polly, Dick.'

Probably the most trying minutes Cardigan spent were on a certain afternoon when Biddy appeared, followed by five shy little girls of ages varying between three and seven, and after introducing them as 'Wee Violet,' 'Wee Margaret' and so on, insisted on his reciting the whole of 'The Death and Burial of Cock Robin,' from which ordeal he was only rescued by the arrival of Miss Pellicoe, whose brief absence from the youngsters' garden-party had given Biddy the opportunity of 'goin' to see Dick,' and the satisfaction of presenting her little friends to the delightful being of whose stories and 'jumpy water' she had previously told them.

It was on this occasion that the Professor paid his first visit to his neighbour's garden, the invitation being extended to him by Biddy, who threatened to wail if he refused, and seconded by Miss Pellicoe, who was fain to save the harmony of the gathering and not unwilling to show her appreciation of his kindness to her niece. Biddy, he learned, was spending the summer with her aunt, her parents being on a trip in the States. Cardigan drank tea with Miss Pellicoe, and by the time he had finished his second cup he felt more at ease than he had ever imagined possible in the company of a spinster. Biddy, in spite of her aunt's protests, induced him to play with her and her small guests, and he successively filled the parts of many wild and fearsome beasts, ending up by being an elephant, covered with a weighty travelling-rug and fitted with a trunk in the shape of a yard of garden-hose. In the last guise he endured the most intense heat and fatigue, and was honestly grateful when Miss Pellicoe interfered, and, not without difficulty, persuaded the children to join in another game, this time by themselves.

'Dear me! I 'm sure I thought my playing days were over,' said the exhausted Professor as he cast his skin and laid aside his proboscis. 'Biddy has certainly carried me off my feet. I—I really think I must give a party too. Would you—could you—help me, Miss Pellicoe?'

Miss Pellicoe smiled kindly, but demurred.

Cardigan, however, flushed with the unwonted gaiety and excitement of the afternoon, grew bolder, and repeated his request.

After some discussion, Biddy appeared on the scene and promptly settled the question in the Professor's favour, with the result that she and the five little girls were invited to the neighbouring garden for the very next afternoon, weather permitting. The weather did permit, and the Professor's party was such a success that several of the little girls, in spite of Miss Pellicoe's watchful care, required a sound physicking ere they were twelve hours older. Practical Miss Pellicoe was inclined to resentment against her neighbour on account of the 'ridiculous richness' of the fare provided for 'mere infants;' but when she met him the following morning and informed him that Biddy was one of the sufferers, his remorse was so sincere that she forgave him on the spot, and went back to comfort her niece by withdrawing the threat recently administered (along with the senna) to the effect that the Professor's garden was in future forbidden ground.

Towards the end of August Cardigan realised that he was taking more than a simple neighbourly interest in Miss Pellicoe. The truth seized him quite suddenly one night when he was working late over the final chapter of his book, and he dropped his pen and sat bolt upright as if something had startled him.

'At my time of life!' he muttered. 'No, it can't be! It 's Biddy that attracts me. When she goes back to her parents I 'll be myself once more. And then I 'll soon be getting back to my regular work again. Humph! It 's all nonsense! I 'm all right.'

But he did no more work that night, and his sleep was broken.

'Biddy,' he remarked when she was visiting him in the garden the following day—'Biddy, I 'm afraid I 'll be very sorry when you go away.'

'Ess,' Biddy returned equably. 'Fink you 's likin' me, Dick.'

'Very much, my dear,' he almost sighed.

'Likin' Auntie Polly too?' she continued cheerfully. 'Come an' see Auntie Polly now.' She slipped from his knee and pulled at his fingers. 'Come on, Dick!'

Biddy had found the Professor rather dull this afternoon. Although his 'jumpy water' had been as sparkling as usual, his stories had failed to hold her attention, and on several occasions he had stuck in the middle of a rhyme, and after he had actually mixed up 'Goosey Gander' with 'Sing a Song of

Sixpence,' Biddy felt that she would probably find more amusement on the other side of the hedge, and desired his company there.

'Come on, Dick, an' be a wild beast, an' eat me up. Eat up Auntie Polly too.'

Cardigan shook his head. 'Not to-day, Biddy. I've got work to do. I—I'll perhaps come to-morrow.'

'Come on, Dick!'

'No, no. Not to-day, my dear.'

Biddy closed her eyes puckered her face, opened her mouth, and——

'Very well, I'll come,' said the Professor, ashamed of his weakness. 'What sort of beast am I to be to-day?' he inquired as he rose.

'All sorts,' cried Biddy, beaming on him.

Cardigan told himself he was an ass to begin with; but, all the same, he was disappointed, on reaching his neighbour's garden with Biddy on his shoulder, to find that Miss Pellicoe had gone to pay a call, leaving her maid to await the child's return. Nevertheless, he became sundry wild beasts, chiefly and appropriately enough of the species belonging to the tropics.

THE COMMON RAT.

By E. Adrian Woodruffe-Peacock, F.L.S.

S there any one who does not know it? To dwellers in town and country alike rats are a source of terror or loss. I have known them as long as I can remember anything, and although I have diligently studied their ways, have only witnessed their serried and dangerous battalions twice in my life. In April 1872 I walked to the end of the west pier of Granton Harbour, on the Firth of Forth, and was overtaken by a sudden shower—passing rapidly, but heavy while it lasted. On returning at a swinging trot, at the wooden steps from the upper to the lower outer pier I met the rats in vast numbers. They passed me without the slightest signs of fear, as I stood aside, mindful of Archbishop Hatto of Mainz. For the time being they were intent on one thing only: the fresh rain-water lying in little pools on the larger stones of the breakwater. Such a number of vermin could easily have killed and eaten me in a few minutes had they been as eager for food as they were for water. Bell has put it on record (*British Quadrupeds*) how rapidly famished rats worried and picked the bones of a Northumbrian miner who was unwise enough to enter a coal-pit which had not been worked for some time without first supplying the rodents with food.

The Great Fenland traditions also tell of a huge flood drowning out the engine-fires of a steam-pump; and how, when the engineer returned by boat after the flood had partly subsided, he was despatched by the countless starving rats which had escaped from the drain-tanks to the engine-house.

Again, in very hot weather in the summer of 1878, I think, after a very heavy thunderstorm I came on rats in hundreds on a sandy soil drinking at 'a dew pond.' It was the only pool of open water for three-quarters of a mile or more. The time was between nine and ten o'clock in the evening of a brilliant moonlight night. I stood rooted to the spot with amazement and fascination at the sight. The rats were far too busy for fear or retaliation. They came and drank, and returned with much squeaking but hardly any disorder. There were all ages represented in the throng: the huge patriarch, gray and rugged with age, and the one-third-grown youngster; mothers carried their babes, which were too weak to crawl, for a drink and a dip. If my eyes did not deceive me in the moonlight—for the throng was on the other side of the water, ten feet away from me—there were little pink nestlings amongst those which received these maternal ablutions.

A well-known Lincolnshire farmer, long since deceased, used to tell how the post-boy of the coach between Lincoln and Louth told him, as he was travelling one day, to look out for a battalion of rats at a certain spot on the high wold about 6.30 P.M. 'We allus meet them aboot that time. They've no water at home, an' are going to drink at a [dew] pond.' Sure enough, when the coach reached the spot indicated, hundreds of rats were met with, travelling to the water along the turnpike.

I can truly say I remember the rat as long as I remember anything; and as long as memory lasts one or two 'hunts' will stand out as red-letter days of good sport and wild excitement. In the spring of 1868, when corn was worth over seventy shillings a quarter, we surrounded a stack with railway wagon-sheets, and killed one hundred and sixty-two head—only two escaping. It is rare good sport when you are young and active, and the vermin are not inclined to combine and retaliate. Beware if they do, and escape while there is time. If their numbers are sufficient, life is in danger. In any case, a single bite may cause death from blood-poisoning. One never knows in what kind of garbage a rat's teeth have just been, and there lies the danger.

We consider the fox a cunning beast, and truly he is worthy of the title; but for taking in the whole bearings of a position in a second, or for calling for the united efforts of numbers, if they are available and are required, give me an old rat for preference. Here is an instance: A friend once carried a number of London sewer-rats down to his place in Essex to have some sport with his terriers—and they had it. A suitable spot was chosen in the 'undercroft' below the billiard-room. It was a very large, empty cellar,

with only one door for admittance. To enable us to view the fray, it was lighted by two hanging lamps. When the door was safely locked on the inside 'to keep out the women,' the rats were shaken out of the sacks and the sport began. These wise old rats took in the position at once, and the game was fast and furious, but not quite what was expected. There was no possible means of escape till the door was opened, and open it those vermin did. There was a preliminary squeak or two, then the rats which the dogs were not actually worrying dashed up the men's clothes, and were soon on their shoulders. The first pair of incisors that nipped a human ear or throat produced the desired effect. In less than a moment there was a stampede of London's gilded youth for the locked door. A moment later rats, dogs, and men were in the open air. Five rats only had been killed; the rest got away scot-free, and no doubt their descendants inhabit the locality still. Over the language used on that occasion we must draw the veil of decency—it was as profane as it was emphatic. The neighbourhood laughed immoderately; and, if rats do such things, they must have 'cocked a few snooks' at the defeated bipeds and their four-footed companions.

'The rat,' as I was told in my youth, 'is as old-fashioned as any beast that runs.' He, with the weasel, has the honour of leading the aged blind of his own species with sticks, and of knowing when the premises he inhabits are unsafe from decay. From his singular sharpness of senses and quickness of perception, he is the vilest of all vermin from the gamekeeper's point of view. There can be no doubt now that the Asiatic plague is a disease of rats, which is transferred to the human subject by the rat-flea in the first place, and then passed on from man to man by the human-flea. When the plague breaks out amongst them the cunning rodents disperse, and by so doing carry the disease in an ever-widening circle. Some instinct, too, causes them to leave their holes to die, and the fleas, forsaking the cold body at once, find a resting-place for a time on the human person, and by blood-sucking contaminate the patient with the bacillus of the plague. It has long been known that while doctors who had made hundreds of *post-mortems* on people who had died of plague escaped in a wonderful way, those who had been engaged in laying out the dead did not. In the one case the fleas had been removed; in the other they were still present. It has also long been known that personal clothes and bed-coverings often spread the disease; but some people never contract the malady from them. The explanation of this is quite simple. Certain people are very frequently bitten by fleas, while others are never so bitten, although fleas may be jumping all over them.

With all his cunning, the rat under certain circumstances seems singularly deficient in suspecting danger, or perhaps his inquisitiveness for the time being gets the better of his discretion. Some fifteen years ago we were sitting on a groyne at Worthing, studying the action of shore waves in moving beach shingle. As we sat perfectly still, a rat approached from the shore by the side of the groyne. Turning round the post we sat on, he came straight up to our boots. He smelt them, crawled over them, and after apparently making up his mind that they were not good for food, went on his way to the water-line, after fully ten minutes spent in minute investigation. For the next half-hour we watched him feeding on the refuse left at the high-tide mark. As we discovered later broken bivalves, there can be little doubt that molluscs were his chief food that day. This animal was an old one, but had a thin and half-starved look. Rats have been caught by oysters and large fresh-water mussels.

Not so long ago, as far inland as Sheffield, a rat flicked his tail into the partly open jaws of a huge oyster, which at once closed on it like a vice. The rat naturally made for his hole in a shop; but though he could enter, the bivalve was too big to follow. He was found by the owner of the shop next morning, 'head downwards, tugging frantically, but all in vain.' The rat's love of getting everywhere, and having a tail, if not a paw, in everything to discover if it is good for food, at times leads careless individuals into danger.

Like his enemy the weasel, the rat is often killed by the doe rabbit in protecting her young. Unless they attack a warren in fair force, too, rats are not infrequently driven away for a time by the bold stand made by the older bunnies.

The following is the most curious fact I have ever met with about rats, and shows the danger of lucifer-matches. A large store of corn, kept in sacks at a public-house at High Wycombe, was fired not long ago by rats. Fortunately the flames were observed and extinguished at once, and thus the origin of the fire was discovered. A box of matches had been drawn under a wooden floor by rats, which at once gnawed the box and match-heads, and so set fire to the building!

A large buck-rat will measure as much as twenty inches from the nose to the end of the tail, and will scale two and a half pounds. Old potato-clamp rats in the spring-time will rarely beat this length and weight—they are the finest I have ever seen; but anything which exceeds them may be called exceptional, and is worth recording in print.

The rat has many deadly enemies; the polecat, stoat, and weasel being the most bloodthirsty and persistent of them. What chance should such a small creature as the weasel have against so well-provided an antagonist as *Mus decumanus?* Yet every observant naturalist knows that a single weasel will soon empty a large corn-rick of rats, and five minutes in the open is enough to lay the biggest rat dead.

As a rule, rats are not so abundant in a neighbourhood where game is not preserved as where this is strictly the case. The keepers may do their best at homestead, covert, and drain-side; but after the mustelines have been destroyed for years the rat

naturally flourishes. When you have seen rats bolted by scores from stacks or drain-banks by one wee weasel you can appreciate fully how game-preserving destroys the balance of nature.

Probably few countrymen even are aware how prolific rats are where the food-supply is abundant. The rabbit is simply not in it with the rat. A doe has from twelve to eighteen young ones at a birth, and they begin to breed at three months old, I am informed. I cannot, however, state this as a fact I know; but I can say that in mild weather they will breed all the year round if there is a sufficiency of food. The old English black rat, *Mus rattus*, best known to us now by the albino form kept in cages, is a large breeder, but nothing like the brown rat of our stacks, and that is why it has died out before its Eastern invader. The common rat follows the usual law in such cases; and where they increase rapidly colour-varieties are not difficult to find. Melanistic shades of more or less intensity are perhaps the commonest forms. Piebald specimens are not so very rare; but albinos I have never met with or heard of.

Of all our vermin, the rat is the commonest, and so by far the most destructive. In warehouse, mill, farmstead, or game-preserve it is equally 'matter out of place.' It loves eggs, young game, baby rabbits and hares—anything that runs and flies. I might add swims too, for the great destruction of trout-fry is the work of the brown rat, turned water-rat, and not of the vole. It has, however, no insane thirst for blood like the fox or stoat, and rarely kills for the mere sake of killing, as they will whenever they get into 'a warm corner.' The rat comes and comes again, and in the end leaves nothing.

In a closely preserved country, at the end of an average year, the game suffers more from the 'outlying' rats of the lordship than from the foxes and mustelines together. The solitary rats, whether males or females, are the curse of a game-country. They are most difficult to detect; for in the majority of cases their special work is supposed to be done by hedgehog, weasel, or stoat. I have even known it put down to the otter. A blundering trapper may make headway against most vermin, but with the solitary rat he is absolutely useless. No ordinary care or means is of avail against him. He is the most careful of movers, taking his time over every yard of the ground, with all his senses on the alert for any possible danger. Traps and poison have little terror for him, unless they are laid by a master-hand. It is rarely indeed he is shot at sight, so he generally escapes scot-free, and dies in ripe old age. A wet season, such as that of 1903, is peculiarly favourable for the multiplication of rats. By November all outlying rats, excepting the oldest stagers, have been driven into stacks, farmyard buildings, or shelter of some kind, where there is plenty of water. One active keeper killed four hundred in a few days at some stacks by a drain. When he moved his thirty-nine traps the first night, his take was thirty-six killed, and the other three traps were sprung, but had not held.

Though rats have as insatiable a thirst as Falstaff had, like the rest of us they can have too much water. In the Trent valley, where the floods were phenomenal in the autumn of 1903, rats at times have been seen sitting by scores on the hedge-tops above their soaked homes.

I know many modes of destroying them with poison, plaster of Paris, and in other heartless ways. These may be all right for the thoughtless and ignorant, but cannot be used by kind-hearted and humane men. They are also very dangerous; for after steady poisoning of rats, homes become pestilent and uninhabitable. The simplest and most humane ways are as follow: Where the rodents inhabit buildings, feed them in a box with a tunnel to it over a barrel of water, with a tipe or see-saw floor in the middle of the tunnel. Tie the tipe up, and feed the rats till they run in and out as freely as possible. Then set the tipe working. Next morning, if you are lucky, one hundred and fifty drowned rats may be the result. In any case, the vermin left will be so intimidated that for the time not a rat will be about the buildings. When they return, in from nine to twelve months' time, they may be trained to feed in the box again with a view to their further destruction.

The most deadly of all forms of trapping is taking advantage of the rats' love of water and playing along the shallows of a pond. If you have them by hundreds and want to kill them by scores daily, find out their drinking and sporting places. Place ordinary rat-traps, unbaited, just under the water in the shallows about six inches apart. Let the falling plate be covered an eighth of an inch or so. When the rats are caught, the traps turn over and the vermin are drowned with practically no suffering. Drowning is the least painful of all violent deaths for man or beast. It is the one a humane man turns naturally to when he must take life in self-defence.

NIELS RYBERG FINSEN.

DIED SEPTEMBER 1904.

TRUE follower of the lowly Nazarene,
Who walked the earth with such benignant mien
That from His visage, as from healing light,
Death and disease and sickness took their flight;
Like Him who had not where to lay His head,
It was thy lot to toil for daily bread,
Despising fame and riches, caring more
To help mankind than heap up golden ore.
And yet the fame thou sought'st not thou didst gain;
Thy life—a long Gethsemane of pain—
Was all too brief, yet to thy latest breath
Thou fought'st victorious with disease and death;
And, weeping, we would write upon thy grave,
'Others he saved; himself he could not save.'

SIXTH SERIES.

MY HALCYON EDINBURGH DAYS.

IN the driving rain of a wild November night in 1864 I made my first entrance into Edinburgh, my sole companion in the chilly third-class carriage being a sonsie but demure country lassie who had joined the train at Perth, to pay a visit to an 'auntie' resident in the capital. Five years later I left Edinburgh for good, again in company with a lassie, this time a native of the city and my newly wedded wife. The lassie who shared with me the comfort of a large foot-warmer on my first journey, and whose scrappy little sketches of men and things in the great city made the raw Highland laddie sitting opposite to her gape with wonder at her knowledge of the world, I never met again after we parted at the station; while the other one—the one tie that bound me to Edinburgh and its countless vivid associations—lies peacefully sleeping beside our daughter under the willows of a beautiful cemetery on the banks of the placid Schuylkill, above Philadelphia.

I went to Edinburgh as a second year's Arts student, having passed my 'freshman' year at Glasgow under Professors Ramsay and Lushington —'him who bore that weight of learning lightly as a flower.' The thread of my recollections of that winter of 1863-64 at Glasgow is woven of several strands: Ramsay, alert and insistent; his colleague benign but dignified; constant echoes of the American war, and now and again news of the capture or destruction of some daring Clyde-built craft while running the blockade of Charleston; Norman Macleod in the Barony Church, and filling Glasgow himself with his charming personality and winning eloquence, just as Dr Johnson peopled Fleet Street; a splendid stock company in Glover's Theatre-Royal, Dunlop Street, comprising names that have since risen to eminence in the theatrical world. I had not been a month in Glasgow before I took out a season-ticket for the theatre, which I admit was a most reprehensible thing to do in my narrow circumstances; and the evil of it went further than that, for I gradually dropped off in my attendance on the 8 A.M. Latin lessons, a dereliction which had its natural effect on the quality of my certificate at the end of the session; for though I managed to make a good showing at the 11 A.M. session of the class, which saved me from the fate of the uncertificated, I fell far short of realising the fond expectations of my devoted schoolmaster, kindly and urbane Peter Grant—*requiescat in pace!*

I think it must have rained every day and every hour of the day during that winter in Glasgow, and my health, at that time precarious, suffered so noticeably from the constantly moist and unsunned atmosphere that my father at length decided to send me the next year to inhale the balmy east winds of Auld Reekie, as the least of two evils.

To appreciate Edinburgh fully it is necessary for one to be something of an antiquary, and to this I never attained beyond the degree requisite for the proper understanding of general history. Edinburgh is so many things in one—a diamond with many facets; it is, more than any other European city, distinguished by a vicinage

> **Of clear bold hills that curve the very streets,**
> **As if to indicate, midst choicest seats**
> **Of Art, abiding Nature's majesty;**

it is a city whose matchless picturesqueness is one of the commonplaces of the globe-trotter; it is, moreover, the seat of a great and famous university; and, still more, it is a record, written in freestone, of the course of Scottish history from the beginning of the fifteenth century, when the reigns of the Stuart kings began, down to the Edinburgh of the eighteenth century which Burns saw and saluted with such emotion. But the Edinburgh that appeals to me, and for which I had a passion not yet wholly extinct, is a much more modern one—the city of the middle sixties, where my mind first began, under the influences which surrounded me, to unfold to the consciousness of 'The vision of the world, and all the wonders that would be;' where I lived as a sort of romantic pagan, and, nevertheless, worked conscientiously as a student

[*All Rights Reserved.*]

or teacher, in summer as in winter; and where, finally, I passed from burning the midnight oil to rocking the midnight baby.

It was the splendour of the cyclorama presented by the city and its environs—half from art and half from a wondrously diversified nature—rather than its historic or antiquarian associations that caught my boyish fancy. Within the city my favourite and most frequent view was that obtained in the walk along Princes Street. Walking eastward along this street—which I could not but do twice at least a day—I had on my right the grassy steeps of the Castle rock, and then the quaint, dense, sky-serrated mass of the many-storied houses of the Edinburgh of the past, a view varying as it was morning or evening, sunlight or gray weather, and one of which I never tired. Then, if I took but a few steps out of Princes Street by the open way called the Mound, and from that partial elevation stopped to look westward, what a change in the panorama! I was in the very heart of a city, and yet, both near at hand and afar off, behold a sylvan land!—closest of all the softly wooded Corstorphine Hill, and, beside and beyond it, expanses dying to distant beginnings of mountains and a horizon of faint amethyst. And, perennially fresh, on my approaching the city from a particular quarter, was the view which gave me, once for all, the bold, romantic outline of the whole—the high, rock-rounding Castle on one side, the monumental Acropolis of the Calton Hill on the other, the ridgy, spine-like mass of building between, and, behind all, the noble shoulder and peak of Arthur's Seat and the great scarped curve of Salisbury Crags.

When I matriculated at the University as a second year's student (a 'sophomore,' as our American cousins dub the animal), Alexander Smith, the talented author of *A Life-Drama*, and of the charming book *A Summer in Skye*, was the registrar, though I do not remember ever seeing him. My professors during the four years of my attendance—Sellar, Blackie, Kelland, Tait, Campbell Fraser (MacDougal was already dead), Masson, Playfair, Goodsir—have all vanished from their chairs, and all but one from life; and how much I revered and loved 'the old familiar faces' there is no power in my poor words to express. The medical faculty was especially strong, and splendidly maintained the old reputation of the Edinburgh school, with such well-known names as Playfair and Goodsir, already mentioned (with Turner coming to the front as a brilliant and lucid demonstrator); Simpson, Syme, Christison, Balfour, Lister. I attended all the Arts classes in the regular curriculum, and two of the medical; and speaking for myself, I received more, in the strict line of my studies, from Professors Playfair, Sellar, Masson, and Fraser than from the others. Sellar's fine, courteous bearing to his students, and his patient, conscientious method of conducting the work of his class, made him the ideal instructor, and won me from the first; and in this respect he offered a striking contrast to Professor Blackie, whose rather boisterous manner as we entered his class-room from Sellar's, at 11 A.M., did not at first prepossess me in his favour. But I soon got to like Professor Blackie—as who, indeed, that knew him did not?—for his varied gifts, his inexhaustible versatility of energy, and the manly independence of his opinions, which he freely expressed to us on every topic of the day in that abrupt, trenchant style of his which went straight to the core of his subject. The *Pericles* of Plutarch and the *Clouds* of Aristophanes, which at least *some* of the class were reading, but supplied him with texts from which, with head thrown back and flowing mane, he commented pithily and with fanciful exuberance of quotation on whatever subject came uppermost in his thoughts.

Perhaps it was in Professor Fraser's class of Logic and Metaphysics that one could find the youthful Scots intellect disporting itself, as in a congenial element, with the greatest vigour and freedom. Some of the short essays read weekly in that class-room, crowded with embryo clergymen, lawyers, and doctors, were of first-rate quality; and when the Professor himself was pleased to give us of his best, the close of his brief but brilliant effort was marked by such a storm of pedestrian applause as could not be matched in any other part of the University.

On the whole, however, I feel most indebted to Professor Lyon Playfair's lectures and experiments in chemistry, for they opened up a new kind of world to me which 'redressed the balance of the old' world of mere words and speculations. I have always thought that but a small part of what is properly education has been given in schools and colleges. Many woeful experiences with the by no means extinct class of college students who 'gang in stirks and come oot asses'—simply because the apparently unalterable custom of making a mechanical manipulation of a certain amount of Latin and Greek the basis of the preparatory training enables a boy who is not a positive dunce to get into college—have convinced me that if the calibre of these same stirks were tested by a thorough preliminary course in higher English studies and in the elements of general science, there never would be any danger of the metamorphosis occurring; these mistaken lads would remain honest stirks to the end of the chapter, browsing in the fields which mother Nature had marked out for them.

Of course the study of English has nowadays a more prominent part in secondary education; but there is still large room for improvement. Suppose a boy educated on the classical system leaves school at the age of sixteen, or college at the end of his first or second session—a thing of frequent occurrence—what remains to him of his so-called education? This is the reason why one meets with so many persons in decent circumstances, persons who have passed several years at school, if not also some time at college, going through life without any intellectual tastes, falling victims with barbarian simplicity to

every tinsel allurement of style, entirely outside the influence of living genius, and scarcely aware, even as an historical fact, that they are the countrymen of Milton, Bacon, and Shakespeare. Their study of the Greek or Latin grammar or classic taught them something valuable, if you will; but one thing it did not do—it did not give them the key to literature or open to them the world of books; it did not put them into the possession of that inheritance which has been provided for every Briton by the labours of the philosophers, poets, and wits of three centuries.

I myself missed many of the advantages offered by Edinburgh to a student who is under good guidance. I had always been, by implication if not directly, taught to look askance at science, for instance, and to look up to ministers and professors—in other words, to theology and ancient literature—as the highest good. I never attended a lecture at the Philosophical Institution; of the science even of that day I was so ignorant that I was barely able to follow the lectures of Professor Tait on Natural Philosophy; and it was mainly the teaching I received under Professor Playfair that in after-years, when I had cut my wisdom-teeth in a foreign land, influenced me to discard the husks of the dreary and unprofitable classicism of my boyhood, and take up studies whose results, insignificant though they be in my own case, are nevertheless an abiding and satisfying possession.

To Edinburgh and Professor Playfair and his assistant, then, I owe my first impulse towards science and the method of science in other spheres of thought and research. To a little knot of men living in Cambridge, Massachusetts, in the years 1875–80 I am indebted for familiarising me with the work done by Faraday, Darwin, Huxley, Tyndall, and Spencer, and the long array of scientific investigators behind them. Those few cultured Americans, then clustered round Harvard College, with Longfellow, James Russell Lowell, and Oliver Wendell Holmes representing among them the modern spirit in literature, first truly taught me to regard the intellect as the most precious gift with which God has endowed man, the patient, earnest, impartial search after truth as the highest act of worship with which they can adore their Creator.

Professor Blackie's outlook upon human life might have been formulated by the well-known line of Terence: '*Nihil humanum a me alienum puto*' ('Everything that concerns my fellow-men is of interest to me).' Whether glorifying the Gaelic language, fresh from his holiday in the Scottish Highlands, or criticising the performance of the latest theatrical star in *Hamlet* or *Macbeth*, he was equally in his element. It must have been soon after listening to the crooning of some wild Highland lament that he declared one day in the class-room, in his usual abrupt but only apparently irrelevant manner, that of all the writings of Wordsworth the only lines that moved him, by their weird force and suggestiveness, were the following from his poem on the Highland girl singing in the reaping-field:

> Will no one tell me what she sings?
> Perhaps the plaintive numbers flow
> For old, unhappy far-off things,
> And battles long ago.

That was one of Blackie's grand points: while making believe to depreciate an author, he put his casual remarks about him in such a way that the more curious, at least, of his audience were incited to go straightway and read the author for themselves, as doubtless he often induced others of his students to learn the German language by his frequent laudation of it and his striking quotations from German literature. His manly and straightforward attitude in regard to the theatre was one of the ties that bound me to him in spirit, and which still endears him to my memory, irrespective of his professional relation to me, and this not so much because I loved the theatre myself, but because his fearless advocacy of an elevated stage marked him out for me as one of the elect who look at the things around him with a single eye.

During my second year in Edinburgh it was my good fortune to become acquainted with Mr and Mrs Wyndham, the lessees of the Theatre-Royal; and my subsequent intercourse with them and some of the pleasant people I met at their house is one of my brightest reminiscences of the ever-romantic city. Mr Wyndham himself was an easy-going, debonair sort of manager, and the greater part of the active work of 'running' the theatre devolved upon his able and energetic wife and her brother, who filled the double position of stage-manager and leading light comedian. Old Edinburgh theatre-goers need not be reminded of Mrs Wyndham's striking impersonation of Lady Macbeth and Helen Macgregor, or of Mr Wyndham's inimitably airy and delicately shaded Mercutio; neither will they have forgotten Powrie in *Rob Roy*, Boucicault in the *Colleen Bawn*, or Talbot, the popular tragedian who figured so often and so acceptably in Shakespearian leading parts, with the late J. B. Howard acting as Horatio, Macduff, and Richmond to his title-rôles. I attended several rehearsals conducted by the spirited manageress, and it was a scene to be long remembered to watch her superintending the mounting of such a play as *Macbeth*, with Locke's music; from the 'star' himself down to the greenest 'super,' from the witches (male) on the moor to the musicians in the orchestra, all fell unresistingly under the force of a sway whose tension never slackened till the controlling spirit of it was fully satisfied. Mrs Wyndham was extremely painstaking in teaching the younger members of her company to read their lines clearly and with the proper emphasis. I was once present while she was drilling a young clerk from the War Office turned actor (named Anson), for a long half-hour, in rendering five or six important lines in the way she wanted, and that was a way polished to the very finger-nails.

One rather foggy evening, feeling tired of poring over my books, I sallied forth from my lodging and strolled in the direction of the Post-Office. Arrived there, I encountered a crowd of people in great commotion pressing down Leith Street, and I soon made out that the magnet which drew them down that already thronged thoroughfare was the Theatre-Royal on fire. 'What a blessing it happened before the performance began!' was the exclamation heard on every side. But I need not detail the circumstances of the exciting event. Very soon a detachment of troops from the Castle garrison joined the police to form a cordon round the blazing structure as a bulwark against the pressure of the serried throng of spectators who were hampering the work of the firemen. Next morning the theatre was a smoking ruin, and it was known that several lives had been lost in the conflagration, notably that of a Mr Lorimer, one of the city notables, who had risked his life to save property from the adjoining Catholic church, and who was afterwards honoured with a public funeral on a large scale.

On the following Sunday I went to hear the Rev. Dr Gray of Lady Yester's Church, who took for his text that morning the passage in which the Saviour chides His followers for their rash judgments: 'Think ye that they upon whom the tower of Siloam fell were more sinful than the others?' The sermon was a pointed deprecation of the illiberality displayed by many of his fellow-citizens in their comments on the calamity of the previous week. I had always admired this minister for his scholarly and broad-minded discourses; but this particular one was a scathing arraignment of the pharisaical intolerance from which certain circles even in Edinburgh were not free in that day.

The Edinburgh pulpit was then a brilliant and commanding one, yet I missed hearing several of its most able divines. For instance, I never entered St John's Episcopal Church, and the humane and patriotic Dean Ramsay's *Reminiscences* I never made acquaintance with until it was put into my hands, years afterwards, by one of its many admirers in the United States. And the pity of it! I never heard honest and kindly old Thomas Guthrie; an omission, however, for which I was not altogether to blame, for he was then living in retirement, preaching but occasionally in his former church, whose pulpit was now filled by the accomplished Dr Hanna. So far as I can recall them, Dr Hanna's beautiful sermons were pitched in the tone of St John's Gospel, but they were apt to pall by their monotonous sweetness. The redoubtable Dr Candlish ('the pope of the Free Church' I heard him once called) was a preacher of a very different strain; and, so far as logical precision of thought and closeness of reasoning went, he was perhaps the most powerful pulpit orator in Edinburgh at that time.

But of all the Free Church ministers whose services I attended from time to time—and I was an indefatigable church-goer—the Rev. William Arnot, the self-educated gardener, whose charming autobiography I read in America, was my prime favourite. His sermons, plain and practical in scope, were yet characterised by a winning grace of style and originality of thought, and illustrated by the most interesting anecdotes and experiences. His very double, in almost every point of resemblance, is living to-day in America: the Rev. Robert Collyer, of the influential Church of the Messiah, New York, who was originally a Yorkshire blacksmith and lay Methodist preacher, and whose simple but beautiful and forcible sermons always, when I heard him, recalled to me the attractive manner of Dr Arnot.

If I were to be asked what minister, in all my experience of the cloth, impressed me as the most powerful and magnetic preacher I had ever heard, unhesitatingly would I answer, the late Henry Ward Beecher, who, at his best, was a John Bright, a Jeremy Taylor, and a George Whitefield rolled into one. The power of his vivid and striking application of the Gospel teaching to every mood or motive that influences the human heart, to every minutest circumstance of the worldling's life, was marvellous and irresistible, and it was reinforced and illuminated by one of the happiest faculties for the coinage of instantaneous photographic picture-phrases that ever mortal was gifted with. To listen to him as he literally *froze*—or, if you prefer it, mesmerised—the gaze and attention of that vast congregation of his was to understand something of the nature of inspiration. The keynote of his teaching was: 'God may forgive you, but Nature never will.'

I revisited Edinburgh from New York for a few weeks in the summer of 1895, after an absence of a quarter of a century. On the morning of my departure I rose at dawn to have one last look at the noble city when none of its inhabitants were on the streets but the policeman on his beat. After rounding the Calton Hill I walked slowly up Princes Street just as the morning twilight was bringing out of shadow the grassy steep of the Castle rock and glinting with faint flashes the myriad windows of the Old Town. Then I passed up the Mound, and turning up the High Street to the Esplanade, from that magnificent station in the high, cool air, just as the sun was rising, gazed northward and all around. What a range of scenery over the whole of the new city and its gardens to the flashing waters of the firth, and still beyond these to the gleaming towns, villages, and heights of the opposite Fifeshire coast! 'Earth has not anything to show more fair!' wrote Wordsworth from his morning standpoint on Westminster Bridge. What would he have written had he stood where I stood and gazed entranced in the still and fragrant air of that, my last, day in Edinburgh? The gray old city, with its heights and hollows and matchless environs, made a picture of silent splendour often afterwards to be recalled for solace and with yearning amid the break-neck materialism of the great transatlantic city for which I set out a few hours later.

GIANT CIRCUMSTANCE.

CHAPTER V.—HOW GEOFF CAME HOME, AND WHAT HE FOUND THERE.

THE finding of the court-martial was, as Mr Devon had foreseen, an adverse one. To what exact length the military sea-lawyers on the Nile had gone in their efforts to prove that no one could possibly be to blame in the matter but Lieutenant Challis, no one ever knew save only the Secretary for War and the Judge-Advocate-General, and of course the members of the court; and these all found it to their advantage to maintain a discreet silence on the subject.

Mr Devon was with the eminent lawyer when he opened the packet, and they read the verdict through together.

'Fools!' said the Judge.

'Idiots!' said the Secretary.

'We'll soon put that right. I shall go through the evidence as a matter of form, though I know the whole story from the correspondents' reports. I shall advise Her Majesty that the finding of the court-martial is against the weight of evidence, and advise that Lieutenant Challis be relieved of all the consequences of the trial, and that he accordingly be released from arrest and ordered to rejoin his regiment for duty.'

'H'm!' said the Secretary dubiously. 'And what would you do under the circumstances, Grantley, if you were Lieutenant Challis?'

'It would depend on the kind of fellow I was. I could imagine myself going back if I were the kind of man I believe he is. But I should expect to have somewhat of a dence of a time of it.'

'It's rough on a young fellow, you know.'

'It's terribly rough. Do you suppose he'd exchange?'

'Not he. He'll go straight back to his duty. If he's back in time for the fighting, he'll fight to the death and probably get killed.'

'How do matters stand now between him and your daughter?'

'H'm! I have hardly seen her since this cropped up. She felt it keenly, of course, and has been keeping to her rooms. I imagine her mother has been talking to her, from words she let drop.'

'That's pretty rough on the young fellow, too. Lady Eugénie objects to the match now, I suppose.'

'I'm afraid so.'

'That will hit him harder than this other thing.'

Devon nodded. 'I'm very sorry about it. I always liked Challis, and Carrick is one of my oldest friends. But the women settle these things nowadays, you know.'

'The women settle far too many things nowadays, and generally do a great deal more harm than good. Three-quarters of the troubles of life come through them.' You see, he was president of the Divorce Court also, and, through painful experience, somewhat of a misogynist in business matters, though otherwise a most courteous gentleman and a pleasant and genial man.

Mr Devon conveyed the Judge-Advocate's decision to General Carrick at once, under pledge of secrecy until Her Majesty's approval should permit of its publication. And there was tempered joy among Geoff's many friends.

Tempered, because, to all, two things were evident: first, that his position at the front could not possibly be anything but a most uncomfortable one under the circumstances; and, second, that from Miss Devon's attitude a further knock-down blow awaited him before he would have time to recover from the other.

As regards the first, matters could be eased for him somewhat if he would consent to an exchange. But they knew beforehand that he would not. His attitude throughout had been consistently that of an innocent man suffering tribulation. It was not to be imagined that he would weaken in the matter for any consideration of personal comfort. He would do what he believed to be the right thing under the circumstances, and nothing would turn him therefrom.

As regards the second, some of them had come to hold that it was a blessing in disguise. For the woman who will desert the man who loved her, in his time of need, is no true comrade for life's rough journeying, and that is one of the things better discovered too soon than too late.

They all went down to Southampton and were on the quay-head awaiting the arrival of the transport *Serpent* one dismal January morning: Ellen, and Doone, and the General, and Colonel Trevor, who had threatened divers pains and penalties if he were not included in the party.

The news of the reversal of the finding of the court-martial had been made public some days before, and there were many there besides themselves waiting to give hearty welcome to the man whom a week or two before they were miscalling and condemning.

It was raining and blowing, and the sea was thrashing sloppily under driving clouds of mist. They sheltered under dripping sheds and chatted discursively, in cheerful discomfort both of mind and body; for, good as their news was in some respects, there was an underlying stratum of doubt and difficulty to which it was impossible for them to close their eyes.

At last the shining oilskins outside showed signs of animation, and the word ran round that the transport was coming. They all streamed out into the wind and wet, and saw the huge black hull nosing slowly up to the dock-side.

Challis's quick eyes found them out before the ship came to a stand, and a glance at their faces told him that all was well, and that his time of anxious suspense was at an end.

In five minutes more, swordless, beltless, and sashless, worn of face, but with eyes that blazed joyfully, he was wringing their hands and many more that were thrust at him from all sides. For, after all, when he gets at the rights of a thing, the Englishman loves to see justice done; and if the under dog succeeds in coming out top his sympathy is apt to run riot.

'All 's well, my boy,' was the General's greeting. 'Her Majesty relieves you of all consequences of the trials, and you are to rejoin as soon as possible.'

'Thank God! That means that no blame attaches. What 's the news from the front?'

'Still advancing, slowly. Not come to grips yet. I've got you a week's leave, so that we can talk things over. Now, let 's get out of this mob and go back to the hotel and have something to eat.'

No objection was made to Geoff's accompanying them. The General had seen to all that. Doone gave his arm to Colonel Trevor to help the deficiencies of his wooden leg, and General Carrick joined them, so that Geoffrey and Ellen might be by themselves.

'You are frightfully thin, Geoff, and as brown as a mummy,' said Ellen.

'And you strike me as frightfully pale, child. I 'm afraid this trouble has hit you.'

'It hit us all. They have treated you shamefully.'

'They certainly might have saved me the long anxiety of the voyage home,' he said quietly. 'It seemed as if it would never end.'

'Will you go back?'

'Of course, dear. I must, and as quick as may be.'

'I hate the thought of your having to go among those men again. It seems to me they did their best to ruin you.'

'Did they? Well, I don't understand it at all, or why they should have done so. I was always on the best of terms with them all.'

'I 'm afraid they thought it a case of their skins or yours, and they thought most of their own.'

'That 's natural, after all. How is Una, Nell?'

She had been waiting for that and fending it off as long as possible.

'She is not well, Geoff.'

'What is it? Nothing serious, I hope?' he asked quickly.

'I don't know what it is. I've not seen her since—since the first news came of your troubles. I 'm afraid she 's been very much upset. I don't know that it 's anything worse than that. She has not been going out at all, and each time I have called she has been confined to her room.'

Geoff walked on without speaking. When Ellen glanced sideways at his face, the tense rigidity of the dry, brown cheeks struck her afresh.

And presently they were at table, the General and Trevor doing their best by exceeding joviality to cover the lack of spontaneity in the rest. For Geoff was visibly depressed in spite of the lifting of his cloud, and Ellen and Doone felt keenly for him in this aftermath of trouble.

They had discussed the matter between themselves many times, and their anger was hot against Una, while still they felt it better, if matters stood as they feared, that Geoff should learn the shallowness of her affection now than later, when the awakening might be bitterer still.

'You have quite made up your mind to return, my boy?' asked the General, by way of diverting him from the matter that was nearer his heart.

'Quite, sir. I shall be glad of a few days with you all. It has been a bit trying lately, and I 'll be hanged if I can understand it all yet. But if I hurry back I may get there in time for the fighting, and that will do me more good than anything else. Once I start I 'll make record time, I promise you.'

'I think you 're right, Challis,' said Colonel Trevor soberly. 'But you 'll not find things altogether easy, you know.'

'They have not been altogether easy of late, sir, and they cannot possibly be worse. If I get back in time they will be very much better. If they have made me miss it with this—this foolishness, I shall—well, I shall be sorry.'

'After the mistake they 've made—to put it mildly—they 're bound to feel some resentment at your coming back, you see, and I've no doubt they 'll show it more or less. I don't know Everett. What kind of a fellow is he?'

'We always got on very well together. I cannot understand what all this business means.'

'Oh, that 's plain enough. They knew the matter was bound to make a sensation at home, and they thought to save their own faces by blackening yours. You were lightning-conductor. Fortunately, Grantley is a man of unusual commonsense, and stands no nonsense where the law is concerned.'

Geoff shook his head in puzzled fashion. 'When all 's said and done, I still don't see why any one should try to fix blame on me, when, as a matter of simple fact, no blame attached anywhere. When the Arabs broke upon us, and Eisenach failed to mount his horse, no earthly power could have saved him. As a matter of fact, if any one is to blame for his death, it is the man who made his holster-strap of rotten leather or faced brown paper. If that had held, he would probably be alive now. At all events, he would have had equal chances with the rest of us.'

'A victim of the unscrupulous greed of a shoddy age,' commented Trevor grimly. 'And thousands of other good fellows have been done to death in similar ways. Shoddy cartridges, shoddy saddlery, shoddy bayonets, shoddy swords. It 's wicked work. May they sometime have their reward! In

this life they wax fat. In the next I hope they'll grill without reprieve.'

'Amen!' said General Carrick fervently.

They went on at once to town, and the journey was not a very lively one. The excitements of the morning had spent themselves, and the second act was drawing nearer with each turn of the wheels. They knew Geoff would stand this blow as he had stood the long-drawn anxiety of the first; but, all the same, their hearts were heavy for him, and they wished it over.

It was late when they got home; and as Geoff had some necessary additions to make to his uniform, he decided to postpone his call on Una till the morrow. They sat long over the fire after dinner, while Geoff told them of his experiences up the Nile, and the General commented caustically on the way things had been done and time and opportunity wasted.

The morning found Challis all the better for a sound night's rest; and as soon as he had made his purchases, and decency permitted of a call, he was at the door of the Devon house.

'Her Ladyship and Miss Devon are at Bournemouth, Mr Challis,' announced the footman, who knew him of old.

'And Mr Devon?'

'He is at the War Office, sir.'

And Geoff betook himself to the gloomy establishment in Pall Mall.

Mr Devon used unparliamentary language under his breath when Challis's card was brought in—not at Geoff, but at his (Devon's) wife, who had cast this additional burden on his shoulders. He received his unwelcome visitor with a warm grip of the hand, however, and a hearty 'Glad to see you looking so well, Challis. Some men would have knocked under with the worry of it all. You don't seem to have suffered much.'

'It depends how one feels inside, sir, I suppose. And I felt all right. I should have felt just the same if they'd shot me.'

'Cursed fools!' jerked the Secretary hotly. 'You should hear Grantley on the subject. He doesn't often let himself go, but he did when he read their idiotic documents.'

'Ah well, that is all past, so we may bury it,' said Geoff quietly. 'Now I'm thinking only of the future.'

'Quite so. I suppose it's no use suggesting the idea of an exchange for you?'

'Not the slightest, sir; thanks all the same! My place is up the Nile, and I'm off in a day or two. Have you any news? They're not likely to clean up before I can get back?'

'I don't think so. The others withdraw as they advance—which is, of course, from their point of view, the proper thing to do. Our lines of communication are getting terribly long and thin, and the commissariat is a constant source of anxiety.'

'Yes, that's the danger. You've rather scrimped us, you know, both in men and material. The consequence is that both are overworked, and the waste is larger than it would have been if you'd been a bit more open-handed.'

At which Mr Devon groaned, 'I know, I know,' and shrugged the responsibility off on to other departments, and waited for Geoff to ask the question he had come to ask.

'And Una?'

Mr Devon shook his head. 'I really don't quite know what to make of Una,' he said thoughtfully. 'I've seen hardly anything of her for the last week or two. She took to her rooms, and refused all invitations, and moped so that her mother thought it best to take her down to the sea for a time. They're down at Bournemouth.'

'So I learned at your house. Nell had not known, I think.'

'It was only yesterday that her mother prevailed on her to go,' said Mr Devon, with a touch of delinquent colour in his tired white face.

Geoff was slightly colourless under his tan also as he asked quietly, 'I suppose you have no objection to my running down to see her, sir?'

'Not at all, my boy. They are at the Mont Doré,' said Mr Devon, jumping with relief at the chance of turning back the responsibility on to his wife's shoulders—where, after all, it rightly lay. 'When will you go?'

'At once, sir. I want to get back to the front at the earliest possible moment. I should regret it all my life if I missed the fighting.'

'Young blood! young blood!' said Mr Devon. 'Shall I see you again before you start?'

'If you wish to, sir. I will let you know before I go, anyway.'

'Well, good-bye, my boy, for the present, and good-luck to you!' And Geoff left him to his permanent worries.

He had great faith in his sister Ellen's good sense, and he went back home to report events and talk things over with her.

Ellen had been awaiting his return with anxiety. She had drawn her own conclusions from Una's conduct, and they were not favourable ones. She was full of concern for Geoff, and her sisterly anxiety and her knowledge of his character led her to fear that the real results would only become apparent when he returned to the front. She looked upon him, indeed, as good as dead already, and she could not keep the feeling entirely out of her manner.

'Lady Eugénie and Una have gone down to Bournemouth,' he said. 'I'm going after them.'

'Gone to Bournemouth? Why, when did they go, Geoff?'

'Yesterday, Mr Devon says.'

'H'm!' said Ellen, and her lips tightened unusually, and her smooth brow crumpled slightly.

She must prepare him for what she feared, but it was not easy. And, then, she might be mis-

judging Una after all. She might really be ill with the anxiety and upsetting.

'You think you really must go, Geoff?'

'Of course,' with a quick look at her; 'I must see Una before I go back.'

'If she is ill, perhaps you won't be able to see her. Then it will only be a further disappointment.'

'Still, you know, I couldn't be at home without calling on her. Now, see here, Nell, speak right out! Is Lady Eugénie trying to come between Una and me? I know by your face you're in trouble about something. What is it?'

'It's just that I'm afraid of, Geoff. You know what Lady Eugénie is. She was never too well pleased about the matter, and it is quite likely she has taken advantage of this affair to work on Una, and done her best to persuade her to—to'——

'Chuck me overboard,' said Geoff grimly, with his face tight and hard again. 'Well, if it is so, I'll see what her ladyship has got to say about it herself, anyway. I can hardly believe it of Una, though, Nell. She has always been so—so'——

'You are worth fifty of her, Geoff,' broke out his sister impetuously. 'And as for Lady Eugénie, I hate her. She would sell her soul—or Mr Devon—for a step up the ladder.'

'Mr Devon said nothing of all this. I've come straight from him.'

Ellen nodded. 'I like Mr Devon, and, if it is as I fear, I have no doubt he is put out about it too. But Lady Eugénie has a will of her own sometimes. She looks quiet enough, but she can be very determined, and I should think very nasty, and I expect she just turns Mr Devon and Una round her finger when she wants to.'

'Well, I'll go down and tackle her, anyway,' said Geoff quietly.

(To be continued.)

SOME POPULAR LEGAL FALLACIES.

By Frank H. Stevens.

IT is not surprising that at the present time, when the business of life has to be transacted at such high pressure, popular fallacies should abound. The information of the average man of to-day is no doubt vast indeed compared with that of his ancestor who lived before the days of a universal press; but the very multiplicity of his interests is in itself inimical to accuracy, and precludes anything but a mere passing acquaintance with subjects beyond the scope of the particular occupation on which his livelihood depends. The result is that knowledge is often merely assumed and terms are used and applied by people without any real comprehension of their meaning; while instances of the power of a catch-phrase to influence and sway the public will occur to every one.

Many are apt to imagine that they know everything which concerns their own affairs, and that any fallacies they may entertain are in connection with matters outside the sphere of daily life. But this is not the least of their errors. It would be interesting to know, for example, what proportion of the business men of the city of London would be able to tell one the true significance of the crossing of a cheque with the words

'NOT NEGOTIABLE.'

It is a very simple phrase, and every man who has a banking account has doubtless often used it. But how many would answer that the meaning of the words was obvious, and that a cheque so crossed could not be negotiated? And yet they would be wrong; for a cheque so crossed is capable of being endorsed by party to party in the same way as any other cheque, and when presented for payment the drawer must meet it. The virtue of the crossing 'Not Negotiable' lies in the fact that no person taking a cheque so crossed can acquire any better title to it than had the person from whom he obtained it. Hence, if a cheque so crossed be stolen, no person into whose hands it may subsequently come, although he may acquire it for value and in the ordinary course of his business, can obtain any better title to it than the thief himself had, which is none at all. The words 'Not Negotiable,' in effect, inform the person to whom the cheque is offered that if he would protect himself he must inquire into the title of all the persons through whose hands it shall have passed since it was in the hands of the drawer; and if he choose to disregard such warning he will do so at his own risk. But if the dealings with the cheque have been all in order, it will be perfectly good in the hands of an endorsee. This crossing, which is recognised and adopted by the Bills of Exchange Act, 1882, by reason of the very fact that it is not universally understood, no doubt serves another useful purpose, for it tends to lessen the time during which a cheque may be outstanding. In the old days and in country districts the squire's cheque was regarded among the small farmers as being as good as—ay, better even than a Bank of England note, and it would be passed from one to the other until, from constant fingering, it almost fell to pieces, the result being that the drawer was never sure what his financial position was, and each successive holder of the cheque on his side ran great risk of losing his money altogether in the event of the failure of the bank on which the cheque was drawn. The

idea of our legislature solemnly authorising the use of certain words, and at the same time declaring that they shall mean something which in the ordinary acceptation of those words they most certainly do not mean, will no doubt strike the layman as being exceedingly comic and as a proof of the truth of Mr Bumble's assertion that 'the law is a ass;' but if the proof of the pudding be in the eating, the adoption of such a course in this case has no doubt been fully justified.

STOPPING A BANK-NOTE.

From time to time we read of bank-notes being 'stopped,' and it is a popular impression that the Bank of England, having been notified not to pay a note that has gone astray, the Bank has no choice but to refuse payment of that note if it should be presented. This is, however, quite an erroneous idea, for such a note is a promise by the Bank to pay to the *bearer* a certain sum *on demand*, a negotiable instrument transferable by mere delivery. The Bank of England has legally no power to refuse payment, and if it had such power it would be a serious thing, for a Bank of England note is legal tender to any amount, and unless it were in fact as good as money it would be impossible to carry on business. But what the Bank will do is to delay as long as possible the payment of the note, thereby giving the loser an opportunity of establishing, if he can, his title to it as against the person presenting it; but if the Bank should refuse to pay a note on demand, and the person presenting it should forthwith issue a writ for the money, the Bank could have no defence to the action.

ARE SUNDAY CONTRACTS VOID?

There is a popular impression that they are, but this impression is only partly correct. From time to time one reads of the prosecution of some tradesman for keeping his shop open on the Sunday, and the infliction when he is convicted of a fine of five shillings for each offence proved. Such prosecutions take place under an old Act of Charles II., whereby it is provided that 'no tradesman, artificer, workman, labourer, or other person whatsoever shall do or exercise any worldly labour, business, or work of their ordinary callings upon the Lord's Day or any part thereof, works of necessity and charity only excepted.' Contracts entered into in contravention of this provision are, of course, void and of no effect; but the Act is not so wide in its operation as one would at first sight imagine, for to constitute an offence it is necessary that the work done be that of the particular man's 'ordinary calling.' So an agreement made on a Sunday between, say, a lawyer and a stockbroker for the sale and purchase of a horse would not be void on the ground that it had been entered into on the Sunday, for it is not part of the ordinary calling of either a lawyer or a stockbroker to buy or sell horses, and if either party wished to get out of his bargain this statute would be of no assistance to him. Again, the class of people affected by this provision is really very limited, because there is a legal rule of construction known as the *ejusdem generis* rule; and applying this rule to the construction of this statute, the Courts have held that the words 'or other person whatsoever,' which in their ordinary meaning would be wide enough to include every one, only refer to people *of the same class* as the 'tradesman, artificer, workman, or labourer' specifically mentioned. This so narrows down the application of the Act that the lawyer and stockbroker in our illustration would in no case be affected even if the words 'of their ordinary calling' had been omitted from the Act, neither being of the tradesman, artificer, workman, or labourer class. So it will be seen that the popular impression that contracts made on a Sunday are void is correct only to a very limited extent.

'TRESPASSERS WILL BE PROSECUTED.'

We are all more or less familiar with this legend, for it is almost impossible to walk for many minutes in any part of the country without coming face to face with what lawyers have aptly termed a 'wooden liar.' One might well conclude from this threat of prosecution that a mere trespass was a crime to be followed by punishment; and it might be with something in the nature of a shock that on walking through another man's field one would find one's self confronted by one of these impostors. As a matter of fact, simply to walk across another man's field is no more a criminal offence than to walk along the high-road. Even the gathering of wild-flowers in another man's field is no punishable offence, for by the common law there can be no theft of things forming part of or attached to the soil, and up to the present Parliament has not interfered to alter this. But taking or doing wilful damage to plants or flowers in a garden or a pleasure-ground, for instance, or taking or doing wilful damage to roots and plants which are *cultivated* for the food of man or beast or for manufacturing purposes, although these be in the field, stands on a different footing, such acts having been made offences by statute and punishable accordingly. A mere trespass, however, being an infringement of the owner's rights of property, may be the subject of an action for damages in the County Court; but in the average case the damage done by a person walking over the field of another must be quite inappreciable, and damages will therefore be merely nominal. Probably none but a born litigant would think it worth his while to commence such proceedings; but should one's name and address be taken, it would be well to remember that by at once tendering to the irate landowner, say, the large sum of sixpence as compensation for any damage that might have been done, any subsequent action he might bring against one would be at his own

risk. One word of warning to the reader who may feel disposed to test for himself the accuracy of these remarks: Let him not ignore the warning-board of the railway company placed contiguous to its line, for railway companies have special powers, and the trespasser found wandering by the rails may well find himself run in or summoned, if he escape being run over.

'THE GREATER THE TRUTH THE GREATER THE LIBEL.'

Not long since the writer overheard a conversation in a railway carriage between two persons who were discussing some pending libel action. The one expressed his conviction that the alleged libellous statement was true, and that the defendant would win the case; but the other made what he no doubt considered very short work of that contention when he quoted the well-known maxim, 'The greater the truth the greater the libel.' It was, however, a mere phrase to him, as to most laymen. He did not understand its significance or application. In a civil action for damages for libel, the truth of the statement complained of always has been, and is now, an absolute defence; and the maxim mentioned never has been, nor is it now, applicable. Were it otherwise, the publication of every statement in writing derogatory to the character of any person, however true that statement might be, and however bad the character of the person referred to, might involve the writer in damages and costs —an intolerable position, and one well calculated to stifle all discussion! On the other hand, such libellous statements as are calculated to lead to a breach of the peace may be the subject of *criminal* proceedings. In such proceedings different considerations have always applied, for until 1843 the law accepted no excuse for the publication of a statement calculated to create a breach of the peace, and it was apparently considered that the more truth there was in the statement complained of the greater the probability of the person libelled losing his self-control and attacking the writer. Hence the maxim. But the law was modified in 1843, and now, even in criminal proceedings in respect of a libellous statement, its truth is a justification, *provided* that the accused can satisfy the Court that the publication of the statement complained of was for the public benefit.

THE SIXPENNY STAMP.

Judging from the tendency of the layman to cause a sixpenny Inland Revenue stamp to be impressed upon everything and anything on the least provocation, one would imagine that there was some peculiar virtue in such a stamp. Unless, however, the letter or document happen to contain an agreement or contract, in the proper acceptation of these terms, in having it stamped one is simply making a present to the Government of the money paid. The vital question of agreement or no agreement is quite unaffected by the stamping of the document, and no stamp can ever make a bad agreement good. The effect of failure to properly stamp a document is that it cannot be put in evidence in a court of law until it has been so stamped; and as the stamping after the regulation time will in most cases involve the payment of a penalty to the Inland Revenue authorities, unnecessary expense will have been thereby incurred.

THE PRISONER'S ADVOCATE.

On no subject connected with law is there so much misapprehension among laymen as there is with regard to the duties of an advocate employed to defend a prisoner. From time to time some dear old lady will solemnly ask the man of law whether he does not think it very wrong for an advocate to defend a prisoner whom he knows or believes to be guilty. The feeling prompting such a question is very general, and is due to a failure to grasp that fundamental rule of the British Constitution whereby a man is to be deemed innocent until he be proved guilty. Let one keep that principle in mind, and the morality of the proceeding is beyond question. The advocate's duty is not to say to the Court, 'I believe the accused to be innocent,' for the Court would not allow him to pledge his own belief. He says in effect to the prosecution, 'The Constitution requires you to prove your case against my client before he can be convicted. I shall cross-examine your witnesses to ascertain how far they really speak of their own knowledge, how far they are telling the truth, and what the facts of the case really are. I shall call any other witnesses who may be able to put the Court in possession of any facts in favour of my client which you may fail to bring forward; and when I address the jury for the defence I shall point out all the weak points of your case and any inconsistencies in your witnesses' statements, and then the jury will have to decide whether you have proved your case or not. Unless they are satisfied that you have done so, my client is entitled to be acquitted.' That is the position of the prisoner's advocate. It must not be forgotten that it is the function of the jury, and of the jury alone, to decide as to the prisoner's guilt; and if an advocate were to refuse to take up the case because he believed that the charge against the prisoner were probably true, he would be usurping the functions of the jury. Further, the advocate is only human, and is it not possible that he might be wrong in his conclusion? 'But,' it is said, 'supposing the prisoner has confessed his guilt to the advocate, what then?' By the law of England the onus is on the prosecution to prove the prisoner's guilt. He is entitled to be acquitted if the prosecution fail in this, and in any case he is entitled to have all the facts which may tend to show the true nature of his offence placed before the Court in mitigation of the sentence to be passed on him. Finally, if any one doubts the morality of an advocate defending a person who has confessed that he committed the crime of which he is charged, let that person study the newspapers and take note of the instances which occur every

year in which people give themselves up to the police for crimes which it is subsequently proved they could not possibly have committed, and he will probably come to the conclusion that the present system, under which the advocate takes nothing for granted and leaves to the jury the decision of guilty or otherwise, errs, if it errs at all, in the interests of justice, for it is better far that occasionally a guilty man should escape punishment than that an innocent one should be prejudiced in his trial by the perhaps one-sided conclusions of the person employed to defend him.

BIDDY.

PART III.

ISS PELLICOE stood in her back-garden, a frown on her usually happy countenance, a sigh at her lips. The back-gardens of the two cottages were separated by a low fence—a barrier, but certainly not a screen, between the neighbours. Of late Miss Pellicoe had frequently wished it had been the latter.

Her neighbour's washing was hanging out to dry, and Miss Pellicoe, most modest of females, seemed to be fascinated by the sight. Fascination, however, is not always caused by beauty.

'Oh dear!' reflected Miss Pellicoe, 'I never beheld anything so *awful*. It gets worse every week. I really wonder that woman can have the impudence to call herself a housekeeper! I do indeed! I wonder, too, the Professor doesn't show some spirit, and either make her attend to her duties or dismiss her on the spot. But single and lonely men are *so* timid. I wonder what my father and my brothers would have said if they had been asked to wear things like those. I never saw such rags! Never! It's a shame the poor man should be so neglected. I could almost grab them off the line and patch and darn them before that woman's eyes. I could! —but I—*can't!*'

It was by no means the first time that Miss Pellicoe's kindly—nay, motherly heart and orderly mind had been troubled and disturbed by the unsightly exhibits on and above the washing-green. Again and again she had smothered her honest wrath and homely pity; but to-day that was more difficult to accomplish than ever before. Had Cardigan been a youth she would probably have called upon him straightway, and without a blush offered to do the necessary mending there and then. But as matters stood, such an action on her part was out of the question.

She eyed the garments almost longingly for several minutes, and turned away sadly. Presently, however, she halted abruptly and retraced her steps. Then she continued them leisurely towards the fence, whereon hung sundry pairs of mánly socks. She was constrained to examine the footgear at close quarters.

'If,' she considered, 'his socks are as badly kept as his other things, I 'll—I 'll'——

Well, she did not know exactly what she would do.

Walking along beside the fence, she brushed off several socks as if by accident. She picked them up and returned them carefully to their places. A glance at them was sufficient for her.

'Oh, my goodness me!' she groaned. 'What darns! Simply patches of the coarsest worsted. How the poor soul walks in them I can't imagine! The hideousness of them all! Gray darned with orange; dark blue darned with pink! The toes and heels all lumpy! Oh, that woman!'

Just then the housekeeper appeared at the back-door, and Miss Pellicoe, feigning not to observe her, moved slowly away.

Late in the evening she noticed the housekeeper collecting the socks in a basket, and she could hardly contain her excitement when the housekeeper went indoors for the night—Miss Pellicoe could hear the shooting of the bolt and the turning of the key—leaving the basket forgotten by the side of the fence.

'I am going to have that basket,' said Miss Pellicoe to herself. 'Darns like these are an affront to any decent woman!'

She waited till the lights at the back of the neighbouring cottage went out; then she stole out of doors, across the moonlit washing-green to the fence, and there bent over and secured the basket. With something very like a giggle of triumph, she reached her own door again, and, having closed it noiselessly, made her way to the parlour, on the table of which her darning-basket was already laid open.

At the same moment Professor Cardigan stood at one of the back windows, rubbing his eyes and wondering at his neighbour's extraordinary proceeding. He had been thinking of her and admiring the night from an unlighted room when she removed the basket, and now he knew not what to believe. A miserable thought entered his mind, and perhaps he was not altogether unjustified in giving it accommodation there. Verily, she had behaved suspiciously—come and gone like nothing but a thief in the night! Could she be a kleptomaniac? The Professor, by the way, was not proud of his socks. 'Inartistic necessities' he had termed them in the seclusion of his chamber. Wherefore, he argued with himself, any one who sought to acquire them must be suffering from a moral defect which was to be pitied rather than blamed. 'Thank heaven!' he sighed, 'no one else saw it.' And he went to bed with his ugly secret.

Biddy came to see him the following afternoon, and found him uninteresting.

'How is your aunt to-day?' he inquired, with exceeding carelessness, as she enjoyed her lemonade.

'Auntie Polly got sore head,' replied Biddy.

'Ah!' murmured Cardigan, 'I—I'm sorry to hear that,' he added, avoiding Biddy's eye, which was now turned upon him. 'Ahem!' He felt like a cad when he asked, 'Was your aunt up late last night?'

The youngster, however, paid no attention to the question.

'Goin' away to-morrow,' she suddenly intimated.

'To-morrow?' Surely the Professor's troubles had come upon him in a shower. 'Surely not to-morrow, Biddy,' he said wretchedly.

'Ess. Daddy an' mummy comin' home, Dick,' she returned as if he ought to have been aware of the fact. 'Auntie Polly goin' too.'

Cardigan was silent for a time. At last he said heavily, 'I'm sorry you're going, Biddy. What am I to do without you?'

She was having another pull at her tumbler, and did not reply.

'Goin' in train,' she remarked inconsequently a little later. 'Puff, puff!' she added by way of explanation.

'Puff, puff,' he echoed drearily to himself. 'It's all puff, puff in this world. Nothing remains.—Biddy,' he appealed to her, 'are you sorry you're going away from me?'

'Ess,' she replied, but not very enthusiastically. 'Fink I'm likin' you, Dick,' she said unexpectedly a moment later, dropping the empty glass, fortunately on the turf, and putting her arms about his neck. The next instant she had slipped from his keeping. 'Goin' to see Auntie Polly. Come on, Dick!'

But the Professor would only accompany her to the hole in the hedge. 'Come and say good-bye to me before you go to—to daddy,' he said, 'and see what I've got for you in my study.' He had been hoarding a particularly fine doll as a parting gift.

'Fink I'll come now,' said Biddy, halting in her passage and crawling backwards. She took his hand. 'Come on, Dick!' she cried gleefully, and led him towards his own abode.

Cardigan laughed, which did him a world of good for the time being at any rate, and ere long Biddy was in possession of a new joy.

When they returned to the hedge Miss Pellicoe was on the other side awaiting her charge. The Professor nerved himself to look at her, and she promptly dropped her eyes, while her colour deepened. The Professor groaned in spirit.

Both were ill at ease, and conversation languished between them.

'We leave at ten to-morrow morning,' said Miss Pellicoe in answer to a question of Cardigan's. 'I'm sure I don't know what I'm going to do without Biddy.'

'Neither do I,' he rejoined sadly. 'Pray allow her to come to me for a minute in the morning.'

A few commonplace remarks, and they parted.

That evening the Professor was dull. He could not work, and there was no good now in learning nursery rhymes. He made the books into a parcel for Biddy to take away with her, and sat down with his pipe and dreary thoughts.

About nine o'clock he was disturbed by the appearance of his housekeeper, who entered the study bearing a basket.

'I can't understand it, sir,' she began in rather an unpleasant tone, 'but some one has been interfering with your socks.'

'What?' he cried, starting up. 'Nonsense!' he continued, recovering himself. 'No one would take my socks, Mrs Crawley.'

'I didn't say that, sir. Your socks are here in the basket, and—and so is this,' she said, holding up something brown.

'What's that, Mrs Crawley?'

'It is a child's sock, sir. I may say also,' the woman went on, raising her voice, 'that your socks have been darned'——

'Thank you, thank you, Mrs Crawley.'

'Oh, you needn't thank me, sir,' she retorted, her voice still louder and higher. '*I* didn't darn them. But what I want to know is—*who did?*'

'Hush, Mrs Crawley!'

'I'll not hush!' she suddenly screamed. 'I want to say that if—if I'm not considered fit for my place I beg to be informed of the fact, sir, and not have things done, sich as socks darned, behind my back; and I beg to say that'——

Light burst upon the Professor, and—he could not help it—a laugh leapt from him, a laugh of relief mingled with amusement at his housekeeper. Then he blushed furiously.

Controlling himself at the thought of Miss Pellicoe, he said quietly, 'But, Mrs Crawley, you—er—you must be mistaken, I assure you. How could any one'——

Mrs Crawley, however, had lost her head. She had seen him blush.

'Get your socks darned on the sly, indeed!' she yelled furiously. 'Think I'm not good enough! There! Take your socks, and—and—and'—— Words failed her. She dashed the basket on the floor, and, sobbing wildly, rushed from the room.

Once more Cardigan slept badly.

PART IV.

IN the morning the Professor was waiting by the hedge when Biddy, dressed for the journey, came to bid him good-bye. She was in an excited state, and evinced little regret at the prospect of parting. Cardigan called himself a fool for allowing his

feelings to be hurt by her callousness, and when she had gone in response to a call from Miss Pellicoe's maid, he remembered that the parcel of books he had intended to give her was still lying in his study.

'She wouldn't care about them, anyway,' he thought, as he returned slowly to the cottage. He was inclined to be sulky, for he had half-expected Miss Pellicoe to invite him to be present at the station to see the last of his little friend. But no word had come from her, and a feeling of intense loneliness possessed him.

'No doubt,' he muttered, 'she would have darned *anybody's* socks.'

His depression increased. To lose the cheery company of his beloved Biddy was hard enough to bear, but now he realised that his loss would not end there. With the child away, he would have no excuse for entering his neighbour's garden. The sweet command, 'Come on, Dick!' that had so often prevailed over his backward self would be heard no more. The hole in the hedge was no longer a private entrance for Joy; the hedge itself had already become no pleasanter to his eyes than a prison wall.

'Ah!' sighed Cardigan, sitting down at his desk, whereon lay the uncompleted manuscript of the last chapter of his great work—'ah, I'm afraid I must be content with this. Love-stories are about as far out of my line as—as nursery rhymes. And yet I *did* manage the nursery rhymes with a struggle. *Am* I as old as I was two months ago?'

He got up and began to pace the room.

. . . . . .

The clock struck the half-hour, and he stared at it thoughtfully.

'If I had only some excuse. The books? They might do, but—but—why, by Jupiter, I have it! The very thing!'

One minute before the train was due to start he reached the compartment in which Miss Pellicoe and her niece were seated. He was panting and ruddy, and his wits seemed to have deserted him.

'Miss Pellicoe,' he gasped, 'I—I—I—came to—to return this, thinking—thinking it might be of consequence.'

From his breast-pocket he drew a tiny brown sock and held it out to her.

Red as a rose grew Miss Pellicoe, unable to say a word.

'Mine!' cried Biddy, grabbing the sock and laughing at him.

'Miss Pellicoe,' said the Professor, trembling with a frantic hope, 'I've grown very—er—fond of—of—Biddy. D—do you think she would care to—to be my uncle? No—no. I mean—oh! if I could only explain! I mean'——

'Come on, Dick!' interrupted Biddy. 'Come in puff-puff.'

'May I?' almost screamed the Professor as the guard's whistle blew. 'May I come and explain?'

Miss Pellicoe caught the child in her arms and hid her own hot face behind the young head.

'May I?' implored Cardigan.

The train moved.

'Will you have me, P—Polly?'

'Come on, Dick!' exclaimed Biddy again. 'Auntie Polly's cryin'.'

The Professor snatched open the door and bounced into the compartment.

Biddy found the journey rather a dull one. Dick could not even repeat correctly 'Hey, diddle, diddle!'

THE MONTH: SCIENCE AND ARTS.

HIGH-POWER MICROSCOPY.

At a recent conversazione of the Royal Society, London, Mr J. W. Gordon exhibited a new form of microscope which he has invented, by means of which enormous magnification of an object can be attained without the blemishes due to optical causes which hitherto have marred such images. To make the matter plain, we may suppose that the enlarged image of an object is received from a microscope-lens upon a ground-glass focussing-screen, and that then another microscope is employed to still further enlarge the image so formed. This is, of course, quite feasible; but the grain of the glass would be magnified together with the image, and would quite vitiate the result. Mr Gordon uses a translucent screen of the finest possible texture, and he keeps it in continual motion while the object is being viewed or photographed. By this means the grain of the screen is eliminated and the greatly magnified image of the object alone seen. Specimens magnified to the enormous extent of ten thousand diameters were shown as proofs of the efficacy of the method adopted.

THE ASSOUAN DAM.

It is universally admitted that the barrage across the Nile at Assouan is a great success, and that by its aid thousands of acres of hitherto unproductive land will be brought under cultivation. It is now sought to still further extend the benefits of this great engineering work by heightening the dam, and the old objection has arisen that this course must result in the destruction of certain of the Nubian temples, notably those of Philæ. It would seem, however, that this is not the case, for the engineers have so underpinned and renewed the foundations

of these temples that they are now considered to be in a state of greater stability than ever before, and in really better condition than any other existing buildings in Egypt. The barrage has, indeed, had the effect of giving these temples a fresh lease of life; but it must be admitted that their picturesqueness has gone for ever. The water has drowned the trees, and its level is so much higher than of yore that the temples no longer occupy a commanding position. We must set against this improved conditions of life for a vast number of people.

SULPHUR-MINING.

An interesting account of the sulphur industry in Sicily appears in the *Engineering Magazine*. Nine-tenths of the native sulphur used in Europe comes from Sicily, and about one hundred thousand persons are dependent upon it for their livelihood. After the position and depth of the sulphur deposit has been ascertained by boring, a shaft is sunk, which is subsequently divided longitudinally into three sections. Two of these are occupied by the up and down hoisting-cages, while the third is devoted to the pumps for extracting water from the mine. Great danger arises from the generation of gases within the rocks, and these gases are of three kinds: first, the poisonous gas, hydrogen sulphide; next, an asphyxiating one, carbon dioxide; and, thirdly, marsh-gas, the dreaded 'fire-damp,' which, as we all know, is explosive. The hard sulphur is extracted with pickaxes, and is separated from its gangue by heat—steam being now generally employed. It is then moulded into bricks, and is ready for the market. The theory proposed to account for the presence of sulphur in the soil is that powerful emanations of hydrocarbons under immense pressure have acted upon calcium sulphate while in solution or during deposition, separating its constituents, lime and sulphur.

HARNESSING THE SUN.

Many attempts have been made to concentrate the sun's rays in such a way that the heat thus obtained could be utilised direct, or as a source of motive-power. At the St Louis Exhibition, not far from the horticultural building, was a remarkable structure designed by Professor Himalaya, which he called a reducing solar furnace, the object of the apparatus being the production of a temperature higher than that ever recorded. The highest temperature known is that of boiling carbon, which he places at 3500 degrees centigrade, just in the same way that 100 degrees centigrade represents boiling water. And he hopes to exceed this in his solar furnace, which consists of a huge frame bearing a multitude of reflectors arranged side by side in parallel rows, the rays from which converge to a central point, where is placed a steel crucible. This is the fourth solar furnace which the Professor has designed, the one which was last completed giving him a temperature of 2000 degrees centigrade. It may be added that the top of the present apparatus is forty-two feet above the ground, with a width of thirty-six feet, the whole being supported on a stiff latticed column of steel. We may presume that the best results from the solar furnace will not be possible until the summer.

THE FUTURE OF GAS.

The International Gas Exhibition, which opened for one month in London on November 19, under the patronage of the President of the Board of Trade, was designed to make the public better acquainted with gas as an illuminant, a cooking agent, a heater, and a motive-power. The rapid increase in the use of the electric light is calculated to make people fancy that gas as an illuminant is on the decline. This is by no means the case; indeed, it may be said that the cheapening of the incandescent mantle has vastly increased the consumption of gas. Burnt in this form, it gives a far more brilliant and much cheaper light than the sixteen candle-power electric glow-lamp. In thousands of households all the cooking is done by gas, and gas-stoves for heating, in which we must candidly admit there is enormous room for improvement, are largely used because of their cleanliness and convenience. The use of gas, instead of coal, for cooking and heating represents a great gain to the community in the diminution of the smoke nuisance in our larger towns and cities.

THE WORLD'S LONGEST TUNNEL.

One hundred years ago Napoleon was employing an army of about forty thousand workmen to construct that famous road which runs from Switzerland into Italy over the Simplon Pass. To-day workmen are busily engaged in connecting the two countries by a tunnel more than twelve miles in length. It was hoped that this road would be open for railway traffic in the spring of 1905, and the circumstance that the two headings driven from the opposite ends of the tunnel were in October within three hundred yards of meeting seemed to justify that hope. But an unexpected difficulty has arisen in the shape of copious springs of hot water, and work on the Swiss side has had, for the present, to be suspended. The hot-water trouble has also made itself apparent on the Italian side, but not to the same prohibitive extent. The anxieties of the engineers employed in this great work will naturally increase as the intervening diaphragm of rock becomes thinner and thinner. Possibly the junction of the tunnels will take place before these words appear in print, and we can only hope that it will be free from disaster to those engaged in the work.

FOG-SIGNALLING AT SEA.

Any one who has had the disagreeable experience of being on shipboard in a fog, and has heard the dismal tolling of the bells of ships at anchor and the hootings of vessels in motion, and has endeavoured to guess at the actual direction from which any particular sound comes, will have had full opportunity of judging of the value of these rough

methods of signalling. They are most unsatisfactory, and therefore fog at sea generally spells disaster to many ships. In the early part of the year experiments were carried out with the Marconi wireless telegraph system with the view of testing its value as a means of communication between ship and shore in the presence of fog, and it was found that in every instance it was reliable. More especially it would be useful as a means of communication between isolated lightships and the shore, for the crew of a lightship are often in a position to know of impending danger, and could by means of wireless telegraphy summon timely help.

ANCIENT WORKS OF ART.

In the course of a recent lecture at the Camera Club, London, Professor Flinders Petrie, the eminent Egyptologist, showed by means of photographs of various articles which he had unearthed that nine thousand years ago the Egyptian craftsmen had a fair knowledge of materials and the method of working them. They had also ideas of artistic adornment, as many pieces of pottery show. But there was one article of later date, 5000 B.C., which was of intense interest, for it is the oldest piece of worked ivory known. It is the carved effigy of one of the earliest kings, and was found some thirty feet below the present surface of the ground. So soft was it with age and the moist character of the ground in which it was discovered that the dirt had to be most carefully removed from it by the aid of a camel-hair brush, after which, by chemical means, it was hardened so as to have a fresh lease of existence. The image is one of artistic qualities, and the face is full of character, indicating the countenance of a keen-witted, wily man, very different from the calm, regular features of the effigies which adorn the monuments of later date. Dr Petrie is not only a painstaking explorer, but a father to the devoted band of natives working under him. They regard him as a great medicine-man, and go to him for treatment of all their ailments.

MOWING BY MOTOR.

A well-kept lawn is a pleasant thing to look upon, but it requires, as all good gardeners know, a great deal of attention and constant work to keep it in order. The mowing-machine has long displaced the man with the scythe, and does the work much better, but the operation of mowing even with a good machine is no child's-play. The necessary horse attached to the larger machines leaves hoof-marks on the turf, and such a machine requires the services of a man and a boy. The motor lawn-mower patented by Messrs Ransome, of Ipswich, is free from these disadvantages, and will do the work very much quicker than any horse-drawn machine. The largest size, which is intended for cutting the grass of cricket-fields, golf-links, and the like, has a forty-two-inch cutting-cylinder, is driven by a six-horse-power petrol motor, can be used as a roller only when desired, and is controlled by one man. The smallest-sized machine made is fitted with a twenty-four-inch cutting-cylinder, and will get over much work in a day, for it travels as fast as a man walks, and can be steered with ease round trees and flower-beds.

A NEW PRESERVE.

We have two dried fruits always with us, and at moderate price, too: dried apricots and dried apples, sold at from sixpence to eightpence per pound. That *seems* a high figure for fruit; but it is not really, for there is so much more in a pound of dried fruit than of fresh, because the water has been driven off by evaporation, and only the solid part of the fruit is left. Many housewives fail to make sufficient jam for the year, and would be glad to renew their stock; but, alas! the fruit is wanting. Is it? Yes, and no. *Fresh* fruit is not to be had, but dried fruit is. Fresh fruit from the garden is full of water, and for this reason is picked as dry as possible, and all the vessels employed in converting it into jam must be dry also. The reverse process is needed in treating dried fruits. We must give back to these apricots or apples their moisture; they also require to be cut smaller. Cut each piece into three or four, then throw them into a clean earthenware pan, and pour over them a quart of cold water to each pound of fruit, and allow it to soak until the next day. To each pound of fruit allow a pound of sugar; put all together into a preserving-pan and *simmer slowly* for two hours, or until the fruit has become jam and has set rather firm, but it must not boil. Should the preserve be preferred sharper in flavour, add the juice of a lemon during the last quarter of an hour's simmer, and also half an ounce of bitter almonds blanched and halved to each two pounds of fruit. The last is to give back that piquancy of flavour which is always present in fresh plums, and which is obtained from the stones in the process of cooking. This preserve must be kept in a dry, cool cupboard or store-room.

SOUND MAGNIFICATION.

Many attempts have been made to intensify the volume of sound emitted by telephones, phonographs, gramophones, and similar instruments, and as long ago as the year 1877 Edison made experiments in this direction, without, however, any practical result. The Hon. C. A. Parsons, of turbine fame, has patented a method which, according to all accounts, is likely to have a wide future before it; and whereas others seem to have rushed to protect their ideas while these were yet in the paper stage, Mr Parsons has first proved that his machine will work. In his patent-specification he says: 'The tone of the instrument is such that at a short distance it is almost indistinguishable from the original voice, violin, or band, the usual nasal and scratching sounds being almost obliterated.' This statement is fully borne out by those who had recently an opportunity of hearing the apparatus in action

at the Royal Institution, London. It is a very compact apparatus, not larger than a hat-box, but it is a giant in the matter of sound. A pointer is caused to move in and out of the hills and dales representing the record, say, on a gramophone plate, and these movements are converted into vibrations of a column of air by a device which, roughly, imitates the action of vocal chords. In the course of this translation the sounds are so much magnified that they are sufficient to fill a large hall. The apparatus, in fact, represents a portable orchestra.

MEDALS.

Among the hundred and one articles which tempt those industrious workers who make it the business of their lives to collect things medals have long been numbered; and after every war a number of these decorations are thrown upon the market. Just now medals are unusually cheap, owing to the death of a great collector, and it may be of interest to note the prices which some of them have reached. A South African medal with six bars can now be bought for ten shillings, as against the five pounds which it fetched when first issued. The highest price ever recorded for a private soldier's Peninsular medal, one with thirteen bars, was fifty guineas. An old Indian war medal awarded to an officer, with about half-a-crown's worth of silver in it, has fetched as much as sixty guineas. Then there are unique medals which naturally command fancy prices. For example, the bugle and four medals of Jay, who sounded the famous charge at Balaklava, were sold for nearly eight hundred pounds. Again, there is a medal once owned by Nelson, which was presented to him by a Mr Davidson, who was so disgusted that no national medal was struck to commemorate the battle of the Nile that he had one made at his own expense, and presented it to the famous sailor. This brought one hundred and eighty pounds at a London sale-room a few years ago. The present value in the medal-market of a Victoria Cross is between forty and fifty pounds.

JAPANESE HOSPITALS.

Two English ladies, Miss M'Caul and Miss St Aubyn, were, by the courtesy of the Japanese Government, permitted to join General Kuroki's army, so that they might go to the front in order to study the methods adopted in the treatment of the Japanese sick and wounded, and they report that the Japanese can teach us much in the matter of surgical and medical outfit as well as in general management of hospitals. The equipments they describe as magnificent, everything going like clockwork, while at the same time a rigid economy is practised. There are no women nurses at the front, all the work being done by men; but the sick and wounded are most carefully tended, the medical science and nursing skill of the Japanese being described as wonderful. The English visitors were especially struck with the design and lightness of the surgical appliances, which were most ingenious and efficient. It may be mentioned that on her return from the Far East Miss M'Caul was received by the Queen, who has ever taken a kindly interest in hospital equipment.

'HOW TO OBTAIN PERFECT HEALTH.'

We have received from the Gem Supplies Company, Limited (121 Newgate Street, London, E.C.), a booklet with the above title, which advocates the use of the portable Turkish bath as a means of promoting the activity of the skin. The pamphlet is full of useful hints with regard to diet, exercise, clothing, &c., and gives general rules for the maintenance of good health, which should appeal to all classes of readers.

'THE PASSING OF CAPE CASTLE.'—A CORRECTION.

The Editor regrets that the writer of the article on 'The Passing of Cape Castle' (*Journal*, 1904, page 627) should have been misled by a statement made in the newspapers at the time, that 'the historic castle at Capetown had been offered for sale, and this time purchased.' Some years ago there was a talk of approaching the Imperial authorities with a view to its purchase, but such an outcry was raised that the project was abandoned. That it has not been sold, however, will not, it is hoped, make less valuable the rest of the information in the paper. A building known as the 'Main Barracks' has, however, been pulled down and the site offered for sale.

HER NAME.

You would ask me her name? Nay, my lips cannot frame
The name that I cherish thus lightly;
Rather learn of the breeze, as it sighs through the trees,
For it whisp'reth it unto them nightly.

You would ask me her name? Nay, go list to the same,
When the pow'r of grim winter 's declining;
'Tis the song the birds sing, in their welcome to spring,
To welcome the sun and his shining.

If her name you would know, blue forget-me-nots blow,
Where the secrets they hear of the river;
Ask the name of the song, as he hurries along,
That the river is singing for ever.

Do you think that the name you will hear is the same
That I hear in my ears whispered ever?
No; the name *you* hold dear is the name you will hear
From the birds, from the breeze, from the river.

HEPBURN HAY WELTOUN.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

MAJOR MELLORDYCE'S WIFE.

By EMERIC HULME-BEAMAN.

PART I.

'AND so,' said Ackworth, 'you're married?'

It was in the smoking-room of the Troglodyte that he met Mellordyce, whom he had not seen for two years. Ackworth had just returned from one of his mysterious foreign missions, the exact nature of which, and the precise character of his calling, were points known only to himself and certain high departmental officials. Mellordyce, of the Intelligence Branch of the service, could hazard a nearer guess on the subject than most men. He and Ackworth had been long acquainted with each other, and in certain secret affairs had, in an indirect way, co-operated; notably in the Moscow conspiracy, where, thanks to Ackworth, Major Mellordyce had been instrumental in saving the credit of the British Government, to the complete discomfiture of a certain notorious political spy. This, however, is ancient history, as the secret records of the War Office can testify.

Ackworth had received with some surprise the news of Mellordyce's marriage, that had taken place six months ago in Paris. He could not conceive of Mellordyce as a married man; and for himself, he had little faith in women as serviceable adjuncts to a life of active diplomacy. Not because he did not consider women good diplomatists, but because he knew that a woman, if she is a diplomatist at all, is too good a one to be a safe companion.

'Yes,' said Mellordyce. 'It is true. I am married.'

Ackworth observed that there was no regret in the Major's tones. In six months there is time enough to experience regret for a man of judgment, who perceives his judgment (in this one very vital particular) to have been at fault. Mellordyce had always been a man of conspicuously sound judgment, so that Ackworth felt satisfied.

'I hope you will give me the pleasure of meeting Mrs Mellordyce,' he said.

Major Mellordyce gave him the pleasure the same evening, when Ackworth dined at his house in Lancaster Gardens.

'We are only in town,' he explained, 'for a few weeks. There is a matter at the War Office requiring investigation. Afterwards it may be Paris—or Berlin. Ah! here is my wife,' he added, as the door of the drawing-room opened and a woman swept in. She was of medium height, young and slim, and dressed in the extreme of taste. Also, she was very beautiful. None of these things—all of which he took in at a glance—surprised Ackworth. Something else, however, surprised him considerably.

'Vera,' said Major Mellordyce, 'let me introduce you to my friend Mr Ackworth.'

Mrs Mellordyce smiled charmingly and held out her hand. Ackworth bowed as he took it.

'I have heard my husband speak of you,' she said. Her accent was foreign, though she spoke English apparently without an effort—only a little slowly, like one who has to translate her sentences mentally before uttering them.

Ackworth throughout dinner was very thoughtful. His impassive face betrayed no emotion, and he met the dark, smiling eyes of his hostess from time to time with a sphinx-like composure. The conversation was mainly of social affairs and the opera; for these two men made it a rule never to discuss serious topics in front of ladies. Afterwards, when Mellordyce and Ackworth were sitting over their cigars, it was natural—indeed unavoidable—to pass some congratulatory comment upon the new situation. Ackworth complimented the Major gravely.

'She is a lovely girl,' he added.

Mellordyce smiled, looked a little embarrassed, as though caught in a schoolboy folly, and fidgeted with his wine-glass. Ackworth could see that he was very much in love.

'She 's an angel,' murmured Mellordyce.

Again Ackworth reflected that Mellordyce had

[*All Rights Reserved.*]

always been a man of conspicuously sound judgment; also, that his own position was likely to become singularly awkward.

'Let me see; it was—I believe—in Paris that you met her?' he observed.

'Yes, in Paris. Her name was Lataille. She was staying there, on a visit, with some American people, whom I came across.'

'Ah! she speaks English well—for a French girl.'

'Her father was French, her mother American,' explained the Major. 'Her father is dead.'

'And her mother?' asked Ackworth in the tone of a man who puts a merely conventional question.

'In New York,' said Mellordyce. 'An invalid. The preliminaries were conducted by cablegram,' he laughed.

'Ah! yes.' Ackworth rose presently to go. 'By the way,' he remarked, putting on his light overcoat, 'you recollect that little affair last year at Sofia? Laramoff's, I mean.'

Major Mellordyce gave a triumphant chuckle.

'I am not likely to forget it, my dear fellow,' he said. 'I flatter myself there's a balance to my credit still on that account. Colonel Laramoff was shot a week after I revealed his plot to the Prince. Of course it was not strictly my business, but it happened, you see, to come my way while I was engaged on something else for our own people; and there's no harm in standing well with a foreign prince if opportunity offers.'

'None. The man was a dangerous revolutionary. A Bulgar, I suppose?'

'Without doubt. But why do you refer to him?'

'I met a man last week in Vienna who told me the Anarchists were taking up Laramoff's cause—that's all. A mere peg to hang some more of their infernal machines on, of course. Still, a word to the wise, you know.'

'Thanks,' said the Major. 'I'll give Bulgaria a wide berth in future. Good-night, and remember that I am at Lancaster Gardens for a month. Drop in as often as you can and like.'

Ackworth walked back to his hotel in a meditative mood. When he arrived in his room he unlocked one of his travelling-trunks, and took from it a small leather-bound note-book. Running his eye down the index of its contents, he turned to a certain page which contained copious entries written in cipher. The careful perusal of these entries confirmed him in a suspicion which had already grown to something like a certainty in his mind before the soup had been removed from Major Mellordyce's dinner-table. It seemed to Ackworth very singular that Mellordyce himself should have betrayed so strange a lack of that perspicacity in his private affairs which in the conduct of his professional ones had been his most conspicuous attribute. He jotted down the address of a house in the East End, and then closed his note-book and replaced it in his trunk.

Meanwhile Major Mellordyce and his wife were sitting together in their drawing-room. Presently Mrs Mellordyce rose and walked across to the window.

'How hot it is to-night!' she said, throwing up the sash. 'I did not know it could be so hot in England.' Then, after an instant's pause, she asked abruptly, without turning round, 'What is Mr Ackworth?'

Mellordyce laughed.

'He is a traveller,' he answered.

'Ah! you will not tell me,' she said, with a shrug. 'Why is that? There is a mystery about your friend Mr Ackworth. I am afraid I do not like him.'

'Do not like him, Vera! Why?'

'He is too clever,' she replied.

'My dear girl, he did not make a single brilliant remark during the whole of dinner. He hardly spoke at all.'

'No; that is why. He listened. It is not the man who talks and says things who is clever always, but the man who knows how not to say things. Mr Ackworth is that sort of man. He did not like me, either. We are what the French call *antipathiques*. Perhaps he is right,' she sighed.

'You are in a *triste* humour to-night,' smiled the Major. 'Aren't you well, Vera?'

She turned her head and smiled at him over her shoulder.

'Yes; but I have a headache.'

Mellordyce rose and crossed over to her side. He put his arm round her waist, and as he drew her towards him he felt the girl shiver.

'My little Vera, you are not well,' he said tenderly.

She closed her eyes tightly, as if shutting out some horrible vision.

'Yes, yes, I am quite well,' she answered in a low tone, and her opening eyes rested with mute appeal upon her husband's face. 'Pray do not question me,' she added, with sudden petulance. 'I assure you I am quite well.' Her moods, in their quick transitions, were not unlike a child's, and Mellordyce—to whom, indeed, she seemed no more than a child—was always ready to extend a ready indulgence to them.

'That's right,' he said cheerily. 'You must forgive my anxiety, Vera, for you know that I love you more than my life, little one.'

With Mellordyce this was no idle expression of vacuous and meaningless sentiment. He was one of those men who can love but once in their lives, and when they love it is with a love that is more than love—enviable of the seraphs. It was a strange expression that passed over his young wife's face at the words; but her head was turned away, and in the semi-gloom Mellordyce did not see it.

Three evenings later Major Mellordyce was dining at the Troglodyte with Ackworth, at the latter's invitation. Mrs Mellordyce was spending the same evening with an old French lady, a friend

of her father's, who was now living in London, and whom, as the Major's wife, with a pretty little moue, remarked, it was a charity for her to visit occasionally.

In such charitable exercises Mellordyce was the last to thwart the gentle instincts of his wife. The occasion left him free to accept with a clear conscience Ackworth's invitation. The dinner was a good one; for if you choose to pay for it you can get the best dinner in London at the Troglodyte Club. Nor was Ackworth the man to mar a good dinner by the introduction of grave topics of conversation during its course. It was not, therefore, till the coffee and liqueurs had been set on the table and the waiter dismissed that he lit a cigar and looked across at his companion.

'Mellordyce,' he said, 'I have something to say to you; something that you will not like to hear, something that I like still less to tell; but you and I have known each other a long time, and it has got to be said.'

The Major regarded Ackworth uneasily.

'Well, say away,' he remarked after an instant's surprise.

'It's about your wife,' said Ackworth.

Mellordyce started and his brows drew together in a quick frown.

'Stop!' he said. 'You are on very dangerous ground, Ackworth. My wife is sacred. The man who utters a syllable against her—well, you know me,' he concluded significantly.

'Perfectly,' was Ackworth's calm rejoinder. 'And I think you know me. You know I should say nothing without very good cause, or except under the conviction—the conviction, mind—that it is necessary for you to hear it.'

'You're right,' agreed Mellordyce. His face had grown hard. 'Whatever you have to say, I'll hear it. Afterwards—that is your affair. But I warn you.'

'Then I will ask you a question,' went on Ackworth. 'Who was your wife's father?'

'A French gentleman—Monsieur Lataille.'

'No,' said Ackworth quietly. 'He was a Bulgarian gentleman called Laramoff.'

There was a moment's silence. Then Mellordyce gave a little laugh.

'You're mad, Ackworth,' he said.

Ackworth shrugged his shoulders.

'I never make a statement unless I can prove it,' he observed. 'The instant you introduced me to Mrs Mellordyce I recognised her. I met her once at Belgrade—at the house of Madame Ladovitch. I never forget a face. In my private note-book I have an entry relating to the Laramoff affair; and also, as a corollary, certain information respecting an Anarchist society—a branch of the Central Committee—which has an offshoot in London. I told you the other day that the Anarchists had taken up Laramoff's cause. It is quite true. From the day of Laramoff's execution you have been a marked man, Mellordyce. Your life would scarcely be worth a day's purchase across the Bulgarian frontier. In London it would be worth more—except for one circumstance.'

'Well,' said Mellordyce in a low, suppressed voice, 'what circumstance?'

'That your wife is the daughter of Laramoff and a member of the society that has resolved to kill you.'

'A lie—a black lie!' exclaimed Mellordyce, half-starting from his chair.

Ackworth shook his head.

'I wish it was,' he said. 'You can conceive that it is not pleasant for me to tell you this.'

'Have you any more to say?'

'Yes. Your wife married you in order to carry out the wishes of the society. I can only explain the fact that you are alive six months after your wedding on one hypothesis. It is that your wife loves you and is shielding you. Women are incomprehensible. One more thing. You tell me that Mrs Mellordyce is spending the evening to-night at the house of an old French lady?'

'Yes.'

Ackworth took a small piece of paper from his pocket and handed it across to Mellordyce.

'There is the address of that house,' he said.

Major Mellordyce glanced at the paper, and read on it the number of a house in a street quite unfamiliar to him.

'I don't understand,' he said in a hard tone.

'The house is used as the meeting-place of Anarchists. It won't surprise *you* to hear that many of the Anarchist plots of Europe are hatched by obscure foreigners ostensibly living respectable workmen's lives in the East End of London.'

'And you tell me that my wife is an Anarchist—*my wife?*'

'You forget that she is the daughter of her father,' replied Ackworth, 'and that her father died a martyr to revolutionary principles.'

Mellordyce shuddered. If this were true—and Ackworth never made a mistake—the end of his dream had come. He wondered vaguely if all human happiness was but a dream—shorter or longer—yet from which there must arrive the inevitable awakening. A sickening sense of loss—of desolation almost—was already gnawing at his heart. But he would not give in so soon.

'I will not believe it,' he said slowly, 'without proof. It means too much for me. I refuse to believe it.'

Ackworth glanced at his friend pityingly.

'Mellordyce,' he said, 'God knows I am sorry for this—sorrier than I can say. But you must believe it. You have got to face it. We all have to face the truth sometimes. And sometimes men go under when the truth hits home. But they are the cowards. I never came across the man yet who would dare to call *you* a coward.'

'Produce your proof,' said Mellordyce. 'I won't flinch, man! But if you can't prove your words I shall kill you.'

'You and I are going now to that house,' replied

Ackworth calmly—'the house of the old French lady—and if the proof fails you may kill me.' He looked at his watch. It was eight o'clock. He had purposely arranged that they should dine at seven. 'It will take us nearly an hour to drive there,' he continued. 'The meeting is to commence at nine o'clock. We shall be in time.'

Mellordyce rose without a word and followed his friend to the cloak-room. From the inner pocket of his thin overcoat Ackworth drew a small case. 'In visiting the houses of—old French ladies, one has to be prepared,' he remarked. 'Here are two pocket-revolvers—both loaded. I don't pretend that we are not risking our lives in paying this visit; but it will not be the first time we have done that, you and I.'

Major Mellordyce took one of the revolvers and slipped it into his hip-pocket. Five minutes afterwards they were driving rapidly in a hansom towards that district which lies between the Mint and Wapping.

'You know the house—you've been there before?' said Mellordyce presently.

'Yes; I know it. Also the password.'

The two men relapsed again into silence. Mellordyce did not ask Ackworth how he had acquired his information. Both knew enough of the methods of the other to render such questions superfluous. Mellordyce knew, too, that there were very few things in connection with such matters as these that Ackworth did not know. He was not, therefore, in the least surprised to find his friend perfectly familiar with the rendezvous and secret signs of an Anarchist society in London. It was merely Ackworth's business to be familiar with all these things. He was thinking of something quite different as they drove along. He was thinking of his wife—trying to adjust his mind to a perception of her as something other than an angel—and the process of adjustment was like a surgeon's knife on a raw wound.

At length the cab slackened speed, proceeding less confidently, as though the driver were uncertain of his locality; and Mellordyce, glancing out of the window, was aware that they were passing through one of the squalider quarters on the north side of the river. There began to be perceptible a tarry character in the air, a nondescript kind of odour redolent of wharves and dockyards, and mixed with a strong suggestion of leather.

Ackworth put his head out of the window and gave a rapid direction to the driver. The cab proceeded another hundred yards and stopped.

(To be continued.)

THE LIGHT OF THE GLOW-WORM.

By Dr T. Lamb Phipson.

SCIENTIFIC observers often meet with scant justice at the hands of literary men; and recently it was asserted by a well-known writer that 'absolutely nothing' was known about the light of the glow-worm. The fact is, we know as much about that marvellous phenomenon as we can ever hope to know of any of the great mysteries of Nature. Justus von Liebig once said that Nature will answer all our questions, and these questions are our experiments. It is true that experiments often require much patience and a certain gift of observation with which every one is not endowed.

The electric commotions produced by the *Torpedo* and the *Gymnotus* have been traced, in these fishes, to a special organ, a complicated structure connected with their nervous system, and they have been investigated with considerable success by modern electricians. In the same manner the phosphorescent organs of the glow-worm and the fire-fly have, during the last half-century, been the subject of numerous inquiries, but with somewhat less success, because in this case the organ itself has not been so thoroughly distinguished and described, and the light is not produced by this organ directly, but by a secretion which issues from it in the same manner as bile is produced by the liver or saliva from the salivary glands. This secretion has been called *noctilucine*. It is a white unctuous substance, devoid of structure, and drying up into thin, white, shiny films, like the *mucine* which issues from the body of the garden snail. It is probably as complicated in its chemical nature as are many other glandular secretions produced by animals higher in the scale.

Noctilucine is produced not only by the glow-worm (*Lampyris*) and the fire-fly (*Elater*), but by the *Scolopendra*, a myriapod or centipede not uncommon in the soil of our rose-beds and on our garden-walks about the middle of the month of September; by the *Pholas*, a mollusc that bores into the woodwork of seaports and ships; and by the tiny *Noctiluca miliaris*, which is the chief cause of the phosphorescence of the waters of the English Channel; not to mention the numerous gelatinous beings or polyps figured and described in my work on *Phosphorescence* (London, 1862), and which are washed by the waves upon the sands of our coasts.

It is more than probable that the peculiar substance noctilucine, which shines in the dark like phosphorus, is also produced by the decomposition of many organic substances—for instance, by the flesh of fish and by that of other animals; and I have recorded instances in which it has been observed on the skin of man himself in cases of illness, and in various animal secretions. I presume that it is also present sometimes in vegetable substances, such as potatoes, which show a phosphorescent light when

they decay under certain conditions of temperature and moisture, and that it is the substance which causes the phosphorescence of certain fungi, such as the mushroom (*Agaricus*) that is not uncommonly met with in Italy at the foot of the olive-tree.

In all cases where noctilucine is present it yields the same kind of spectrum. When subjected to what is termed 'spectral analysis' (that is, viewed through a slit and a prism) it yields a band of light extending between the spectrum lines E and F, which in the case of the brilliant fire-flies of the West Indies will continue sometimes as far as the line C. In this spectrum we see neither bright lines nor dark bands; it is what is termed a 'continuous spectrum.'

That the light of noctilucine will affect a photographic plate can be put in evidence in the following manner: On a small cardboard box with a perforated lid, and having a sensitive photographic plate at the bottom of it, a glow-worm is placed; and the whole being covered with a glass tumbler standing on two thick straws (so as not to exclude the air), it is left in a dark cupboard all night. In the morning it will be found that the image of the perforations in the lid of the box have been reproduced upon the photographic plate.

The chemistry of noctilucine is a complicated subject into which I cannot enter here. Its existence as a special product of decayed fish was first hinted at in 1862 in my little work already mentioned; and it was first described in a pamphlet which I reprinted from the *Chemical News* in 1875. A year later my discovery was confirmed by Professor Ch. Robin and Dr Laboulène of Paris, in their researches on the fire-flies of the West Indies.

I first obtained this curious product by allowing several large centipedes (*Scolopendra electrica*), which are not uncommon in my garden at Putney, to crawl about in a porcelain dish with vertical sides, covered by a sheet of glass. When irritated these centipedes secrete a considerable quantity of it, which shines in the dark for a long time after they have been allowed to escape. This was in September and October. Since I made these observations several artificial organic substances of a similar nature have been discovered; and numerous phosphorescent *bacteria* have been met with, besides the luminous infusoria described by Ehrenberg a great many years ago, which appear to possess the faculty of producing noctilucine.

With regard to the glow-worm and fire-flies being able, as it were, to extinguish their light at will, it is accounted for by the fact that the organ which produces the noctilucine is under the influence of the nervous system of these insects. It is well known how much, in the higher animals and in man himself, the secretions of the glands are under the control of the nerves. This is notably the case for the salivary glands, and the old expression, 'His mouth waters at the sight of food,' is an apt illustration. I believe that in the little *Noctiluca miliaris*, a tiny being in which no nervous system has yet been detected, and which causes the beautiful phosphorescence of the waves on our coasts, there must exist an organ which secretes noctilucine. These little melon-shaped animals, that are not so large as a pin's head, so long as they are quiescent come to the surface of the water and remain dark; but when the glass which contains the water is slightly struck with a pencil or the finger they sink down, and glow brightly like diamonds as they descend, as if their luminosity depended upon the movement and contraction of their bodies.

In all these cases of animal phosphorescence, the production of the light appears to be due to the oxidation or slow combustion of the light-giving substance by the air causing the gradual decomposition of the noctilucine; but this substance will shine for some time under water, until all the air in that liquid is exhausted. It has been noticed that the eggs of the glow-worm are luminous in the dark for some time after they have been deposited. The glands which secrete the noctilucine in the *Scolopendra electrica* are situated under the scaly rings of the centipede's body, like those which secrete the wax in bees. At a certain period of the year (about October) the common earth-worm (*Lumbricus*) is highly phosphorescent, especially those found in warm dunghills; and when their light is viewed through a spectroscope it also gives the spectrum of noctilucine which I have already described.

GIANT CIRCUMSTANCE.

By JOHN OXENHAM, Author of *Barbe of Grand Bayou*, *Bondman Free*, *John of Gerisau*, &c.

CHAPTER V. (*continued*).—HOW GEOFF CAME HOME, AND WHAT HE FOUND THERE.

GEOFFREY was in Bournemouth the same evening, and called at the Mont Doré as soon as he judged they would have finished dinner, and asked for Lady Eugénie.

Mr Devon had discussed with himself the question as to whether he should advise her ladyship of Geoff's approaching visit or should let him take them unawares. On consideration, and thoughtful of the future, but still with some reluctance, he finally sent her a telegram saying that Geoffrey would probably be calling on them. Lady Eugénie had therefore had time for preparation, and was not surprised when his card was brought in to her. She had sent Una off to bed early as an invalid, and she never told her of Geoff's visit.

'Well, Geoffrey, my dear boy! And how are you after all your worries and troubles?'

'I'm all right, thank you, Lady Eugénie. The matter hasn't troubled me much—that is, on my own account, I mean. How is Una?'

'She's in a very low state,' said Lady Eugénie, with a despondent shake of the head—'quite an invalid at present. It seemed to knock her right over. She was at your house when the first news came, you know, and she crept home like a ghost, and has hardly lifted her head since.'

'But you have told her, I suppose, that the matter is all right, as far as I am concerned?'

'Yes, she has been told that, of course. But she does not seem able to pick up again at all. She eats nothing, and she gets very little sleep, and she is listless and tired all the time.'

'Perhaps I can make her understand things better. It would be a shock to her, I know. I have been very anxious about her.'

'She's in bed, and the doctor says the more rest she can get the better. Sleepless nights are very wearing, you know, and she feels it the more because as a rule she sleeps so very soundly.'

'Perhaps to-morrow'——

'If you would not mind looking in then. But it must depend entirely on what the doctor says. At present his orders are most stringent—perfect quiet and no disturbance of any kind.'

'I am returning to the front almost immediately. I would very much like to see Una before I go, even if it were only for a few minutes.'

'When do you go?'

'At once—when I have seen Una. There is nothing to keep me here, and I want to get out there again before the fighting begins.'

'Of course,' said her ladyship. 'I do hope you will be in time. The front is full of possibilities for you;' and if her ladyship's extremest thoughts had been known they would not have looked nice even to herself. For among them and the possibilities was undoubtedly the thought that the front is where men get killed, and that if Geoffrey Challis never came back it would be much the simplest way out of the business.

'If you will call in to-morrow I will see what the doctor says,' said Lady Eugénie. 'But, please, don't count too much upon it, for he is very definite about her. The moment he saw her he said, "Bed is the very best place for you, young lady!" And he said to me afterwards that her nerves were in such a state that she would need the utmost care to avoid a complete breakdown. It is a very serious matter. You remember poor Anne Bevil, the Duke of Cheviot's youngest daughter? They had to place her in a—under restraint, you know, and now she's in a convent, broken for life, and all nerves—horrible!'

'I will call to-morrow, with your ladyship's permission,' said Geoff quietly, and took his leave.

He prowled disconsolately about the deserted front for a time, and then went to his hotel and to bed, but slept little.

He could not go back to his work leaving matters in this uncomfortable condition. He made up his mind to speak plainly to Lady Eugénie in the morning and do his utmost to get at her views, and, if possible, to get from her a straight answer to a straight question.

He looked grimmer and gloomier than ever when he presented himself.

'The doctor has just been,' said her ladyship. 'I laid the matter before him quite plainly, and he threatened me—actually threatened me, Geoffrey—with pains and penalties which I tremble to think of, if I suffered her to undergo any disturbance whatever.'

'But surely it would not disturb her to see me, Lady Eugénie, and to hear from my own lips that everything is all right.'

'I urged it as strongly as I knew how, and he said he would not be answerable for the consequences. He considers her in a very critical state altogether.'

What was he to do? He could hardly urge the matter further, and yet—and yet—well, he had his doubts of Lady Eugénie.

He had been trying his best to see his way in the carpet. Looking up suddenly, he caught sight of her ladyship's face in the mirror of a corner cabinet, and there was something in it that caused him to turn upon her with startling abruptness.

'May I ask you a very plain question, Lady Eugénie?'

'Certainly, Geoffrey.'

'Is it true that you are desirous of breaking off relations between Una and myself?'

'Who says so?' she asked quickly.

'I have heard so, but I would not credit it. Is it so?'

'I do not go so far as that, Geoffrey; but for the present at all events the matter is beyond discussion. Una is not in a fit state to'——

'Does she know I am here?'

'Yes.' And the recording angel surely made a big black mark against her ladyship's name at that, for Una knew nothing whatever about the matter.

'And she has expressed no wish to see me?'

'She has no wish at present except for absolute quiet.'

'It is no good my waiting, then, in hopes of seeing her?'

'I am afraid not. The doctor says it will be some considerable time before she will be able to'——

'Thank you,' he said quietly. 'Then I think I need not wait. I will wish your ladyship good-day—and, I think, good-bye;' and he bowed and went steadily out—to a blank world that held nothing of interest for him—nothing, except a wide blue river and baking yellow sands, and the crackle of guns, and strenuous fighters in patched *jibbahs*, and the chances of welcome death.

Ellen eyed him anxiously when he turned up at the house again, and her face was full of wistful questioning.

He shook his head and answered her briefly. 'I did not see Una. Her mother says her nerves have given way and she is not in a fit state to see anybody. I judge from her ladyship's manner that she has decided that I have forfeited all claims on her daughter.'

'It seems hard, Geoff dear. But do you not think—— Did Una know you were there?'

'Her mother said she did.'

'And she sent no message—nothing?'

'Nothing.'

'Then, Geoff, you are far better to be quit of her,' said placid Ellen hotly. 'That is not how a girl loves, if she loves at all. Do you think I would give up Charlie like that, no matter what had happened to him? She is shallow, Geoff. I feared it always, and now I know that I always knew it. And as for Lady Eugénie'—— Words could not express it. 'It may be the saving of you from lifelong misery, Geoff,' she continued. 'Far better to learn it before marriage than after. Please God, you will, in the proper time, find a girl worthier of you than Una ever would have been. Oh, Geoff, Geoff!' —and she put her arms round his neck at sight of his gloomily set face—'don't go and get yourself killed for her sake. She is not worth it, my dear; she is not worth it. Promise me, Geoff! Your face frightens me.'

'I will go away at once, dear, and I will do my duty, whatever it please God to send me. If it is death, I do not think I shall regret it very greatly.'

He and the General sat talking late into the night—the old gentleman forecasting some of Geoff's coming difficulties, and giving him such advice as his experience suggested.

'Take it all quietly, my boy,' he said. 'Show no resentment, whatever you may feel. And when the fighting comes, you will show them the stuff you are made of. Mind you, I don't for one moment suppose any one of them really doubted your courage. All that was simply a blind to throw dust in our eyes over here, and to saddle you, instead of themselves, with any blame that might be going. Your Colonel will ride the high horse, of course, for your going back cleared is a smack in the face for him. But don't show that you feel it, my boy. But there!—I'm talking as if you were an unlicked cub, and you've borne yourself all through this matter like a man, where some would have blown their brains out. I have perfect confidence in you, my boy, and sometime you'll know it.'

He was referring to his will, and Geoff knew all about that, or thought he did.

'I know it now, sir, and I don't want to know it any other way. Ellen will be very happy with Doone, I think. He is a splendid fellow, and their hearts beat time perfectly, it seems to me. I suppose he will be Exmoor before I get back. Ellen will be the best countess they have had for a long while. She does us credit, sir.'

'She's a credit to humanity at large, my boy. I don't suppose even I know all she does for people, and I see a good deal. She does much that no one ever sees except the folks themselves. You should hear my fellow Brading talk of her.'

'Brading won't last long, from what you were saying.'

'Not long. But he's perfectly happy, and hasn't a care on his mind. I only know of one thing he'd like, and that is that you would run round and shake him by the hand before you go. His youngest boy is at the front.'

'In the Fusiliers. I remember. I'll go round first thing in the morning, and get off by the midday train. You won't feel hurt at my running away again so soon, sir?'

'Not a bit, my boy. Your place is at the front, and duty calls.'

A LADY-TRAMP IN CHINA AND JAPAN.

By Margaret Innes Pollock.

SECOND PAPER.

AT Vancouver I stepped on board a Canadian Pacific Railway steamer bound for Hong-kong, with a stop-over on my second-class ticket—which cost about twenty-three pounds—for Yokohama. Baker Mountain was lost sight of as we steamed out of the bay. Victoria was passed in the dark, and by next morning there was nothing but the gray waste of waters all around. Strong head-winds delayed us so much that we lost three days on the voyage—which was trying, as I should have had nearly a week in Japan before the following steamer, *The Empress of China*, was due. Knowing the weather we had encountered would not hinder *her* progress, within an hour after landing I was off in the train for Nikko, being desirous of seeing the famous temples there. A fellow-passenger helped me to procure a ticket, and also ascertained that I had to change at two junctions. One of these, I understood, was at the first place we came to, so when the train stopped I prepared to alight; but, not being sure if I was right in doing so, I beckoned to the guard. Here, to my amusement, I found that neither he nor any one else understood English. In my perplexity I was greatly relieved to hear a voice behind me saying, 'Can I be of any assistance?' An English doctor happened to be in the next compartment, and had come to the rescue. Not only did he tell me that this was merely a

suburb, but kindly wrote down the names of the junctions, and finally gave me his card with a request to the proprietor of the Nikko hotel to give me a room at a moderate rate.

The journey of one hundred and twenty miles was most enjoyable. Of course I went third class, only paying about three shillings for the ticket. Unfortunately it was not the season for flowers; but the flat country through which we passed at first was variegated with different crops. Whenever I was tired of gazing out of the window, my fellow-passengers were a study. Their *kimono* seemed a comfortable garment, and the broad band or sash of the women, according to the way in which it was adjusted, indicated whether the wearer was married or single. The glossy black hair of both matrons and maidens was beautifully dressed, with a flower, pin, or other adornment stuck artistically amongst the braids. Sometimes stockings were worn; sometimes the small feet were only encased in shoes or high-heeled sandals, which they kicked off if they wished to curl themselves up in a corner of the seat. Both men and women seemed bright, alert, and good-natured. To me as a foreigner they were kind and polite.

Just as the hills were coming into sight it grew dark, and it was nine o'clock when Nikko was reached. On alighting I saw two men holding Chinese lanterns, the light inside showing the word 'Nikko' on one. Taking for granted that this was the hotel porter, I addressed him, but here again found there was no way of coming to a mutual understanding. In this new dilemma how thankfully did I hear the question, 'What do you want?' My good fairy, who always turns up when required, appeared on this occasion in the guise of a Japanese stationmaster who spoke English fluently. He acted as interpreter between me and the porter, who mentioned the terms at the hotel, adding that he had no authority to reduce them. As these were too high for my purse, the stationmaster suggested a boarding-house. This exactly suited me, as the charge, including food, was only two shillings per day, and I knew I should see something of Japanese customs. My obliging new friend wrote a note, hailed a 'rikisha, and showed me the coin to give the 'boy'—about sixpence—which was double fare, owing to the lateness of the hour, and seeing that he had to pull me up a long, steep street.

When the 'boy' stopped at the wide entrance I presented my missive, and, from the signs made, understood I was welcome. A man-servant came forward and took off my dusty shoes, providing me with slippers to walk along the polished passage to the room which I was to occupy. Here, to my surprise, I found a few articles of European furniture: table, chair, and washstand with basin and ewer. Freshly infused tea and grapes were brought, and I suppose they asked me if I wished anything else; but, as I had no idea what their questions meant, I shook my head. Not knowing what Japanese food would be like, I had brought a tin of meat and biscuits with me.

Then a man appeared bearing a large quantity of quilts which were piled one on the top of the other. Muslin sheets were added, and above these one or two more quilts, till, behold, a comfortable shake-down! Locking my door was impossible, for the simple reason that there was no door and no lock. Two sides of the room were of wood; the other two consisted of sliding panels, something like window-frames, from top to bottom, with small panes of opaque paper instead of glass. Presently the house became quiet, and I extinguished my candle and lay down, wishing I had a friend with me to enjoy the novel situation.

In the morning I saw an eye peering through a rent in the paper pane on a level with my head, which suggested the idea that I had better dress before the household gathered to watch the process in turns. A little maiden was not long in bringing me tea and fruit; and when I emerged I found, on the other side of the passage, one of those miniature gardens which are so common, with a rockery, and a tiny rivulet running through it.

When I appeared in the shop, through which you had to pass to the street, I found that a sailor, who had learnt English on board a man-of-war, had been hunted up to act as interpreter. He procured a guide for the temples, which are scattered over a considerable space of ground, one being especially gorgeous in colouring, gilding, and carving. There were hideous images at some of the gates, but apparently none inside the buildings. The priests here and there were going through a form of worship; but I could not spare time to note in what this consisted.

After being surfeited with temples I returned to the boarding-house, paid my bill, and wrote my name in the English visitors' book, which was proudly produced for this purpose. There were only three entries in it, the last signature being that of a gentleman from Boston, who had been there two years before. If any one wishes to find the establishment, he may discover it by a legend over the entrance in which the words 'English cooking' occur. Before leaving I asked the proprietor, through the interpreter, if he could tell me of a similar boarding-house at Tokio, and he recommended one near the Uyeno Station, giving me a card in Japanese, which, of course, I could not decipher.

After thanking the stationmaster for his helpful kindness, I departed by the midday train. In the sunshine the scenery was lovely. The hills had a soft, velvety appearance, with the houses peeping out every here and there among the trees, reminding me of pictures on rice-paper, and endless paths were visible, which I longed to tread. Then I noticed the stretch of road lined on each side with cryptomerias. I was told these at one time extended in an unbroken line for miles, but now there are gaps, and the railway crosses the road more than once.

These trees have such a sombre, almost mournful aspect that my fancy pictured them as a stately guard of honour stationed at close intervals to keep the route clear while some magnificent funeral cortège passed along. What with the beautiful views, the curious incidents noticeable at the station, and my interesting fellow-passengers, the journey did not seem long or tiresome. I myself was evidently an object of curiosity and the subject of conversation; unmistakably so when I produced a bottle of cold, pale-coloured tea, and heard the word 'Whisky' uttered by more than one person. I felt ashamed and grieved to find that they could imagine an English lady would indulge in such a thing; so I poured some into a cup, and begged the little woman sitting next me to smell it, and at last persuaded her to taste it, when she immediately corrected the erroneous impression, and a chorus of voices exonerated me from the sad imputation. Alas! I do not wonder that it arose, as boards advertising English liquors were to be seen along the line.

When I drew near Tokio I showed the introduction which I had received at Nikko to a student with whom I had been talking. With the utmost courtesy he at once offered to conduct me to the boarding-house, and insisted on carrying my bag. Here I again got a thoroughly clean room with a balcony overlooking a large square. The house was ransacked for English furniture, but one old chair was all that was on the premises. There was no provision for ablutions in private. I had to descend to the bath-room, where I was furnished with water in a well-scoured tin basin, and a saucer containing salt for my teeth. The operation was visible to any one going along the passage, but did not attract notice. Even before tea could be infused, a brazier filled with ashes and a pipe with a miniature bowl were brought; but as I had not acquired the habit of taking a whiff like some Japanese women, I motioned them away. To all interrogations I replied with the negative sign, except once, when I nodded just to see what the result would be, which was the appearance of a tin flask of *bouillon* and a raw egg.

At the railway station food could be had; and as the bill of fare was printed in English on one side and in Japanese on the other, under the same numbers, by my pointing to this the waiter understood what was ordered.

One of the two days I spent in Tokio was a Sunday, which I thought I would spend quietly in the parks. Not coming across a well-known temple, I tried making inquiries for it by signs. I put my hands together, closed my eyes, and bowed my head, and then pointed to the paths leading in various directions. One was indicated, which I followed till it came to a small church, which I quietly entered by the wide-open door. Here was evidently a Christian congregation, with whom I was glad to worship in spirit. The singing was very sweet and the building well filled.

On the second day I saw as much as I possibly could. The large statue of Buddha confronted me soon after entering the Uyeno Park, and I knew the Zoological Gardens were not far off. On my asking two boys where these were they at once closed the French grammar over which they were poring, saying to each other, 'She is a stranger; let us be her guides;' and I had difficulty in persuading them to continue their studies. Later in the afternoon, when I was standing on a height overlooking the town, a young fellow at my elbow respectfully begged permission to inquire what my nationality was. He was evidently glad of the opportunity of airing his English, and offered to show me the way to the Botanical Gardens. I had an interesting talk with him, and he returned to the boarding-house to act as interpreter. On my thanking him, he told me when I was in any difficulty to apply to the students, as they were always glad to be of use to strangers.

This being my last evening, I thought I would risk a Japanese meal, so I descended to the place where the cooking went on, and soon had the whole household standing round me in fits of laughter while I made a selection of eatables. On their lifting the lids of the pots I signified that I would have rice for a foundation; then they held up a creature which looked like a huge starfish, a tentacle of which I declined; but I got a slice of fried fish and one or two morsels of unknown vegetables. These were put into little dishes, and, being ornamented with sprigs, placed on a lacquered tray and carried in triumph to my room, where the proprietor's gentle little wife, as she had frequently done, came and sat down on the floor beside me to observe my mode of eating. The food was good, and had I known sooner that it was so palatable I would have partaken of it freely. I was much amused with the salaams of all in the house, the man who brought the quilts for the shake-down almost touching the floor with his forehead.

Early in the morning I paid my modest bill of four shillings, and got into a 'rikisha which was waiting at the door. The sturdy 'boy' kept up such a good pace the whole way across the town that I caught an earlier train than I had intended, and in two hours reached Yokohama. The *Empress of China* was already anchored in the harbour; but as she was not to sail till the afternoon, I had time to inspect the town, which did not seem nearly so interesting as those I had just visited. While the *Empress* was lying at Kobe and Nagasaki I went ashore and climbed the slopes to see the country. The agriculture was interesting. The ground was divided into small patches, where rice, yams, and other crops which I did not recognise were growing. One's walk was considerably lengthened by the footpaths at the edge of the fields winding up and down and round about in a tantalising manner; but higher up I emerged on a grassy space, whence I descended by a broad road underneath trees. Unfortunately, while we sailed through the Inland Sea it was gray and dull.

In sunshine it must be exquisite. Little did we think that the eyes of all the world would so soon be upon Japan and the plucky little people who at present are engaged in the horrors of war.

After a good run the *Empress* anchored at Woosung, and we were conveyed up the river in a steam-launch to Shanghai. On my way to and from the China Inland Mission House I passed some of the fine buildings along the Bund, but had not time to see much more.

It was a clear, sunny morning when we entered the beautiful harbour of Hong-kong. The hills all round, culminating in the Peak, the handsome hongs and other buildings, with the endless variety of shipping, from the man-of-war painted a leaden hue to make it as unobservable as possible, down to the frail sampan, produced a striking impression.

As I was bound for Swatow, which we had passed but did not touch at, it was rather provoking to meet the coasting-steamer. A missionary's wife, with four children, was equally anxious not to spend a night in Hong-kong, so we went from one shipping-office to another till we discovered that a cargo-steamer, in which, although passengers were rarely carried, there were two available cabins, would sail in three hours. We hailed a sampan and told the boatmen to row us to the said vessel. I supposed the rowers were men, but it turned out that half were women; the dress of the men and women, consisting of loose, dark-blue trousers and shirt worn outside, being very similar. These boatmen's families often live on their craft. When the children are so small that there is a risk of their tumbling overboard they are tethered by means of a rope, so that it is easy to pull them out of the water!

The chief officer and steward were rather surprised when we boarded the *Hupeh*, but they treated us well. The Chinese 'boy,' No. 1, actually prepared a menu card for dinner, which was creditable as well as amusing. Among the items were 'joints, haricot mutton; entrée, tinned sausages'!

We had a smooth passage lasting one night. I was not expected at the E. P. Mission, Swatow, but received a warm welcome. If I were writing for a missionary magazine I could fill pages with an account of the interesting and fruitful work I saw here. Fine new hospitals, to replace old ones, were nearly finished, and young Chinese women were receiving elementary medical instruction from a lady-doctor.

A friend took me both by daylight and lamplight through the narrow, crowded streets, with shops on either side containing an endless variety of wares. In some the men were gambling. On a waste piece of ground an open-air theatre had been erected, the play being enacted on a platform. In fact, it was equivalent to an advertisement, as it was used to draw a crowd, who were sure to make purchases at the stalls around. I was inside a deplorably dirty Chinese house: such a contrast to the clean, tidy homes in a Christian village. As I was accompanied by a native woman, no objection was made to my entering a temple and an ancestral hall containing memorial tablets. Chinese ideas about death, even apart from ancestral worship, are singular in many ways. I heard of a girl who was anxious to give her mother an acceptable present, and therefore selected a coffin!

My walks in the surrounding country were limited, as I did not like to risk encounters with savage dogs; but two of my busy friends spared an afternoon for a delightful scramble over the hills on the opposite side of the bay, reached by a small boat which danced over the waves.

Five days sped all too quickly, at the end of which I returned to Hong-kong. Here I heard of a steamer which was to sail for Culcutta that afternoon. All the second-class berths were already engaged; but when I told the company's manager I could not afford more than second-class fare, he gave me a first-class passage for six pounds ten shillings—one of the many kindnesses I experienced, for which I shall ever be grateful. I was the only lady on board—which was not the first time this had happened—and for once travelled luxuriously. From several captains have I received special favours during my wanderings; but the captain of this steamer exceeded even the others in thoughtful consideration. I feel tolerably at home now in stoke-holes and refrigerating chambers, bakeries and barbers' shops; but there is always something new to be seen when one goes round a vessel, so I was delighted when the first officer took me over the ship, and the chief engineer to the infernal regions below, not forgetting to conduct me to the end of his ball-room, as he called the long, tunnel-like chamber in which was the enclosed shaft of the propeller.

When we reached Singapore we landed twelve hundred Chinese coolies. On lying down at night on deck they seemed to occupy every foot of space, but were a contented lot. A Chinese compradore had the duty of catering for them, and they seemed well fed, though doubtless the compradore would earn a good percentage for himself on the transaction. They were quiet enough during the voyage, but became excited at landing, and in their eagerness to get ashore had almost to be kept back with sticks, otherwise the whole mass would have leaped upon the quay in one mad jump. Some possessed boxes; others seemed to own nothing but a fan or such-like article. Overseers were waiting to receive them, and they were marched off in detachments to work in the mines or to other employment.

A fellow-passenger took me to the Botanical Gardens, which are worth a visit; but the situation is not nearly so beautiful as that of the gardens at Penang, which are surrounded by hills, so that you do not know where the enclosure ends, and they have the advantage of a waterfall in their midst.

From Penang we went straight to Calcutta, where a new phase of my experiences began.

THE HAUNTED HAT.

By Professor HOFFMANN.

I HAD taken my evening repast, after my customary modest fashion, at the Hotel Benvenuto, a cosy little Italian restaurant in Soho. Lest the fact that I had been dining should, in sceptical minds, tend to cast a doubt upon the strict accuracy of the strange story which follows, I hasten to add that my potations had been limited to a flask of Chianti and a cup of black coffee.

I lighted a cigar and started to walk home. I should here mention that I am a bachelor, and occupy the drawing-room floor of a house not far from Euston Square. I had not gone many yards when my ears were assailed by a sound, faint but distinct, of hand-clapping. I was at the moment passing a theatre, and I imagined the sound to be the applause of the audience. I wondered, in a careless way, how it was that I had never heard it in the same spot before; but I concluded that it must be owing to some difference in the direction of the wind. Strange to say, however, after an interval of silence, the sound again became audible when I was not near any place whence it was likely to have proceeded. I know how easily a highly strung intellect like mine may be upset, and I began to feel a little bit nervous. Fortunately, almost at the same moment, I chanced to meet a medical friend. I described to him my curious sensations. 'Liver, dear boy,' he said; 'liver, without a doubt. Take a blue pill to-night and a seidlitz powder in the morning, and you'll be as right as a trivet.'

I thanked him; and chancing soon afterwards to pass a chemist's shop, I went in and purchased the prescribed remedies, after which I resumed my walk home and reached my 'diggings' without further adventure. In my sitting-room is an early Victorian piece of furniture called, I believe, a chiffonier, surmounted by a bust of Mr Chamberlain. I laid my hat beside the bust, and filling my pipe, sat down to read a magazine. I was half-way through an interesting article when the clock began to strike. I looked up, uncertain whether it was ten or eleven. As I did so I became conscious of a strange phenomenon. My hat, which I had placed crown downwards on the chiffonier, now surmounted Mr Chamberlain's head. It was tilted on one side in a most unstatesman-like manner, and an eyeglass, which I had never noticed before, was stuck in the right eye of the figure. Even the expression of the bust was changed. In its normal condition it represented a grave and dignified personage, as one might picture Mr Chamberlain when expounding the advantages of reciprocity; but under his present aspect one would rather have expected from him a comic song or a smoking-room story. Such a libel upon a distinguished statesman was not to be tolerated for a moment. I hastily got up and removed the hat and eyeglass, when the bust reverted to its ordinary expression. As I did so, the mysterious hand-clapping again sounded in my ears.

Once more I trembled for my intellect; till I recalled my medical friend's diagnosis, when I began to feel equally anxious about my liver. Whichever it was, it was clear that I was in a bad way. There was only one thing to be done, and I did it. I went to bed.

On entering my sitting-room the next morning I instinctively glanced at the bust of Mr Chamberlain. It wore its normal expression of calm cocksureness, not in the least like the 'won't-go-home-till-morning' air it had borne on the previous evening, and beside it rested my hat just as I had placed it overnight. I breakfasted in usual course, and started for my office in Lincoln's Inn. I ought to have mentioned that I am a solicitor. The firm is Bramwell and Browne. Bramwell is the senior partner, and I am Browne.

On arriving I sat down at my table and began to open my letters. I had been thus occupied for about half-an-hour when the office-boy came in with a fresh batch. He looked at me with a curious expression, as if amused at something, and as soon as he had got outside the door I heard a sound of smothered laughter. A few minutes later another clerk came in. I noticed on his face the same expression of suppressed amusement, and again heard a choking sound when he got outside the door. I looked carefully around in search of anything to account for their conduct, but in vain. Shortly afterwards my partner came in. He too looked at me in a curious way. 'Going out?' he inquired. 'No,' I replied; 'not at present.' 'Then why have you got your hat on, and why are you wearing it in such an extraordinary way?' I put my hands to my head. I found that my hat, which I imagined I had taken off as usual on entering, was still on my head, but tilted backwards in a manner which quite accounted for the frivolous behaviour of our underlings. 'I—um—it slipped my memory,' I said, and taking off the hat, placed it on the table beside me. Again I heard the sound of faint applause. I glanced at my partner to see if he too heard it, but he made no sign.

The morning passed without further incident till after lunch, when I had arranged to meet my broker at the Bank of England in order to execute a transfer of stock. On arriving at the Bank I placed my hat on the counter beside me while I wrote my signature. There was certainly nothing in it when I laid it down; but when I took it up again to

replace it a grim-looking cannon-ball rolled out of it. Stock Exchange men are proverbially fond of practical jokes, and I glanced savagely at my broker, with the idea that he was somehow responsible for the phenomenon. His astonished expression, however, satisfied me that he was innocent; and the clerks behind the counter looked equally surprised, not to say alarmed. The situation was most embarrassing. The thing had unmistakably come out of my hat, and there was nothing for it but to account for its presence as best I could. I endeavoured to appear unconcerned, but it was a poor attempt. 'I—I didn't intend to show you that,' I stammered. 'It's a little scientific experiment of mine; an invention that may—er—have money in it. I am taking it to my—my patent agent.'

I could see that nobody believed me, and feeling, and I have no doubt looking, like a detected criminal, I picked up the wretched object and put it in my brief-bag, after which I hastily said 'Good-morning.' If I may judge by the expression of the faces around me, the general idea was that I had accidentally exhibited an infernal machine; and I have little doubt that it was only my known personality and my hitherto blameless character that preserved me from arrest on the spot. As it was, I have a conviction that I was 'shadowed' all the way back to the office by one of the Bank detectives. As I left the building I once more heard the strange sound of hand-clapping which had so worried me on previous occasions.

I went straight back to my office. On the landing outside the door is a wooden receptacle, half bin, half cellar, which serves to contain our coal-supply. I lifted the flap, and taking the cannon-ball out of my bag, dropped it in among the coals, only too pleased to be rid of it.

I hung my hat on its usual peg in the lobby, and tried to settle down to my work. In the course of the afternoon I had occasion to send a document to our law stationer's to be copied, and took it into the outer office for that purpose. I perceived at once that there was some disturbing element, for the clerks appeared to be attending to anything rather than their work. 'What's going on here?' I said sternly. 'Please, sir,' replied the shorthand clerk, 'it's the rabbit.' 'Rabbit! What rabbit?' 'We thought it was yours, sir.' 'Mine! What do you mean?' 'It came out of your hat, sir,' said another. 'The hat fell off the peg, and the rabbit came out of it.'

In view of my recent experience, the statement did not appear so incredible as it would otherwise have done, and as he spoke I perceived that a small rabbit was dodging about among the legs of the office stools. This time, however, I could safely disclaim responsibility. 'It seems to me, gentlemen,' I said, 'that some one is playing practical jokes. I won't inquire who it is' (I knew I had better not), 'but if it occurs again I shall deal with the matter very severely.'

I returned to my own room and proceeded with my work as best I could. From the subdued chuckles which I heard in the outer office at intervals, I fear that the rabbit interfered a good deal with the serious business of the afternoon, and I was not sorry when office hours were over and the clerks dispersed to their respective homes.

I had arranged to dine with a friend at his club. I was half-inclined to confide in him, and take his opinion on my singular experiences; but I felt that it wouldn't do. M'Brayne is the sort of man who prides himself on the very few things he believes. I felt that if I told him my story he would set me down as either a liar or a lunatic, possibly both. My mind, however, kept recurring to the subject during dinner; and my host chaffed me more than once about my absent-mindedness. Towards the close of the meal a terrible thought struck me. What if the object which I had taken to be a mere cannon-ball contained some violent explosive? And, good heavens! I had deposited it in our own coal-bin. I felt a horrible presentiment that the good lady who looks after our office would choose that particular 'lump' the very next morning to place on one of the fires; in which case not only might she blow herself up, but one side of New Square might be in ruins, and whole pages of the *Law List* out of date by reason of the untimely death of the rising barristers and eminent solicitors whose names had hitherto adorned them.

And if the wretched thing did go off *I* should be held responsible. Not only my stockbroker, but sundry Bank of England clerks, equal in general credibility to bishops, had seen it in my possession and heard my lame account of it. The possibility was not to be tolerated for a moment. By hook or by crook I must regain possession of that cannon-ball or bombshell, or whatever it might prove to be.

I took a hasty leave of my host (who did not seem pleased at my sudden departure) and made my way back to Lincoln's Inn. I had never been there at night before, and I had an uneasy consciousness that the porters eyed me with suspicion. I didn't wonder at it, for I felt like a burglar; indeed, a real burglar would probably have been much more at his ease. I proceeded to our staircase. The stairs creaked as they never creak in the daytime, but in due course I reached our landing. To my great discomfiture, it was in all but darkness. There was a feeble gas-jet on the floor below and one on the landing above, but none on ours. I lifted the lid of the coal-bin, and by the aid of a wax-match peered into its grimy recesses. The object of my search had apparently rolled into some remote corner, for I could not see it. I draw a veil over the difficulties of my search; no description could possibly do them justice. Suffice it to say that after actually getting into that coal-bin, burning the best part of a box of matches, and ruining a nearly new pair of trousers, I secured that wretched ball, and returned it, with infinite precaution, to my brief-bag. It looked harmless

enough; but I dared not take any chances. What was I to do with it?

After a little reflection I decided for Waterloo Bridge, and I hastened in that direction. Watching my opportunity, I opened the bag, took out the cannon-ball, and dropped it into the stream below. 'Thank goodness! that 's done with,' I soliloquised as I heard the splash. No one appeared to have observed my strange proceedings, and I made the best of my way home, accompanied by the faint ripple of applause in my ears, which by this time I was beginning to be almost accustomed to.

I slunk into my rooms, fortunately without attracting observation, and set to work to remove the grimy traces of my night's adventures. I glanced at Mr Chamberlain, half expecting a renewal of the previous evening's frivolity. It seemed to me that there was a sort of twinkle in his plaster eye, as if he were aware of and enjoyed my recent experiences, but there was no other manifestation. The following day was Saturday. The morning passed without any abnormal occurrence, and in the afternoon I took advantage of the customary half-holiday to pay a visit to a lady whom I hope shortly to make Mrs Browne. My *fiancée* resides with an elderly aunt, of strict Presbyterian principles and by no means easy to get on with. Miss MacTaggart holds permanently the opinion which King David expressed in a hasty moment, that all men are liars. Indeed, she goes further than David in her poor opinion of the male sex, who, according to her, are, with very few exceptions, gamblers, whisky-bibbers, and general evil livers. I had had considerable difficulty in persuading her that my moral character was a little above the very low average. I think the point which told most in my favour was the fact that I am one of the very few men who do not play bridge. Indeed, I very rarely touch a card at all, my favourite recreations being golf and chess, to neither of which she could find any serious objection. She happened, to my secret satisfaction, to be out driving on the occasion of my visit; and as I gathered that her return was expected at five o'clock, I mentally resolved to make my adieux ten minutes earlier.

The time passed only too quickly. Several times in the course of the afternoon I had been on the point of confiding to Ethel my strange experiences of the previous day; but the fear of being disbelieved prevented me, and when I rose to go my tale was still untold. But my lack of moral courage brought a heavy punishment. I had brought my hat with me into the drawing-room, and placed it on a chair. When I took it up again to go, it struck me as being unusually heavy. Glancing down into it, I perceived that it was nearly filled by something or other loosely wrapped in a red cotton handkerchief with white spots. 'Good heavens!' I exclaimed, as I realised that I was in for some new embarrassment. 'What in the world have you got in your hat?' said my lady-love. 'Upon my word, I don't know,' I said desperately. 'There was nothing in it when I came in, I 'll take my'—I was going to say 'oath,' but professional instinct made me substitute 'affidavit.' 'You surely don't mean to suggest that anything has been put into it since? No one has come into the room but the parlour-maid, and I 'm sure she never went near your hat.'

Ethel's logic was unanswerable. Nothing could possibly have got into my hat, and yet something had certainly done so. 'We will see what it is, at any rate,' I said, assuming a confidence I was far from feeling. I untied the handkerchief. It was full of playing-cards, not in separate packs, but a mixed lot of all sorts and patterns, some of them fairly new, but the greater part more or less soiled and dog-eared. 'Oh Arthur!' exclaimed Ethel in tones of horror; 'and I thought you never played cards.' 'Nor do I; and if I did, you surely don't suppose I would use such a grubby lot as these?' 'Then why,' she sobbed—'*why* do you carry them in your hat?' I tried to explain that I had nothing to do with the matter—that various supernatural things happened to me without any volition of mine. Naturally, she didn't believe it. Her faith in me was shattered, and my attempts at exculpating myself only made the matter worse. 'Oh, never mind all that!' she said impatiently. 'Please put away the wretched things, and get away before Aunt Priscilla comes home, or it will be all over. I shall never be allowed to speak to you again.'

I felt that for the time there was nothing else to be done, and I forthwith began to stow away the cards again. They had been packed, I suppose, with some amount of system; for in my haste, and in their now more scattered condition, I found it impossible to get them back into the handkerchief. I filled every available pocket. My garments were distended in every direction by objectionable bulges. At last I succeeded in reducing the remainder to such a quantity as would just go into the handkerchief; but here a further difficulty presented itself. Nothing would induce the package thus made to go again into the hat; and I had finally to take my leave (happily just in time to escape Aunt Priscilla), carrying the distended handkerchief in my hand, as a navvy carries his dinner. And this in one of the most fashionable squares of the West End!

Luckily, there was a hansom in sight. I hailed it, keeping my objectionable parcel well behind me, and jumped in, stowing my burden under the seat. I was about to tell the man to drive me home, when a happy thought struck me. I would make him a present (without his knowledge) of the pocket-handkerchief and its contents. I accordingly told him to drive me to Gower Street Station. When I reached it I got out hurriedly, leaving the parcel behind me, gave him a liberal fare, and took a return ticket for Moorgate. I jumped into an empty compartment, and as soon as the train had started, opened the window and began to clear my pockets of their objectionable contents. There were

paragraphs in the papers the next day mentioning the curious fact that the permanent way from Gower Street to Moorgate had been found strewn with playing-cards, and propounding various theories, all equally wide of the mark, to account for the extraordinary phenomenon. But I did not contradict them.

Having completed my task, I started homeward, congratulating myself on having made a clean sweep of my encumbrances. But I reckoned without my host, or rather without my cabman. A hansom was standing before my door. It appeared that the Jehu knew me by sight, having driven me home once or twice from a theatre. Having found the parcel under the seat, he had come, with inconvenient honesty, to restore it to me. With a smile upon my countenance but imprecations in my heart, I gave him a liberal reward for his trouble, with a further allowance for the hour or so which he had lost in waiting for my arrival.

Fortunately there was a fire in my grate, and as soon as I had got fairly into my rooms and closed the door I set to work to burn those detestable cards. I could not have believed that it would be so difficult a task. The more I burnt the more there seemed to be left, and the smell was atrocious. Half-way through the operation there was an agitated knock at the door, and my landlady rushed in, carrying a pail of water. She justified her sudden entrance by a tremendous sniff, and the remark that she 'reely thought the 'ouse was afire.' 'It is all right, Mrs Jenkins,' I explained. 'I am merely burning some—some papers.' Unluckily, that villainous red handkerchief lay open on the hearth-rug. It still contained a goodly quantity of cards. Some were scattered over the carpet, and others in various stages of combustion choked the fireplace. 'An' a very noble thing on your part, if you 'll excuse me sayin' so, Mr Browne. I 'ope an' trust you 're a-givin' of 'em up for good, an' I only wish all young men 'ad the moral kerridge to do the same. If my poor 'usband'—— But I had already heard, on various occasions, of the weaknesses of the late Mr Jenkins, and I had no inclination that he should be further utilised to point a moral at my expense. I cut her short. 'You are quite mistaken, Mrs Jenkins,' I said. 'These cards do not belong to me. I am destroying them for—for quite a different reason.' 'Then you 're a-takin' temptation out of the way of some other young feller, an' I call it very noble; very noble on your part. I do, sir, indeed.'

This was the last straw. It is bad enough to be suspected of a vice of which you are not guilty, but to be credited in a grandmotherly sort of way with a virtue to which you have no claim is even more exasperating. 'Thank you,' I said. 'Now that you have satisfied yourself that there is no danger of fire, perhaps you will kindly leave me to my occupation. When I want anything I will ring.'

The good lady took up her pail. 'Ho, certinly!' she said, and left the room with an even louder sniff than that with which she had entered it. I returned to my abominable task. I could almost have imagined that those cards and that handkerchief had been chemically rendered incombustible. But they were at last reduced to ashes, and after a very necessary wash I was free to go to my dinner. I wavered between the Trocadero and the Benvenuto, but finally decided for the latter.

I was just looking over the *carte* when the head-waiter approached me. 'You were here the evening before last, Mr Browne. I suppose you didn't happen by mistake to take away another gent's hat?' 'Certainly not, to my knowledge. But the point is easily settled. Mine is a Lincoln and Bennett.' I took it down from the peg to show the makers' name. When I glanced into the crown, however, I perceived, to my surprise, that no name was visible. The spot where it should have been seen was occupied by a medallion representing the head of a demon or satyr wearing a cheerful grin, as if he were chuckling over the mistake that had been made. 'You are right; this is certainly not my own hat, though until this moment I had not noticed the difference. Who is the owner of this one?' 'Rather a distinguished party in his way, sir. It belongs to Herr Blitzen the conjurer, who is performing at the Empire, and this is the hat he uses in his famous trick of the *Chapeau du Diable*. To my mind, one tall hat 's very much like another; but he don't seem to think so. I 'm told he has had to cut out the trick for the last two nights for lack of this particular hat, and he 's been in five times to know if we had any tidings of it. I can't see anything very special about it myself'—and he turned it over in his hand—'but he says he wouldn't part with it for a hundred pounds. Ah! here he is.'

As he spoke a gentleman entered, whom I remembered to have seen seated near me on the occasion of my last visit. He was unmistakably a foreigner, presumably a German Jew. He was very dark, with an aquiline nose and unusually piercing eyes. His most noteworthy features, however, were the eyebrows, which, either by nature or art, were bent upwards at their outer ends. The ends of his moustache were bent upwards in the same manner, the combination giving him a Mephistophelean expression singularly appropriate to the nature of his profession. He caught sight of the hat in the waiter's hands, and seemed to know instinctively that it was his lost property. He almost rushed towards us. 'Aha! you find my hat?' 'Yes, sir,' said the waiter. 'This gentleman had took it by mistake.' Herr Blitzen bowed politely to me, and took the hat from the waiter's hands. 'I am much glad to find him once again;' and he smoothed it tenderly with his sleeve. 'I hope he give you no trouble, sare.' 'Oh dear, no,' I said. 'It 's no trouble at all, so far as I am concerned. The fault was mine. I am only sorry to have inconvenienced you by my mistake.'

He handed me back my own hat with another polite bow, and we sat down at different tables to our dinners. But half-way through my meal a startling idea struck me. When the magician expressed his hope that I had had no trouble with the hat, I had taken the remark to apply to the mere fact of the exchange, but I now perceived that it was capable of quite a different interpretation. Why, I had had nothing but trouble ever since it had been in my possession, and I now began to realise that that wretched hat, and nothing else, had been the cause of all my embarrassments. The mysterious sound of hand-clapping which had so worried me at intervals was doubtless its way of congratulating itself on the successful accomplishment of some new act of villainy.

I took a sudden resolve. As soon as I had finished my dinner I went round to the Empire Theatre and secured a stall to witness Herr Blitzen's performance. In due time his 'turn' came. He did sundry wonderful things, which, however, I have seen equalled by other conjurers. But at last came his special feat, the much-advertised *Chapeau du Diable*, and that was truly a marvel. Exhibiting a hat—*the* hat—he showed it empty, handing it round that there should be no mistake about its being so. Then, for some twenty minutes, he proceeded to take various articles from it. He began with such small matters as flowers, cards, and ribbons; but these were merely introductory. Soon, in rapid succession, came cannon-balls, rabbits, clocks, bird-cages, ladies' hats, lighted lanterns, and even soda-water tumblers and champagne bottles, till at the finish he had completely filled all the chairs and tables on the stage.

I heard two men behind me explaining to each other 'how it was done:' how the articles to be produced are stowed in the performer's pockets, and up his sleeves, and inside his collar, and down his back, and in all sorts of possible and impossible places, and how 'the quickness of the hand deceives the eye;' how the wizard puts them in the hat when you are not looking, and takes them out again when you are; and so on.

But I smile at such childish explanations. I know better! I have worn that hat!

A MEMORY OF AN OLD YOUNG AUTHOR.

By W. W. Fenn.

THERE came into my hands lately a new edition of an old book; and when I heard its name it gave me pause, for was it not an old friend and the work of an old friend? Full fifty years have passed since we met. This, then, was fame indeed—fame for a modern author, I mean. That a book should be sufficiently popular after the lapse of fifty years to make it worth a publisher's while to reprint it indicates great capacity in the writer for hitting the taste of the public, and great ability in the art of story-telling. I am glad that in this case this should be so, for the author of *Frank Fairlegh* was what I may call my first literary adviser. Moreover, he was a remarkable man, remarkable as an instance of what pluck and endurance can do in the face of the most direful physical obstacles.

There is a queer, haunting poem by Charles Lamb. It is well known, and is the very simplest thing in the world, and yet its plaintive sweetness re-echoes in one's mind after finer pieces have been forgotten:

> I have been laughing, I have been carousing,
> Drinking late, sitting late, with my bosom cronies.
> All, all are gone, the old familiar faces.
>
> . . . . . .
>
> I had a friend, a kinder friend had no man.

But the rest of this last verse does not apply to me, for Frank Smedley was my friend until came the Terminator of Delights and the Separator of Friendships—my friend always. That he died young is not to be wondered at in the face of his physical infirmities. But he left his mark—an enduring mark too, it would seem, since the book I refer to has just been republished, and I have every reason to believe that Frank Smedley's other works, *Lewis Arundel* and *Harry Coverdale's Courtship*, are still read by the rising and risen generations. These strenuous, breezy books, full of gay, leaping life, potent to charm away melancholy and make one feel what a jolly fine country our Old England is after all, are only equalled and barely surpassed by Charles Lever's best romances. Don't we remember the lad who was turned from a milksop into a man by reading *Charles O'Malley*, and don't we remember the black horse's leap over the old pit and his wild gallop in *Frank Fairlegh?* I am pretty sure that every schoolboy of the last generation read Frank Smedley's books with joy and profit; and, as I say, I think they do still.

Doubtless they all picture the author as a powerful Guy Livingstone of a man, instead of the poor crippled, stunted specimen of humanity that he really was. How he acquired the knowledge which enabled him to depict with absolute veracity such events, situations, and characters as are to be found in his stories was a wonder to all who knew him. It must have been by the intuition of something very like genius; and naturally his family and intimates settled it so, and I entirely agree with the explanation.

To my memory he is one of the most wonderful triumphs of mind over matter. His head was firm, his brow broad and high, his eyes luminous with mental fire. But he had little or no chin, though this deficiency was partially hidden by a carefully

trimmed beard and moustache; his neck was so stiff and short that he could not turn his head; his arms so short and crippled, his poor fingers so cramped and deformed, that at meals he had to use a fork of unusual length made for him specially. He was always seen sitting upright in a wheeled chair, for his legs were perfectly useless; in fact, physically he was but half a man. But his brain was as clear as a bell; he was a most fascinating talker and very fond of society, especially that of pretty women.

His parents, of course, did much to lessen the hardness of his lot. His mother was a rich woman; and his father, a tall, handsome, sportsman-like man, was a lawyer of the old, high-class conveyancing set, holding the office of High Bailiff of Westminster. They lived in Jermyn Street when first I heard of them, in the old-fashioned way of the man of affairs, the office being on the ground-floor, and all the rest their private house. Afterwards they moved to Grove Lodge (now The Grove), near St John's Wood Chapel. It was a fine mansion, with its rear upon a lovely sloping garden which had a private gate leading on to the canal. My introduction to the family was through Edmund Yates, who was a very close intimate of theirs, and who had often felt the solid value of their friendship. My affliction was beginning to steal upon me at about that time, and I was thinking of taking to literature, since that can be done by proxy when the eye cannot guide the hand. I saw Frank clearly enough before that happened, as the daylight left me gradually. When the doctor's pronouncement had gone forth, and I was in very low spirits, Frank gave me that sort of counsel and help which puts fresh life into a man. He made suggestions of subjects; he made me write, or rather dictate, upon them; he criticised my efforts into printability. Later, I was introduced to Strahan the publisher through his cousin, Miss Menella Smedley. Thus appeared, among other *Good Words* articles, the paper called 'The White Umbrella,' notable because of the illustration drawn for it by G. J. Pinwell.

My first literary consultation with Frank was at Brighton on the Marine Parade, in 1864, some years after I first knew him. I dined with him, and it was then that he first broached the question of writing. I told him I had already thought of doing so. I was then in the first gloominess which the blind man must pass through before he can fit himself into his limitations. Frank had a very large organ of tact and a very keen sense of humour. I was laughing and talking freely with him before I remembered that I was a man with a great darkness hanging over my head; and I suppose that in this kindly manner was I drawn out for literary examination, so to speak. Anyhow, after a little while he said, 'Why don't you write? Try and write, and let me see what you produce.' He had that stimulative influence which some call magnetism and others call a warm heart, and took life with great zest for himself and great sympathy for others. Like Cardinal Newman, for all his delicate build he was a fine judge of wines, especially of port. At his father's house in St John's Wood I had my best of that class of experience. I dined there often.

Here is the sort of invitation I used to receive frequently, and I venture to give it as a specimen of my good friend the writer's humour and elasticity of mind, equalled only by the terrible rigidity of his body:

'Grove Lodge, Regent's Park,
May 28th, 1857.

'Dear Fenn,—The Yates's and Albert Smith partake of our domestic mutton on Saturday next (30th). Will you also make one of the eagles around the carcass of ye fleecy brute?

'The doors open at 6.45; beards not objected to except by my mother, who would shave you by force if she could get a quiet half-hour with you alone!—Yours always, Frank E. Smedley.'

After his father's death, which happened in the quite early sixties, he bought a beautiful country-place near Marlow, where he lived during the summer; but he was not destined to enjoy it very long. He had been bright and cheerful as usual the previous evening; but in the morning, when his servant came to call him, he found him comatose. This condition was followed by epileptic fits, in one of which he died.

Poor fellow! the bright fire and vigour of his spirit were suddenly quenched. Had its casket been of an enduring quality, and had his circumstances not made him more than independent, who can say what number of stirring stories we might have had from his pen? As it was, his existence, life, and death added another to the many marvellous mysteries which are the eternal wonder of mankind.

THE COCKLER.

He is withered and tanned by the sun and rain,
But his bright eye sees afar,
Over the sands, through driving mists,
The flash of the hungry bar.
Day or night, when the sands are dry,
He follows his creaking cart,
Silent and stern, no laugh in his eye,
But ever one in his heart:
For he would not change his home on the sand
For the gaudiest palace in all the land.

Somewhere there, on the wind-blown waste,
His father and mother sleep;
Often he fancies he hears them call
To warn him of quicksands deep.
And he knows that the tide will come some day,
Roaring up from the sea,
When the wind is wild and the surges play,
And a lonely man stands he.
Then the merry winds shall pipe in vain;
He'll ne'er go out on the sands again.

SIXTH SERIES.

THE REVOLUTION IN THE BRITISH NAVY.

By ARCHIBALD S. HURD, Author of *Naval Efficiency*, *The British Fleet*, &c.

THE work of reforming the Navy, not merely in detail but in a radical and almost revolutionary spirit, is proceeding. Because little opposition has been made in public, it would be a mistake to suppose that the service itself unanimously approves of every aspect of the movement. There is no such unity of opinion; but officers of the Fleet, and even those who have retired from active duty, are so imbued with a love of the Navy and so jealous of its *esprit de corps*, which stands higher than that of probably any service in the world, that they have kept silence rather than encourage clamour. The Fleet has faith in those who direct its destinies. Is it not known as 'the silent Navy,' a body of officers and men banded together by no ordinary bonds, and practically without spokesmen in either of the Houses of Parliament? The reforms are being carefully and intelligently watched, and it may be ten or twelve years before the time will be ripe for passing final judgment.

A new Fleet, propelled at least in part by oil, will be defending the flag, our commerce, our food-supplies, and the Empire by that date, and the ships will be manned by officers and men trained under quite novel conditions. They will be no longer sailors, but mechanicians, from the admiral on the bridge directing the men-of-war under his command as they move in and out in seemingly dangerous tactical exercises, down to the youngest boy on the lower deck. It is hoped that the new may be grafted on to what was best in the old; that the splendid devotion of the service, its clanship, its lofty traditions, its adaptability to deal with any situation, naval, military, or diplomatic, may be preserved; and that officers and men may be not less the 'handy men' they have shown themselves to be in national emergencies in the past. We need successors to Vice-Admiral Sir Gerard Noel, the diplomatist who settled the Cretan trouble when the Chancelleries of Europe were despairing; we need officers to fall into the places of such leaders and inspirers of men as Vice-Admiral Lord Charles Beresford, who organised with such marvellous rapidity and success a police-force at Alexandria in 1882; such sailor-generals as Admirals Sir Harry Rawson, Sir E. R. Fremantle, and Sir Edward Seymour, who led with such conspicuous success the Benin, Vitu, and Pekin expeditions; such administrators as Admiral Sir John Fisher, the initiator of the reform movement in the Navy; and such fleet-commanders, with a single eye to the efficiency of the squadrons in their charge, as Admiral Sir Arthur Wilson, Rear-Admiral Sir Wilmot Fawkes, and others. The nation may well view the death-blow to a system which has produced such a long line of splendid officers and resourceful seamen with regret and some misgiving. The fiat has gone forth. The old order is even now passing away and giving place to the new. Everything is undergoing change, and even 'the man behind the gun' is ceasing to be the hero that he was a year or two ago, and in his place we must pay homage to the gunnery lieutenant 'above the gun,' who in future naval actions will be mounted on a station up the mast, with a range-finder by his side, and from this lofty position will 'control' by means of the telephone the whole artillery fire of the ship.

The personal is always the most interesting; and before referring to the changes which are being carried out in the organisation of the squadrons, the alterations in the systems of entry and training of officers and men may be briefly indicated. The Fleet is being rendered more aristocratic and at the same time more democratic. The two movements are proceeding side by side. While it was never so difficult for a lad of poor parentage to enter the commissioned ranks of the Navy direct, however unimpeachable his antecedents, the opportunities of rising from the lower to the quarter deck were never so numerous. The born organiser has nothing to do with appearances, and those who have initiated these twin movements have not stopped to inquire what the man in the street will think of the changes.

[*All Rights Reserved.*]

They have considered only what they believe to be the best interests of the Navy. Apart from what may be regarded as domestic officers (doctors, chaplains, paymasters, and schoolmasters or instructors), the Navy has three lines of officers: the executive, the Marines, and the engineer. Under the old organisation each of these lines had a distinct entry, a distinct training, and consequently, though the officers spent their lives on the same ships in daily intercourse, they never became entirely one in sentiment—there was always a difference. The Marine officers received a purely military training, and were entered under conditions similar to those of the Army, and when not afloat were under the War Office. The conditions under which engineers joined the service were various. A certain proportion—the larger—went by open competition from middle-class schools to the Engineering College at Devonport, and thence qualified for their commissions; but a certain number were the sons of parents in humble positions who showed promise as shipwright apprentices in the dockyards, and by their own efforts, with the aid of the special dockyard schools—admirable institutions which have laid the foundations of the careers of practically all the distinguished ship-designers not only of the British Navy but of the mercantile marine — obtained entrance into the Engineering College. Others again joined as supplementary officers from workshops ashore or from merchant-ships in order to supply the needs of a growing Fleet. At this period, when the need for officers exceeded the supply, a number of young officers of the mercantile marine were also entered as executive officers. The result of these various methods of entry was not entirely satisfactory, and the engineers in particular complained of a number of grievances.

The Admiralty faced the situation, not by granting the concessions asked for, but by sweeping away the various regulations which had enabled practically any one of good character and ability to become a naval engineer, and made this line, like that of the fighting or executive officer, one to be entered only on the nomination of the First Lord of the Admiralty. In future all young officers—future admirals, generals of the Marine corps and engineers—will enter under the same conditions, and for the first seven years undergo a similar training, which will be largely mechanical. From the age of twelve or thirteen years until they attain the age of nineteen or twenty, the future officers will receive identical instruction and opportunities.

In no other service in the world can a parallel be found to the system which has now been introduced into the Navy. The Admiralty have decided that at the age of twelve or thirteen, when boys must enter the service, it is unfair to make them sit to a competitive examination, so they are requested merely to appear before a committee of admirals and others. The proceedings are quite informal, and are aimed to ascertain the mental quickness of the lads. The budding Nelsons are put at their ease, and are encouraged to talk by questions intended to test their smartness and powers of observation. They are asked about their hobbies, their studies at school, their sports, and their desire to enter the Navy. As a rule the lads lose all nervousness, and talk as freely as in their homes. Some of the questions have been of the quaintest character. One boy, on coming out of the room at the Admiralty, was asked by his tutor how he had got on, and he appeared a little depressed. 'You see, sir, one of the gentlemen asked me what colour my father's hair was.' 'Well,' responded the tutor, 'that was not a difficult question to answer.' 'Well, sir, father has none; but I could not tell the gentleman so.' Other boys have been required to tell how they had reached the Admiralty, what was paid to the cabman, and so on. This scheme has proved most successful. The lads who are recommended to the First Lord of the Admiralty by this committee have to satisfy a medical man as to their physical fitness, and then they must submit to a simple qualifying examination, which is not competitive. These preliminaries passed, the cadets enter the new naval college at Osborne for two years, and then spend another two years at the college for older cadets at Dartmouth. The curriculum is so balanced that a large proportion of the cadets' time is devoted to the study of practical engineering in the workshops and the flotilla of steamboats which are maintained for their benefit. For the rest, they are instructed in mathematics, with geometrical drawing, physics, and mechanics, with laboratory work, seamanship, navigation, French and German, English grammar, composition and literature, geography, and Bible study, and they are drilled frequently and encouraged to take full advantage of the gymnasium. In conjunction with this course, the cadets go to sea in a cruiser in order that they may become familiar with the actual conditions of the life for which they are being prepared; but even at sea their studies continue as usual. At the end of the second and fourth years of training the cadets are examined, and only those who give satisfaction are allowed to continue the course. Having passed out of the training establishments, the young officers are then sent to sea in ordinary men-of-war, and remain afloat for a period of three years.

At the end of this period the noviciate ends. By this time they will be embryo engineers, besides having acquired a good general and naval education. Then their careers diverge. They continue their training according to the line they are to follow, either as executive officers, engineers, or Royal Marines. By this means, by having one source of supply, one system of entry, and one mode of training, it is hoped to produce officers with a community of training and lifelong community of interest. Every officer of the Fleet of the future will be something of an engineer, from the admiral in command of a squadron to the lieutenant in charge of guns or torpedoes. The Marine officers, though they will keep watch at sea and carry out general executive duties, will retain their military titles, while the

executives and engineers will have the usual sea-ranks: lieutenant, commander, captain, rear-admiral. The engineering line will be differentiated merely by the letter (E) after the title, as is the case at present with specialists among executive officers, who have the initial letters of their line—(N) navigation, (G) gunnery, or (T) torpedoes—added after their names. If by mischance a future Nelson should get sorted when nineteen or twenty into the engineering line, the door is open by which the Lords of the Admiralty can remove him from beneath the armoured deck to the quarterdeck for executive duties. Between the three lines of officers there will be similar opportunities of promotion, and the pay will be much the same; but at present no engineer officer will be permitted to rise higher than the rank of rear-admiral (E).

It has been said that the new scheme, so far as it affects the officers of the Navy, is anti-democratic. This will be understood when it is stated that the parents of the cadet must on his entry find an outfit costing from thirty-five to forty pounds, and pay the Admiralty seventy-five pounds per annum during the period of training. In addition, pocket-money, travelling and personal expenses, and upkeep of kit will absorb not much less than forty pounds. In the United States cadets have everything found by the State, and in addition receive quite considerable pay. However suitable the boy, it does not necessarily follow that his parents can afford the outlay in starting him in life in the British Navy; but each year hundreds of lads are in this enviable position, and the Admiralty take the best of them.

Concurrently with this new scheme for the officering of the Navy in future, the Admiralty have reformed the system under which seamen are trained. It has been the custom to train them in sailing-ships; they have had to master all the mysteries of yards and arms, though for years past they have had nothing to do with such things when at sea, and they have been stored with an immense amount of lore which was most useful, and indeed essential, in Nelson's day, but is now completely out of date. The Navy has changed, and it was inevitable that the method of training the crews should also change. In the realisation of this need, the British authorities have been the pioneers among the Admiralties of the world. There is no alteration in the method of entry or in the care exercised so as to obtain only boys of good character and the best physique. Whatever may be the fact as regards the Army, the Navy has so many more applicants than it wants that the recruiting officers are able to pick and choose, and those who finally enter are the best mentally, morally, and physically. While still of comparatively tender age they are put into the naval mould, and in five or six years a disciplined, intelligent, and well-educated British blue-jacket is turned out. This period of training is not now more or less wasted in an attempt to turn out old-fashioned sailors prepared to shiver their timbers on the slightest provocation; the probationary course is aimed to produce the men which a mechanical Navy requires—the sailor-mechanics, with more of the mechanic and less of the sailor in the compromise between the old régime and the new. Training in masts and yards has been abolished, and will never appear again. In its place, in order to train the hands, eyes, and nerves of the blue-jackets, they are put through a course of physical drill and their characters are formed in the rough-and-tumble life of the training establishments. For the rest, the boys on board the training-ships are taught the use of simple tools, stoke-hole duties so that they may be able to take a shovel if necessary, and a great deal of elementary information with reference to mechanics. At the same time they continue to be taught all the essential lore of the sea and the use of the rifle, are initiated into the mysteries of gunnery, and go to sea for instructional cruises. In fact, in place of the knowledge which their predecessors had to acquire, the blue-jacket of the new school has to imbibe an immense mass of information having a direct bearing on the mechanical fighting-ship in which he must spend his days, and if need be fight; he is something of a scientist, and it is hoped will retain the splendid qualities of daring and resourcefulness which distinguished the seamen of the old Navy.

At the same time the horizon of the lower deck has changed, and every boy who joins the Navy can carve for himself a career. The list of warrant-officers has been increased, and promotion to the rank of lieutenant is now thrown open to young and promising men, who quickly pass through the lower ratings and reach the rank of commissioned warrant-officer at a sufficiently early age to render promotion practicable and desirable both for himself and the Navy. There are now over fifty lieutenants in the Navy who have come in 'through the hawse-hole,' as the saying is; and, in addition, there are artificer-engineers and carpenter-lieutenants, both classes holding the King's commission. Though a boy cannot rise to be an admiral yet—that may come in the dim future in exceptional cases—he may nurse the ambition of rising to a rank which is equivalent to a captain in the Army, carrying good pay and pension. One of these officers, who, by hard work and attention to duty, has risen to be a lieutenant, recently reduced the late concessions of the Admiralty to a financial statement. It is impossible to calculate the gain of commissioned rank in pounds, shillings, and pence; but in pay and allowances the concessions made to the warrant-officers of the Fleet have meant an addition of one thousand one hundred and fifty pounds to the total pay a lieutenant from the lower deck receives as an officer before he retires, and in the meantime he has the enjoyment of a rank, uniform, and authority which are above price as rewards for good service. In consequence of these changes, the lower deck is attracting in increasing numbers boys of good parentage and education. The concessions of pay and promotion have been accompanied by reforms in the victualling and in the meal-hours, and

by many other changes which have made life afloat far more comfortable. It is confidently hoped that the old spirit of devotion, daring, and obedience to orders may be encouraged and not weakened by the greater consideration shown to all classes on the lower deck, in the engine-rooms, and in the stoke-holes.

While this revolution in the personnel of the Fleet has been proceeding, most important reforms have been made in the composition and organisation of the fleets. Just as the training of officers had undergone little change for many years, so the disposition of ships had remained very much what it was in past decades. Now the motto of the Admiralty is concentration. The seas are all one in these days of swift men-of-war, battleships with speeds ranging up to nineteen knots, and powerful armoured cruisers capable of travelling at twenty-four knots an hour. The steam-engine has enabled these gun-platforms to be moved from one side of the world to the other in an astonishingly short time. Consequently the British Admiralty have been gradually drawing their ships nearer the strategetic centre of the Empire, so that they may be flung out in any direction desired as soon as the character of the warlike operations is known. A large number of small ships in far-off seas, too weak to fight any probable foe and too slow to run away, have been paid off into reserve or sold out of the service, and the officers and men forming the crews have been turned over to veritable fighting-ships. Thus, distant squadrons have been reduced, and three—stationed on the south-east coast of America, the North Pacific, and the South Atlantic—abolished; additional ships have been allotted to the main fighting forces—those in the Mediterranean, China, and home waters; and, by agreement with the Australians, a bigger squadron is now stationed in Australian waters. Two new squadrons have been created in home waters. In addition to the Atlantic Fleet—which has Gibraltar as its base, ready to reinforce the Mediterranean Fleet, steam into the English Channel or North Sea, or proceed into the Atlantic—we now have a new Channel Fleet, which has as its base Portland, where, if circumstances demand, the newly created First and Second Cruiser Squadrons, comprising twelve armoured cruisers, as distinct from cruisers protected only with a steel deck over the engines and vital portions, will also forgather.

The fighting value of the British Fleet has been trebled, partly by the construction of new ships, and partly by improvements in the war-training carried out and the better organisation of the forces at the command of the Admiralty. Never was the British Fleet at sea so immensely strong. Day and night it is always alert, always prepared for war. There is no need for hurried preparations when a crisis occurs, for each ship when she leaves the dock-yard, while as yet there is no thought of hostilities, carries with her all the stores, ammunition, and torpedoes she would require to go into action if war occurred a week later, while, maybe, anchored in the Tyne or crossing the Atlantic. At the same time, an immense improvement has been effected in the organisation of the ships in the reserves at the naval ports, so that in case of need little delay would occur in getting them to sea. The essential officers and men are on board the ships on the 'War List,' and the vessels lie ready coaled and stored, with the pennant flying, only needing certain unskilled hands to be ready in all respects for war. At each of the three home ports a rear-admiral is in command of these 'reserve ships in commission.'

The British Navy is divided up into eleven squadrons or fleets, of which the real battle-forces consist of the Mediterranean, Atlantic, and Channel Fleets, and the China and three Cruiser Squadrons, while in addition there are squadrons of less powerful ships for the protection of commerce and the showing of the flag in the East Indies, off the coast of Australia, in Canadian and West Indian waters, and off the Cape. These squadrons are on duty, winter and summer, on the particular portion of the ocean under their charge, and they are controlled by thirteen admirals.

The strength of these forces may be appreciated from the following brief summary:

Channel Fleet.—Twelve battleships, two protected cruisers, twenty-eight torpedo-boat destroyers, and a number of torpedo-boats, small cruisers, and gunboats that are attached to the command on occasion. The First Cruiser Squadron is attached to this force.

Atlantic Fleet.—Eight battleships and two protected cruisers. The Second Cruiser Squadron cruises with this fleet.

Mediterranean Fleet.—Eight battleships, several protected cruisers, three torpedo gunboats, twenty-seven torpedo-boat destroyers, and a number of torpedo-boats. Attached to this fleet is the Third Cruiser Squadron, comprising armoured and large protected cruisers.

China.—Five battleships, two armoured cruisers, seven protected cruisers, several sloops and gunboats, and ten torpedo-boat destroyers.

Australia.—One armoured cruiser and ten small cruisers and sloops, several of little fighting value.

Cape of Good Hope.—Five protected cruisers (one of the first class) and two sloops.

Particular Service Squadron.—Six protected cruisers, mostly used for training cadets and boys, but ready at short notice for war duty. This force cruises in the North Atlantic in summer and in West Indian waters in winter, thus enjoying model climatic conditions.

In the barest summary these forces make an imposing list, and give some indication of the value in actual defence for their liberties, territory, and trade which the British people are receiving for their money. Such a Fleet always in commission, and with reserves in the ports at home, cannot be provided save at great cost. The annual sum spent upon the Navy is the nation's insurance premium on its over-sea commerce, its huge mercantile marine, and indeed its food. While it is true that the burden of naval defence was never so heavy,

it is also true that never was the trade needing defence so large nor the jealousy with which it is regarded so apparent. At the same time, no one who has studied the present organisation of the British Navy and is acquainted with the work it does in rendering itself fit to stand the strain of war will doubt that every pound produces a better return in actual safety than ever before. The Navy is the nation's all in all. It is not a perfect organisation; but it is progressive and it is intelligent, and it is controlled by a department which has no superior in energy, forethought, and business capacity.

GIANT CIRCUMSTANCE.

CHAPTER VI.—BACK TO THE FRONT.

SIX-FOOT-THREE Brading's large soul was too large even for his tired body when Geoff walked in on him next morning. It was minutes before he could do more than wring the strong brown hand in his two knubbly, shaking ones, with glistening eyes and no words. His eyes were wonderfully bright and penetrating. His long gray beard fell over his breast. He had the look of an ancient seer.

'Just looked in to say how-d'ye-do and good-bye, Old Brading,' said Geoff cheerily. He had been Old Brading to Ellen and Geoff for twenty years past. 'I'm off at noon. I hope they'll keep a bit of the fighting against I get there. Any message to Tom, if I come across him? I've not seen him yet, but we're spread like a long snake—pretty thin snake, too, I can tell you—over five hundred miles of desert, you know.'

'Too long, too long,' said the old soldier, who knew by bitter experience what long thin lines of communication meant.

'Yes, it's a bit shaky in places and uncommonly hard work. But it can't be helped, you see.'

'Gives 'em chances, sir. If they're up to their business they'll cut you.'

'They've tried it a good many times in a small way, and got hurt. Now they're learning wisdom.'

'I'm going too, sir, thank God, and the General, and Miss Ellen! Tell him, sir, if you come across him—Tom, I mean—tell him I'll be looking out for him on last parade, and he's to meet me sure. I'm thinking likely it won't be long.'

'There'll be some warm work if we can corner them. They fight to die, Brading, and they don't know what fear is.'

'That makes good fighters, sir, and heavy lists. But a man dies when he's got to. You'll come through it, sir,' he said, gazing up at Geoff with those strange, bright eyes. 'You've come through worse, and you'll come through this. But I'm doubting if my boy will. We'll meet all the sooner, maybe. Good-bye, sir, and God bless you!'

And then Geoff wrung the horny hands again, and said 'Good-bye,' and went on to make another call, which, in his own mind, he had decided must be made, though it could not but be a painful one.

He went to see the Grand Duke of Saxe-Hohenburg-Eisenach.

All the blinds were down still in the great gloomy house in Park Lane. The final sorrow—the sorrow for which time held no alleviation—had fallen there. The blinds would be raised again in time, but the sorrow never.

A solemn footman in black ushered him into a library at the back, and carried away his card, and in a very few minutes His Highness came quietly in, a tall, soldierly man, with white hair and sternly, set face lined with many cares.

He came straight to Challis and took his hand.

'Mr Challis,' he said, with the slow emphasis of one who still thought in German while speaking English, 'I have never doubted you since I learned the full facts. But had I done so this would have dissipated my doubts. You come at your own instance?'

'Absolutely, sir. No one even knows of my coming. But'——

'So! I should have known it. Pardon the inadvertence. I need not wear any disguise. It has been a crushing blow. He was our final stay. Life holds nothing more for us but the hope of a speedy reunion. Life is a tragedy. The curtain falls too slowly when one's heart is already behind it.'

He was holding Geoff's hand as he spoke, and Challis's tightened lips barely kept his face in order. The profound grief of this prince of many sorrows touched him to the quick. He bent over the old white hand to hide the working of his face. Then he looked up quickly.

'If my own life would have saved his I would have given it many times over, if that had been possible.'

'I am sure of it. But it was not to be. And you—you have suffered much also. Is it not so?'

'I have envied him his gallant death, sir. I am leaving for the front again to-day. I do not think I am likely to return. I do not know that I wish to.'

'*Ach!* But you are young! Life is before you.'

'Pardon my speaking of myself at all, sir. I had no intention. The certainty that you bear no hard thoughts of me will be a very great comfort to me. I thank you with all my heart;' and he made as though to go.

But the old man took his hand and held it.

'Shall I be asking too much if I beg a few minutes more?' he said with quiet urgency. 'His mother, I know, would like to hear of her boy from the lips of his friend. May I?' and he drew him towards the door.

Challis followed him up the wide, noiseless staircase and along a soundless passage. The great house felt like a mausoleum. The shadow of death lay heavy on it. The Grand Duke tapped softly on a door and signed to Challis to follow him.

'Everhilde,' he said very gently, 'Lieutenant Challis has come of his own heart-goodness to see us. He was with our dear boy at the last. I knew you would like to speak with him.'

Such a sweet, white face, such a frail, worn body, lapsed in the big chair before the fire; such ineffable bereavement in the sad blue eyes, still heavy with weeping!

Geoffrey bent over the little marble-cold hand, and in spite of himself dropped on one knee and kissed it gently. The other hand hid her face for a moment, and then she said in a very soft voice, but with much more of an accent than the Grand Duke had, 'We have thought much of you, Mr Challis, and spoken much. I think we have done you no injustice. If we do not encroach too much upon your time, will you tell us all you can of him?'

And he sat with them for close on an hour telling them all he could remember of their boy's doings in camp and on that fatal day of the hunting-party. He told them of the high esteem and liking they had all had for him, of his gay spirits and camaraderie, and in minutest detail the last happenings of all.

The father nodded understandingly at times, and at times the mother's tears fell silently. But when all was told, and Geoffrey rose to go, because his time was getting short, there was the warmth of genuine kindliness in their farewells.

'Do not throw yourself away, Mr Challis. True men are always wanted,' was the grim old soldier's last word. 'We give you God-speed and safe return!' and Geoffrey was out in the street, in the life-giving air and brisk turmoil, stronger of heart and comforted somewhat by this wholesome contact with troubles infinitely greater than his own.

He never forgot his visit to the house of sorrows; and the remembrance of the lofty resignation with which those two, born to the highest estate, and ground small in God's mills, bore the utter desolation of their old age, braced him to a quiet face and calm bearing in the times that followed.

With similar 'God-speeds!' and 'Safe returns!' from Ellen, and the General, and Doone, and Colonel Trevor, his train ran out from Charing Cross at noon, and he was speeding back to the front, having been in England exactly seventy-two hours.

As he had promised them, he made record time. On the twelfth day he rode into advance headquarters' camp on the fastest dromedary money had been able to procure, and tumbled off, stiff but cheerful.

He reported at once for duty, and Colonel Everett's greeting was amusingly nonchalant and truly British.

'Hello, Challis!' he said, with a sudden smudge of brick-red in his sun-cracked face. 'Come back? Had a nice journey?'

'I've come as quickly as I could, sir, and I'm a bit stiff, otherwise fit.'

'Anything going on at home? You didn't waste much time there.'

'I had three whole days.'

'Gad! I wish I could get three days there—without missing anything here.'

'What are our prospects, sir?'

'They're reported making a stand about three days ahead. If they'd only root there till we come up we'd bless them.'

The news of Challis's arrival had spread, and Cameron and some of his fellows were waiting to get hold of him, and gave him a hearty welcome.

In the shelter of Cameron's tent they plied him with questions and aired their own opinions freely.

'Now, see here, boys,' said Challis, 'to-morrow night I'll talk to you all night if you like. To-night I'm going to sleep. I've had twelve days and nights on end, and I'm tired. Here, Evan, catch hold of that end'—of a mighty silk bandage which swathed him from chest to loins to stiffen him against the jolting of his fast camel—'there's about fifty yards of it, and I'm not sure that my ribs won't come away with the last folds.'

However, they got him stripped by degrees, and then he sat in a tub to soak and swill. And then he ate and drank, and fell on to Cameron's bed and slept for eighteen hours, and turned out at réveille next morning clean and trim, and bodily not an ounce the worse for his slow run home and his quick run out again. But his face was still a trifle leaner and harder than it had been, and they put it all down to the stress of what he had gone through.

He fell at once into the old routine, with labours increased in proportion to the increased distance from the base, but with the added exhilaration of prospective grips with the elusive enemy within a few days, and grateful above all things that he had arrived before it was too late.

Among his special friends among the subs—most of them, but not all—he found no lack of friendliness; on the contrary, a subdued sympathy which displayed itself rather in tone than words. But among the higher officials he was conscious of a certain coldness and aloofness which had not been there before, and which stung him somewhat. But, after all, it was only what the General and others had foretold, and he braced himself to sufferance without sign even of perception.

'A good hot fight would clear the air,' he said to himself more than once, and there was little doubt of that. If they could only close with the *jibbahs* the fight would be hot enough to satisfy the most exacting, and the chances were that the clearances would not be confined to the air.

So he went about his duty with an unmoved face; so unmoved, indeed, that the humorous creases never showed in those days, and there was a tight-set grimness about it which gave it a look of hardness, of harshness almost.

The trouble had told on him, and Una Devon's

defection more than all the rest. The other had been hard to bear, but an absolute unconsciousness of default had carried him through. Una's falling away, however, left a ragged wound in his life, which, he said to himself, would never heal.

He and Cameron drew very close to one another in those days, and Evan's warm friendship was balm to his wounded soul. It was not a matter of speech between them. They were very much alike in that respect. Of their deeper feelings they rarely spoke; but speech is the shallowest and crudest vehicle of expression, and they understood one another perfectly.

The others, even those who had heartily welcomed his return among them, drew off somewhat by degrees. Perhaps the blame was not wholly theirs. His pride was in arms, and he covered his wound with a silent reserve which permitted no sympathy and did not make for active good-fellowship.

Then, too, the others could not but perceive the strain of the relations between himself and the higher powers, and the trend of popular feeling runs inevitably in the direction of the powers that be, when individual well-being depends entirely upon them.

Challis perceived it all, though he gave no sign. After all, it was only what he had expected, and he longed the more for the strain and stress and wild emancipation of a fight.

He was picking his way through the maze of tiny shelter-tents to his own quarters one night, after a round of outpost duty, when he heard his own name under discussion, and could not but overhear something of what passed. He had been somewhat curious to know how the men regarded the matter. These men and he might any hour now be in the thick of it, dependent on one another for life and honour. He would be glad to know how far they believed they could rely upon him, and how far he could rely upon them, as between man and man. And the chance was given him to learn.

'Well, I d'n' know,' growled one. 'I'd 'a followed Left'nant Challis to the end. But I'm shook a bit with all this kick-up. You say 'e's all right, Tommy, an' I don't say 'e ain't. But if 'e is all right, what I say is: why 'd they send 'im 'ome to be shot, as they did—see?'

'Why 'd they send 'im back alive an' kickin' an' all as-you-were an' hunkadory, if th' was anythink wrong, you gumph?'

'Well, as to that, my son, you don't know everythink, not by any manner o' means. They do say, for instance, that if 'e 'adn't 'a been agoin' to marry old Red Tape's daughter things might 'a bin a bit different.'

'Rot an' tommy! Now, I puts it to you straight, old man: what would you 'a done yourself in Challis's place out there that day? What would you 'a done different from what 'e done?'

'Well, maybe I'd 'a stopped there.'

'An' what good would that 'a done, 'cept stop your growlin', for which the Lord would 'a made us truly thankful? Come, you tell me that! What good would it 'a done? Would your stoppin' 'ave saved them others? Not a bit of it, an' you knows it, an' the big bugs knows it. It was a disaster, an' there was no one to blame'——

'Then why 'd the court-martial send 'im 'ome to be shot? You tell me that, seein's 'ow you know everythink.'

'Oh, blame 'em! I don't suppose they knows themselves. Thought there 'd be a bit of a row, I suppose, an' sooner 'e got brimstone than them. That's 'ow I figure it up. I tell you, it's not many men would 'a come back at all. Old Red Tape could 'ave got 'im exchange as easy as winkin', you bet. Fact that 'e 'as come back, an' come back smilin', as you might say, though 'e don't smile as much as 'e used to, that proves that 'e's a man. You keep your eye on 'im when the fightin' comes, an' you'll see—unless you're a-sneakin' off to the rear to look for an ambulance for some one that don't want it.'

This remark was apparently followed by rebuttal of an active nature, and Challis went on to his own tent.

OUR MILK-SUPPLY.

By Mrs SANDERS.

A NEW form of powdered milk has lately been put on the market; and as it has received the silver medal of the Royal Agricultural Society, it may be taken as an indication that the claims made for it are well founded.

It is now fairly well understood that the conditions of our milk-supply are not satisfactory. There is no fluid so easily contaminated, and medical men of all ranks have come to the conclusion that the milk-supply of the people is more often than not a probable vehicle of infectious disease, and that the first care of all who have the preservation of public life and health at heart must be directed to the question of the purification of that supply.

But to learn whether that desirable end is to be found in the various forms of powdered milk—even those that have received the *imprimatur* of distinguished societies—we may turn to the opinions of various experts, opinions anything but favourable to such methods as have come under their notice.

The medical officer of health of one of our large towns condemns most emphatically the patent foods and condensed milk so widely advertised and puffed

up. 'Even indolent mothers,' he says, 'would hesitate to use them if they understood how unsuited they were to the digestive powers of a young infant, and that the pleasing plumpness they produce is a hollow mockery, leading to rickets and other infantile diseases, and undermining the child's power of resistance to infectious complaints.'

It may be that the above expert has not come across the 'Just-Hatmaker' process, as it is claimed for it that it absolutely destroys the myriads of bacteria that find their way into the best-kept dairies; and that it is not only more effectual than sterilising, but that whatever changes take place in the casein tend in the direction of making it more digestible. Messrs James Milne & Son, Milton House, Edinburgh, are the makers for this country of the Just-Hatmaker milk-drying machine, which has already been introduced in many dairies in England, America, Belgium, France, Italy, Switzerland, Germany, Russia, New Zealand, and the Argentine Republic. The process is carried out in a machine of the simplest construction. Two polished metal cylinders, twenty-eight inches in diameter and five feet long, are mounted parallel in a solid framework, and separated from each other about an eighth of an inch. They are revolved inversely, making six turns per minute. Above them is placed a small box for holding the milk. Steam at a pressure of three atmospheres is introduced within the cylinders, the surfaces of which are thereby heated to a temperature of between two hundred and twenty degrees and two hundred and thirty degrees Fahrenheit. The liquid milk to be dried is allowed to fall in thin streams upon the heated revolving cylinders, and its water is rapidly evaporated. Each cylinder becomes covered with a thin layer of dry milk, which is removed by a knife as the cylinders revolve. The dry milk comes off in continuous sheets, and falls into the box made to receive it. It is passed through a sieve to reduce it to a uniform powder, which somewhat resembles flour. Galak is one of the names under which this is sold. The milk-powder offered to the public can be remade into milk by the sole addition of the water (boiled) that has been extracted from it.

The most remarkable thing about this process is its simplicity, the fact that milk is sterilised, and the gratifying results which have followed its use as a children's food. After being exposed to a temperature of two hundred and twenty degrees the milk is absolutely sterile. The casein in the milk, reconstituted from the dry milk, forms in the stomach in small granular particles like human milk, and not in large clots like ordinary cows' milk. This division of the casein into fine particles is said to aid digestion.

Thousands of tablets have been ordered by the German Emperor, and large quantities have also been sent for the use of the troops in Manchuria. We may add that Mr J. R. Hatmaker, who has originated many inventions, has set them all aside in the meantime to push this one. For some years he was secretary to Cornelius Vanderbilt, and now resides at 28 Boulevard Malesherbes, Paris.

Sir James Crichton Browne, an authority whose words no one will be disposed to dispute, lays great emphasis on the value of milk at all stages of life, while at the same time he admits its liability to contamination and adulteration. He says: 'A supply of good milk is of much consequence in many cases of sickness; especially in typhoid fever life itself depends on it; and at all times a freer use of milk would contribute to strength and vigour, providing, of course, the milk is good. I could point to many of my friends,' he adds, 'who would be better in health and pocket and temper if they would substitute a quart of milk for the bottles of champagne, at twelve and fifteen shillings, they absorb daily.'

Dr Andrew Wilson, another great authority on hygiene, points out that milk should not only be absolutely free from disease-germs and other impurities, but also that it should be of such quality as is required for the building up of the physical frame. Even where every attention is given to keeping the milk in the pure state in which it comes from the cow, an unbelievable quantity of deleterious matter is to be found in it, as every one knows who has had an opportunity of examining the residuum left in the separator after use. Dr Wilson describes a new method of treatment as practised by the Aerated Cream and Dairy Company at Battersea, which not only ensures these desirable results, but in addition enhances the keeping qualities of the milk and preserves it in the same state at the completion of the process as at the beginning, while many of the condensed and evaporated products show an excess of sugar or fat, or other objectionable matters. 'The milk, having been passed through a fine sieve and then a finer, is heated to one hundred and fifty degrees Fahrenheit and passed through an ingenious mechanical contrivance which breaks up the fat globules into minute particles, and fixes the same in the milk so that there shall be no after separation of milk and cream.' It may be pointed out in passing that this is a great point gained, as when the cream rises to the top there is a danger of its being abstracted, the sufferers generally being the young children, who are supposed to be living on whole milk when in reality the most nourishing part of it has gone astray either by the intervention of some marauding cat, or more probably of those who are always ready to make a scapegoat of pussy. The further sterilising of the milk consists in passing it over coolers, which reduce the temperature to forty degrees Fahrenheit, and then it is aerated and forced into a receiver, which fills the bottles with the aerated milk and seals it hermetically. The bottles are placed in a tank full of water, and the milk again heated to one hundred and fifty degrees Fahrenheit, at which point it is kept for some time, after which it is understood to keep indefinitely, so long as it is protected from the air; and even after

being uncorked its keeping qualities have been found to be quite equal to those of ordinary milk under similarly favourable conditions. The system is undoubtedly elaborate, and could only be successfully carried out on a large scale; but what a revolution in the milk-trade may be created when the familiar cry of 'Milk-ho' is no longer heard in our streets, and, instead, paterfamilias orders in his case of milk as he does his wine, and the nervous mother can take down her bottled milk to her seaside lodgings without fear or foreboding as to possible infection!

MAJOR MELLORDYCE'S WIFE.

PART II.

'HERE get out here,' said Ackworth, opening the door; and while he was paying the cabman Mellordyce stood on the pavement and looked about him. They were in a street somewhat wider than the others, that seemed to be a main thoroughfare leading towards the docks. Numbers of oddly dressed men—seafaring and others—jostled each other with a rough exchange of banter on the pavements; women with baskets passed to and fro; ragged children played in the gutters; an organ-grinder farther on was surrounded by a troupe of hoydenish girls and youths dancing to his inspiriting strains; at intervals the garish flare of naphtha-torches marked the position of some street-vendor's booth. Much the same scene may be witnessed in London on any marketing night in the neighbourhood of New Cross, with the exclusion of the semi-nautical element.

Ackworth seemed quite at home in this forbidding quarter. In silence he led his friend down dingy side-streets and narrow alleys till, after five minutes' sharp walking, they paused in front of a leather-seller's shop, at the side of which a small private door fronted the street. Ackworth knocked three times on the panel of this door—three slow, single knocks—and almost immediately it was cautiously opened from within.

Ackworth whispered a word, and the door was opened a little wider—just wide enough to admit them. No sooner, however, had they crossed the threshold than it was quickly closed again and locked.

Mellordyce found himself in a narrow, dark passage, at the farther end of which a glimmer of light crept from beneath the chinks of a door.

'Follow me,' said Ackworth.

The man who had admitted them had already disappeared into some hidden apartment or alcove. At the end of the passage Ackworth stopped. Behind the door they could hear voices speaking. Ackworth turned sharply to his left, and now that his eyes were becoming accustomed to the darkness, Mellordyce could distinguish a small wooden staircase just beyond them.

'Our lives depend upon silence,' Ackworth whispered. 'Step softly. Don't stumble. There's a room at the head of these stairs into which we are going.'

Mellordyce nodded. Ackworth ascended the stairs with the Major at his heels, and opened the door of a small chamber. As soon as they had entered it he closed the door softly and struck a match.

'The window looks out upon a deserted yard,' he explained. 'The room, you see, is empty; also, not overclean. Now listen.'

Again Mellordyce heard the sound of voices talking, this time more plainly, and directly underneath them. The match had gone out. Ackworth stooped, and, groping on the floor, presently removed with great care a small piece of boarding.

'Look!' he whispered, rising to his feet.

Mellordyce knelt down. A small shaft of light shot up from the room below; there was a tiny hole in the rafters, scarcely more than a square inch in width, but through it Mellordyce could catch a restricted glimpse of the apartment beneath; and, by a singular chance, in this limited section of vision was framed the profile of one of the occupants of the room.

Mellordyce uttered a stifled exclamation; but in an instant Ackworth had gripped his arm.

'Not a sound!' he whispered.

'My wife!' groaned Mellordyce.

'Yes. Do not stir; do not speak.'

Mellordyce put his eye once more to the tiny square of light. The face of his wife no longer came within the radius of this minute visual arc, but only now and again the portion of some human figure restlessly moving. Now, however, the voices of the speakers were distinctly audible, and Mellordyce could hear without effort each word that was uttered by them. Ackworth was bending beside him. In this attitude the tones of a man, one who, from a certain authoritativeness in his delivery, appeared to be the leader or president of the party assembled, struck upon their ear. He spoke in French, and at his first sentence Mellordyce felt a dull pang smite upon his heart.

'We have read the minutes,' said this voice, 'and now, Vera Laramoff, it is you whom, in the name of the committee, I have to address. You are aware that the man Edward Mellordyce, your husband, is under sentence of death. You are also aware that, as the daughter, and therefore the rightful avenger, of the patriot Laramoff, you took the oath of the society, and by virtue of it were elected as the instrument proper for the carrying out of this particular sentence.'

'Yes, I know,' came the clear voice of a woman in response; and again involuntarily Mellordyce started, for it was the voice of his wife.

'We have given you six months,' went on the speaker. 'It was advisable, for reasons we know, that the sentence against Mellordyce should be carried out in England. There is no need of further delay, however, and it is the order of the committee, to be communicated to you through me, that you fulfil your duty, in obedience to your oath, within the next three days.'

A murmur of approval, a confused hum of voices, followed these words.

'Vera Laramoff,' continued the speaker, 'do you understand?'

'I understand,' said Mrs Mellordyce in a low tone.

'It is well. Within three days. We will proceed now to the other matters.' There came a pause and then again a hum of several voices speaking together.

Mellordyce had got on to his feet. 'Come,' he muttered hoarsely; 'I have heard enough. Let us go from this cursed den.'

Ackworth noiselessly replaced the small square boarding in the floor.

'We must let ourselves out quickly and quietly while they are still talking,' he said. 'I will go first. Follow close.'

Once more they reached the stairs, and descended them. The door at the end of the passage was still closed; the passage seemed dark; but as Ackworth turned into it and had already half-traversed its length, a light flashed suddenly out from an alcove, and a man holding a small lamp stepped forward to intercept them.

'Where have you come from, messieurs?' he demanded in bad French. 'Not out of the council chamber, for I should have seen you. Who are you, then, and what are you doing here?'

Ackworth calmly drew his revolver.

'One word—only one word more, my friend,' he said, holding the muzzle of the pistol within an inch of the man's face, 'and your wife is a widow!'

The man recoiled with an instinctive exclamation. Before he could utter another syllable, Ackworth's left arm shot out and the foreigner fell like a log at their feet.

'On the point of the jaw,' he explained to Mellordyce in an undertone. 'An excellent way to silence an obstinate obstructionist, and less noisy than a pistol-shot. Now, quick!' He stepped forward as he spoke, unbolted the side-door, and pushing Mellordyce through it, swiftly stepped after him. In three minutes, by plunging into the labyrinth of smaller streets, they had made themselves secure from pursuit.

'I told that cabman to wait,' said Ackworth, 'at the corner of the street where we left him. And there he is.'

The cabman, in obedience to his instructions, had for the past half-hour been walking his vehicle up and down the street at which his fares had alighted, and was pleased enough to see them at length approach him. The man was conscious of an uneasy isolation in this unregenerate quarter of London, where cabs are not greatly in request. He seemed to breathe a freer air when Billingsgate was safely left behind and the more familiar aspect of Cannon Street denoted a homelier locality.

Within the cab Ackworth and Mellordyce sat silent, each wrapped in his own meditation: Ackworth smoking a cigar, Mellordyce staring dully in front of him, for here was a situation created upon which words could fall only with a futile aggravation.

Ackworth never tendered advice unless it was asked for. Moreover, he knew that in such a juncture a man like Mellordyce was his own best adviser. Mellordyce only spoke once during the drive home.

'What was Colonel Laramoff's wife's maiden name?' he asked.

'Miss Lataler, an American,' replied Ackworth. 'She died several years ago—a beautiful woman.'

'Ah—Lataler!' said Mellordyce. 'I should have known that. Lataler—Lataille!' He laughed grimly. 'What a fool you must have thought me!' he added.

Ackworth shrugged his shoulders.

'Every man is a fool when he is in love.' He glanced at his companion. 'The folly of the gods,' he said. 'No, Mellordyce, I never thought you a fool; but I wish you could have proved me a liar.'

'You did the right thing,' said the Major slowly; and neither of them spoke again till the cab drew up at Mellordyce's door.

Ackworth got out too.

'I shall walk home,' he said. 'Good-night.'

Mellordyce took his hand, and for an instant the two men looked in each other's eyes.

'There is plenty of work to be done in the world yet, remember,' said Ackworth after a pause.

'Yes,' said Mellordyce. 'Good-bye.'

'Well, then, good-bye.'

He turned away and strode down the street. Mellordyce gazed after him a moment, then, with a sigh, mounted the steps and let himself into the house with his latch-key. The man-servant appeared to divest him of his overcoat.

'You can go to bed, James,' said his master. 'Tell the servants they need not wait up. I will let your mistress in.'

The house was quite silent when, half-an-hour later, the sound of carriage-wheels stopping outside caused Major Mellordyce to start from his reverie. The electric bell rang, and he walked slowly into the hall and opened the front-door. His wife, muffled in a light opera-cloak, stood on the threshold. A hansom was in the act of driving away.

'What, Ned!' remarked Mrs Mellordyce, with a little laugh, 'is it you? Where are the servants? I hope I am not very late?'

'No, Vera—not very late. I have just sent the servants to bed. Come in here; I want to speak to

you;' and he threw open the drawing-room door for his wife to pass through.

She entered the room, and, turning, stood with her head thrown back, confronting her husband in the bright electric light, her beautiful mouth curving into a smile, half-playful, half-wondering, and, as it seemed, full of gentle affection.

Mellordyce regarded her an instant silently. He had never seen her look more lovely, and he could not bring his mind to conceive that this dainty, girlish creature, so soft, so innocent, so lovable, might harbour against him thoughts of ill or treachery. She seemed so purely girlish, standing there in the light, with her sweet face framed in its hood of white, and her great dark eyes gazing at him so tender-womanly.

'You have had a pleasant evening,' he said at length, 'with your old friend, Madame Despard?'

'Pleasant enough,' she answered lightly. 'We talked.'

'I heard you,' said the Major quietly.

Vera Mellordyce started and a sudden strange expression passed over her face. She fixed her eyes on her husband with a startled look, and the colour rushed into her cheeks.

'You *heard* us?' she repeated slowly.

'Yes. I was there,' went on the Major, 'at the house of your friend, Madame Despard. She spoke with a strangely masculine voice.'

Mrs Mellordyce made a step forward, then swayed slightly and caught hold of the back of a chair.

'What do you mean?' she asked.

'I mean,' said Mellordyce, crossing his arms, 'that I know all, Vera. I know of your connection with the Anarchist society, of your meetings at a house in X—— Street, of your oath to avenge your father Colonel Laramoff, of your vow to kill me. This evening Ackworth and I went to that house. We secreted ourselves in a room over the one in which you and your—associates were assembled. We removed a piece of boarding. We saw and heard—enough.'

'Mr Ackworth!' gasped the girl.

'Yes. Ackworth is, as you say, a clever man. He knows everything. Within three days—those are your orders.'

Her fingers tightened on the back of the chair; her eyes were fastened with a terrified glance on her husband's face.

'No—do not speak. Hear me!' continued Mellordyce, as her lips parted. 'It is true I was the cause of your father's death. I acted, as I believed, in the fulfilment of my duty. I did not know you then. Nor till to-night did I know that you were the daughter of Colonel Laramoff. I thought you married me for—for other reasons than revenge. Vera, I have loved you very dearly. I would have trusted not only my life but my honour in your hands. It seems I have come near to losing the first. The last I have now no wish to keep. Ah, child, child! I have denied you nothing. I will not deny you what you now ask—my life is of no value to me without your love. I give it you freely. Take it!'

From his pocket Mellordyce drew the small revolver and placed it on the table.

'The pistol is loaded,' he said. 'You have only to point it at my heart and press the trigger.'

Mrs Mellordyce uttered a low cry. Mellordyce looked at her, and a curious smile passed over his face.

'I see,' he said. 'That would be murder, and you fear the consequences. Then'—he took up the pistol again—'I will save you from them, and yet you shall keep your oath.'

He turned the revolver towards his breast. His wife sprang towards him, and, catching the weapon, tore it wildly from his grasp.

'Ned! Ned!' she cried, 'for God's sake don't!'

He gave a short laugh.

'What!' he said in a chiding tone, 'is my little girl afraid?'

'I love you! I love you!' she moaned.

A sudden strange light leapt into the Major's eyes. He held her softly to him and looked down into her face.

'You do not *mean* that, Vera?' he said in a strained voice.

'I mean that I would die for you,' she murmured, her head falling on his breast.

'Vera!'

'It is true, Ned.'

Mellordyce drew a deep breath.

'Don't play with me,' he said sternly. 'My life is nothing; but your love is everything. Take the one if you like, but do not pretend to give the other.'

She looked up at him suddenly.

'How long did you stay at the meeting?' she asked.

'We left immediately you had received, and accepted, your instructions from the president,' said the Major.

A low, triumphant laugh escaped the girl.

'You should have stayed a little longer,' she said, nestling down into his arms. 'I have tried to protect you, dear, from them; now it is you who will have to protect *me*, if you think me worth it. When the meeting broke up, I lingered a moment to speak to the president. Well'—she produced from the folds of her dress another little revolver and held it laughingly up to the Major—'you see I am not *always* afraid. I spoke to him with this in my hand—for I know Monsieur le President—and I said, "Mr Mellordyce is my husband. You must absolve me from my oath, for I will not harm him." Ah! you should have seen the president start and glare at me. "You married him for that purpose, madame," he said; "you swore to kill him." "He was then my *future* husband," I retorted. "Afterwards I learnt—well, many things; and this, too—that to kill a man you love is not the part of a woman nor the duty of a wife; I abjure, therefore, my oath." He took one step, saw the revolver in my hand, and laughed. "Go, madame!" he said. "Your life

also is forfeit from this day. Go, then—and beware!" So I turned, and, still holding the revolver in my hand, walked out. All this you would have heard if you had stayed up there in that room—a little longer.'

Mellordyce's arms closed very tightly round his wife, so that her last words were almost whispered in his ear, and he could feel her heart beating against his own. Till that moment it seemed he had never known the meaning of perfect happiness, for the height of human happiness can be measured only by the depth of its misery, and both extremes his soul within the hour had tasted. Gently he released the girl from his arms, and, leading her to a chair, knelt down beside her and took her hand in his.

'God forgive me, little one,' he said, 'for doubting you! You were well named Vera—my true, true wife. To-night you have perilled your life to save mine. Yes, it is true we should have stayed in that room—a little longer.'

'And the Anarchists, Ned.' She looked down upon his upturned face with a grave smile. 'Will you protect me now—from them?'

Mellordyce gave a deep laugh.

'Ackworth and I, together,' he replied, 'are a match for all the Anarchists in Europe. There is only one thing in the world I fear—and that is not an Anarchist.'

'What is it?' she asked.

'It is that my wife may some day cease to love me.'

'Then you are the bravest man in the world, Ned,' she answered, smiling, 'for you fear—nothing.'

Mellordyce pressed her hand to his lips.

'I think,' she added reflectively, after a moment's pause, 'I rather like Mr Ackworth.'

THE END.

THE MOTORIST.

By Dr DAWSON TURNER.

THE title of Mr Filson Young's book, *The Complete Motorist* (Methuen), is ambitious; for, though motoring is one of the youngest of pastimes, the Motorists' Emancipation Act, or Act permitting their use and abuse of the highways, having been passed in November 1896, yet so great are the mysteries of the modern motor-car, and so many are the details to be mastered by those who would be conversant with the construction and management of the different types, that it would take a book some two or three times the size of Mr Filson Young's to justify the name of *The Complete Motorist*.

The progress of the self-propelled vehicle has been truly extraordinary. At the beginning of 1896 there were only three or four motor-cars in Great Britain, which had been imported by Mr Evelyn Ellis, Sir David Salomons, and Mr Thomas Elliott. These gentlemen were the pioneers of the new mode of progression; to Sir David Salomons in particular, who organised an exhibition of cars at Tunbridge Wells in October 1895, much credit is due.

It is only within the last two years that the sport of motoring has really caught on; but now its devotees may be numbered by thousands or tens of thousands, and the nation may be said to be divided into the two camps of the motorists and of the anti-motorists, for there is no half-way house or intermediate class. If you do not motor or drive in a friend's motor yourself, you are an anti-motorist. Not but that there are classes of anti-motorists: there are those who look upon motors as only one degree less evil than the devil's own carriage (they have been publicly dubbed by a reverend gentleman as such), and who would sweep them off the roads altogether; and there are those who would only further restrict their speed and reduce them to the level of the horse-drawn vehicles. Whichever class you belong to, you would find much to interest you in *The Complete Motorist*, for Mr Young writes both for the high-powered scorcher and for the low-powered, solid-tired anti-scorcher, who is content to use the roads in a reasonable way; and even the pedestrian will find crumbs of comfort here and there. Thus, 'There need be no disguise of the fact that motorists are not liked by the public at large; there is, indeed, no reason why they should be liked. We do not even like each other much; but we like ourselves immensely, and naturally we tend to become immensely selfish.'

One of the best chapters in the book is that 'On the Evolution of the Motor-Car.' Beginning with Heliodorus's reference to a self-moving chariot, we have recorded the sailing carriages of the Dutch (something similar was recently in vogue on the Southport sands), the steam carriages of the eighteenth and nineteenth centuries, the road-making epochs of Telford and Macadam, the stupid opposition and open hostility to Gurney's and Hancock's attempts to establish regular services of steam carriages, and lastly the adaptation by Daimler of the internal-combustion or petrol motor to purposes of road locomotion. It may be stated broadly that the modern motor-car is founded upon the work of Gottlieb Daimler and of Tzerny.

Mr Young gives an amusing description of the difficulties a novice has in choosing a motor-car: how he consults his friends, each of whom recommends a different car; and how at last he falls a victim to the dapper exponent of a dainty and glittering car, only one model of which has ever been made. The present writer's advice to such a person would be to make a beginning with a second-hand

car of good make, which he can knock about in gaining experience, and he will then reach a better position for choosing a new one.

Again, there is a plain and lucid description of the petrol motor and of its connections. Still, there are many who drive, or think they can drive, a motor-car to whom all this will be Greek, either because they have, like most women, a non-mechanical mind, or else they have a soul above such matters, and don't want or think it necessary to understand them. And that reminds me of a true story.

A gentleman staying at a country house wished to dispose of a fine motor-car. A passing visitor with more money than brains inquired its price. 'Eight hundred pounds.' 'All right. I will take it, and drive it home [some twenty-five miles away] this afternoon.' On being asked if he had ever driven a car before, he said, 'No; but there is no difficulty about it. You have only got to turn the handles.' He was now pressed to have, at any rate, a short preliminary drive with the chauffeur, and very unwillingly he gave way. Returned from the drive, he announced his immediate intention of setting out for home, adding that he understood the car perfectly. His friends, however, would not hear of his going alone, and he at length set off, reluctantly taking the chauffeur with him. Late that night the chauffeur returned; he was not to have returned until the next day. His story was that the gentleman insisted upon driving; that they had been twice in a ditch, and had other hairbreadth escapes; that the gentleman, after a time, sent him home, saying that he could manage the car by himself; and that he (the chauffeur) was only too glad to escape with sound limbs. A telegram came the next morning to say that the car had turned over, had caught fire, and was no more. This was, I should imagine, the most expensive motor-drive on record.

Objection might be taken to Mr Young's statement that the most popular form of ignition, and that which is being adopted on nearly all but the very smallest petrol cars, is the low-tension magneto system. The objection to this system—that it involves another reciprocating motion through the combustion-chamber wall—is not stated. The high-tension magneto ignition, combined with accumulators, is probably at present the best.

No mention is made under 'Transmission' of a leather belt, one of the earliest, simplest, and for a man of modest means the most satisfactory mode of transmission. The reviewer has experience of a belt-driven car, which has been running for over five years, and which has covered more than fifty thousand miles, a distance equivalent to more than twice round the world, and it is for all practical purposes in as good condition now as it was when it left the makers; a result no doubt partly due to the care it has received, but principally to the flexible mode of transmission; for of this I am convinced, that had it been a gear-driven car it would have been on the scrap-heap long ago. A belt-transmission can be repaired or replaced by the owner on the road, whereas if anything goes wrong with the transmission by gearing or with the bevel wheel of a live-axle car, the motor is, for the time being, past help.

Descriptions are also given of different types of petrol, steam, and electric cars. The author describes, amongst petrol cars, the Crossley, Napier, Mercedes, Lanchester (of which he says 'there are few motor-cars better suited for the use of private travellers on our English roads'), Daimler, De Dietrich, Wolseley, and two or three others. The Serpollet, White, and S.M. steam cars, and the Electromobile and City and Suburban electric carriages, are likewise described. When the accumulator has been perfected (Mr Edison's does not appear to be catching on) the electric will be the ideal car: it is always ready, the control is simple, there is no smell, and there should be no noise; but the safe range is at present only about twenty-five to thirty miles, so that their radius of activity is limited. For town work, provided there are no steep hills, they have obvious advantages.

Mr Young gives good advice as to the selection of a motor-car. 'Go to a disinterested expert, tell him what you want and what you want it for, and let him advise you as to the make or type of car which you ought to get.' Then follow hints to the rich and to the poor man, and a whole chapter is devoted to certain light cars. For the millionaire the Mercedes is recommended. 'This so far represents the perfection of strength and endurance, silence and sweetness of running, ease of control and range of speed; it is one of the very fastest motor-cars in the world, and it is one of the most expensive whether to purchase or maintain. Its bill for tires alone would more than swallow up what most of us would care to spend on the upkeep of a car altogether.'

In my own opinion the Panhard car should have been ranked first and not second to the Mercedes; the Panhard has always been the A1 automobile. The Léon Bollée car, which has come into the very front rank, is not referred to.

For a doctor a steam car is recommended. This advice is open to question; for a country doctor I would recommend a one or two cylindered petrol car, and for a town practitioner an electric car. A country doctor's car should be of the strongest and simplest construction, and all delicate pieces of apparatus which might render it liable to break down on the road should be avoided. It should therefore be provided with solid tires, high-tension magneto ignition, with accumulators and plain bearings.

It is difficult to understand the craze for ball-bearings. Such bearings are almost essential to a machine driven by muscular power, such as a bicycle, but are unnecessary, and indeed are undesirable, when you are dealing with an engine of several horse-power. They are undesirable to such

a professional man as a doctor, who wants to get there, because under the violent strain of the engine they may break and cut up the bearing, and the car is at a hopeless standstill. They may add a mile or two an hour to your pace, but what is the advantage of that with the present legal limit?

The present craze for high-powered engines and for speed is indefensible. I was talking the other day to a young lady who arrived on a fine Mercedes car. 'We are having our sprocket wheels altered,' said she; 'we cannot get up a speed of more than forty-five miles an hour with our present sprockets.' I said nothing, but I felt that such people ought to be taken care of and not allowed loose on our highways.

Some people, especially young people of the female sex, seem to get intoxicated with the rush of a good car. 'Faster, faster, faster.' The chauffeur is often unjustly blamed, though there are some who care neither for man nor beast. It is difficult to suggest a remedy without unduly interfering with comfort and progress; but a solution may eventually be found either by prohibiting the use of pneumatic tires (one cannot run at much more than twenty miles an hour on solids) or by prohibiting the use of high-powered cars altogether except for drawing heavy weights. Thus, ten to twelve horse-power is ample for an ordinary touring car for four people; where much luggage or more passengers are to be carried the horse-power might be raised to sixteen. A writer to the *Times* suggests that were the wearing of motor-goggles prohibited the question of undue speed would be solved. The writer at any rate has never found it necessary to disfigure himself by donning goggles, although he has motored constantly for the last eight years.

Mr Young thus admonishes the scorcher: 'I am almost ashamed to have to add to this chapter a plea for common decency and humanity; and yet no one who uses the roads, whether with horse, bicycle, motor-car, or on foot, can pretend that it is not necessary, and that it has not been left to the motor-car to evolve the most blatant, the most cruel, the most revolting kind of selfishness that has probably ever been allowed to go unpunished. The motoring cad is the real enemy of motoring. Remember that if you whoop through a village at thirty miles an hour some Sunday morning, and meet a crowd of decent villagers going to church, the clouds of dust that you raise may spoil their Sunday clothes, fill their mouths with grit and their hearts with bitterness. And, above all, I am ashamed to have to say it, have mercy upon timid women, dogs, and little children.'

The cloud of dust that a motor-car too often raises is one of the most serious drawbacks to its use. Not that it is any really new grievance, to be associated with and appertaining solely to the new-fangled invention of the automobile; our forebears before the days of railways suffered from it just as much. Bob Acres, in the *Rivals* (written in 1774), on his arrival at Bath ejaculates, 'Warm work on the roads, Jack. Odds whips and wheels! I've travelled like a comet, with a tail of dust all the way as long as the Mall.' Though much may be done to diminish this nuisance by a reasonable rate of speed, by the use of solid tires, large wheels, and high carriage-bodies, yet the complete cure lies in the introduction of better methods of building the roads.

The road surface should be made of a material that does not yield dust; such surfaces are asphalt or tarred macadam. These are too expensive except for populous neighbourhoods; but Mr Hooley, the road surveyor of Nottingham, appears to have almost solved the problem of finding a dustless, a rainproof, and a cheap material by the employment of an iron-slag mixed with tar. This material he calls tarmac. Experiments have also been made by the *Car Illustrated* newspaper, by the Scottish Automobile Club, and by others on the use of certain dust-laying fluids, such as westrumite and heavy oils. The report of the committee of the western section of the Scottish Automobile Club contains the following remarks: 'Applications of westrumite and of crude oil were made at a cost of about twenty pounds per mile; in the case of the former, for a very considerable time after the application there was absolutely no dust raised by vehicles of any description passing over the road. The crude oil was also most effective, and one application of it suffices for a season, while with the westrumite several applications were necessary.'

Nor are motor-cars the only modern offenders in raising dust; the electric tram-car, in consequence of its high speed and low body, is almost as effective, and yet it has no pneumatic tires. With the disappearance of the dust-plague and the suppression of the motor hooligan, the present-day opposition to the motor-car would fade away, and the whole nation would enter into the enjoyment of the benefits that will accrue from the new method of rapid road-locomotion. Of these benefits, one of the most important will be the improved sanitary condition of our cities. It is not too much to anticipate that a marked reduction in the incidence of certain infectious diseases and in the death-rate would follow the substitution of the engine for the horse.

Mr Scott Montague, M.P., in a letter to the *Times*, says: 'As to the hygienic aspect of dust, I will not say more than to assert that were there no animals employed for haulage there would be practically no noxious bacilli in road detritus. Many undesirable organisms, such as the bacillus *coli communis*, which can nearly always be found in London street dust, breed in the refuse of the horse. One has only to compare the streets of a city where mechanically propelled tram-cars and vehicles are largely used with those where horse-drawn vehicles still predominate, to realise what an extraordinary

increase of cleanliness immediately results when the alteration to the newer mode of traction takes place.'

And what an incalculable amount of unnatural labour and suffering will be saved to the horse! In a city, a wilderness of brick and granite, a horse is quite out of the sphere intended for it by nature. A horse's hoofs were never intended to trot wearily all day on granite setts or on slippery asphalt or greasy wood. The horse should be relegated to springy turf and its native earth to help man to till the soil, or to bear its master on its back; for such purposes the horse is the best of all motors.

Farmers, who now look askance at horseless vehicles, will realise in due season that they are friendly spirits which will waft their produce from the orchards and the farmyards direct to the market without the costly transhipments and vexations delays of the railway.

All in good time it will be recognised that the worst use a road can be put to is to lay a light railway in the form of an electrical tramway along it; the rails handicap and even endanger the use of the road by other vehicles. Such railways should only be laid where land can be purchased for them at the sides of the road; but the motor omnibus, which requires no rails, and which is able to move freely about the road, and so pass other vehicles, will eventually be found to be the ideal mode of rapid local transit for the people. Nor need railway shareholders feel anxious at their advent; they will rather act as feeders than as competitors, a fact which has been already recognised by the directors of the North-Eastern and Great Western Railways.

The joys of driving along the open roads—'the nerves and sinews of the land'—are well described in *The Complete Motorist:*

'The true home of the motor-car is on the open road. There it comes to its own; there it justifies itself; there it fulfils its true and appointed destiny. The miles, once the tyrants of the road, the oppressors of the travellers, are now humbly subject to its triumphant empire, falling away before it, ranking themselves behind it. It flattens out the world, enlarges the horizon, loosens a little the bond of time, sets back a little the barriers of space. And man who created and endowed it, who sits and rides upon it as upon a whirlwind, moving a lever here, turning a wheel there, receives in his person the revenues of the vast kingdom it has conquered. Already on the great main roads the thrill of vitality has been felt. Old inns that had long slumbered in a kind of ruinous trance are beginning to wake up again; old men and women, keepers of shops left high and dry by the ebb of custom, who had thought to end their days in poverty or the workhouse, are here and there, to their profound astonishment, finding themselves afloat on the rising tide of prosperity. The spirit of Telford resides in his Holyhead road. Its daily history is an epitome of human life; daily it bears the physician to the bed of birth, and daily its dust is stirred by the tramp and shuffle of feet moving to an open grave.'

LOW LIVING AND HIGH THINKING:

A UNIQUE HOLIDAY.

IT would be difficult to say where the charm lay. I had been privileged to enjoy vegetarian diet before, had listened to all sorts of lectures on all sorts of subjects, and had indulged in Swedish drill and other exercises, without feeling specially elated. What was there, then, about the Vegetarian Summer School that gave it its unique charm?

The scene is Bowness, on Windermere. Here, in the Grammar School, some forty or fifty men and women, representing every type of mind and character, are met together on the common basis of vegetarianism, physical and mental culture, and hygiene. The adjoining park forms a sort of happy hunting-ground for the practical testing of all sorts of theories—educational, hygienic, humanitarian—and the discussion of all kinds of subjects, from Tolstoy's *View of Art* to astrology and French beans. On yonder bank a few enthusiasts have retired, to be initiated into the mysteries of the Berlitz method of teaching languages. Lively groups of philanthropic maidens are seen shelling peas and airing their views on art at the same time.

Hammocks slung on trees round the park mark the progress of the open-air treatment; but the great event of the morning is 'Gym!' At that magic word, as at a rallying-cry, a mixed company of men and women, varying in age from sixteen to sixty, trip into the park, and, discarding all unnecessary clothing, such as hats, shoes, stockings, coats, and skirts, prepare to enjoy a happy hygienic hour untrammelled by fashion—or much else. Off they go, single file, 'grave old plodders, gay young friskers,' and begin the performance by marching round their leaders, two fair damsels in white bloomers and floating sashes. The march breaks into a trot, the trot into a run, and the run into a hop, skip, and jump movement, with the right and left arm thrown up alternately. After this preliminary canter the *real* work begins: arms, legs, knees, elbows, ankles, wrist, head, throat, diaphragm, are all exercised in turn; not a muscle is overlooked. Then, at the word of command, the whole company suddenly throw themselves on their backs, and continue their evolutions with renewed vigour; and as a final wind-up they fling themselves on their faces, and with prostrate foreheads seem to

salute their mother-earth. I may mention in passing that this performance is appreciated as much by the spectators as the performers.

'Gym' over, the company betake themselves with unabated energy to cricket, net-ball, tennis, and other light pastimes till the one o'clock dinner. 'Dinner!' you exclaim. 'What kind of dinner can vegetarianism provide?' An excellent one, I assure you—savoury, nutritious, wholesome, and delightfully varied. The absence of meat is scarcely observed. Indeed, some of the dishes, such as protose and vejola, have a distinctly meaty flavour, due, I am told, to a clever combination of the pulses and cereals, which are subjected to certain processes of cooking. The following menus for two days' meals are a fair sample:

Breakfast.—Oatmeal porridge, rolls, brown and white bread, nuts, marmalade, butter, melon. Tea and coffee. *Dinner.*—Curried lentils and rice, walnut croquettes and brown sauce, baked apple-dumplings, sago-pudding. *Evening Meal.*—Savoury pie and salad, Scotch woodcock, sultana-cake, brown and white bread, jam. Tea and milk.

Breakfast.—Eggs, bread, rolls, butter, jam, wheatmeal porridge, fruit. Tea and coffee. *Dinner.*—German stew (brown beans and vegetables), protose cutlets, hydropathic pudding, steamed pudding with jam. *Evening Meal.*—Vejola rolls, salad, potted haricots, fruit, nut-cake. Tea and cocoa.

The exertions of the morning might seem to call for an 'hour's repose;' but our vegetarian friends are 'made of sterner stuff,' and the afternoon sees them scouring the countryside in search of 'bits' for their camera, new points of view, &c., or on lake or mountain testing the strength of their muscles.

A gong at a quarter to six is the signal for a general stampede, followed by a transformation-scene reminding one of youthful days at the pantomime. Can these graceful creatures in diaphonous blouses and trailing skirts be our hatless, shoeless, and stockingless friends of the morning? With the garments of civilisation we seem to have donned our mental dress-clothes too. There is to be a lecture, of course, and any one who talks to us now is sure of a hearing; for, like Rosalind, we are in a coming-on mood. Mind-culture, will-power, Beethoven, horoscopes, the ethics of physical culture—all subjects will be equally welcome; or, if the fare should prove rather heavy for the digestion of a weak brother, the antidote is at hand in the excellent concert that succeeds the lecture. Songs, stories, recitations, violin and piano solos follow each other in quick succession, and the climax is reached when the editor of the *Daily Bread-Basket*, clearing his throat, announces that he will now read the contents of his journal. A thrill runs through the assembly, for the *Daily Bread-Basket* is the very flower and fruit, the aroma and essence, so to speak, of the society. To it we confide all our little jokes, our maiden verses, our advice to new members, our pet grievances, our higher criticism—anonymously, of course. And as each letter is read out in turn, and received with bursts of applause from fifty throats strengthened by massage, a look of pride is seen on many a tell-tale face. In that moment of triumph the weary hour in the writing-room is forgotten.

But, hark! the strains of music; and every one who can or can *not* dance is up and whirling. Even the old folks who thought their dancing-days were done look on wistfully, and wonder if they could do 'just one turn;' they feel quite supple after the morning's exercise. 'What was that the lecturer said yesterday? "We are just as old as we feel."' 'Well, my dear, I feel just twenty to-night;' and, with a laugh at the little witticism, off they go.

Such are a few of the scenes which the Windermere Grammar School witnessed last August. Now all is changed; and when October woke the school to new echoes, little would the boys who met there have guessed what scenes those walls last witnessed, what stories they could tell if they could speak! And as I look at the boys in their orderly forms, it is not their faces I see. There, where the little fellow sits frowning over his slate, is a group of men and women listening eagerly to the glowing words of the eloquent exponent of Tolstoy. Their faces express appreciation, sympathy, comprehension—doubt too, and denial. Behind the blackboard, with its formidable array of figures, peeps the laughing face of our secretary's little daughter, as she listens with undisguised admiration to her own little joke read out by the editor of the *Daily Bread-Basket*. Yonder in the corner, where the boy is just rising to repeat his Latin verb, I see the blushing face and soft eyes of a maiden,

> Standing, with reluctant feet,
> Where the brook and river meet;

and the eyes grow very tender as she discovers her own true knight crossing the room to claim his waltz. '*Amo, amas, amat,*' drones Tommy. Yes, the walls could say something about that too!

THE PERFECT FRIENDSHIP.

Have you not seen the sun and gloaming meet,
And mingle in a mystery of hue,
Becoming perfect in the union sweet
Of rose and amber, purple, green, and blue—
Each tint the pearly grayness showing through?

Such is the spirit-tint that glows from love
Like unto that which links us heart to heart.
Incoming trust meets truth.—As lay of dove
Our duet-thoughts sound sadly when apart,
Though gay in unison as songs above.

Friendship thus born to touch both night and day,
Like sunset merging in the moonlit eve,
Glows in our sky, and will not pass away,
But grows more precious as it doth receive
Each gleam of joy into life's common gray.

TREASURE-SEEKING ON COCOS ISLAND.

TREASURE-SEEKERS there have been in all times; the hiders of treasure have been, for the most part, the buccaneers who sailed the high seas, capturing whatever of value came their way. In Elizabethan times there were few navigators who were not pirates; but with the waning of the seventeenth century buccaneering had become a discredited profession. The last of the great pirates was one Benito Bonito, a *nom de guerre* which concealed the identity of a broken-down Spanish gentleman of ancient family, whose career equalled that of any who had gone before him for daring, unscrupulousness, and the amount of booty he managed to seize.

Hiding-places were a necessary part of his equipment, and the preference was given by Benito Bonito to the rocky island of Cocos, lifting its lofty peak from the blue waters of the Pacific. It is known that he concealed eleven millions of dollars there, and ever since his death by his own hand, after the capture of his vessel, frequent attempts have been made to find them. One man alone, a Newfoundlander named Keating, found the treasure-cave. He had learned the secret from one of the two survivors of Bonito's crew, and went twice to Cocos, enriching himself on each occasion, but was unable, through fear of his companions' cupidity, to carry off the prize. He died without fully revealing the secret, though his wife had spent years in trying to worm it from him. To her Keating left a poor scrawl of a map and a statement which he advised her 'not to show to any man without first receiving from him a hundred pounds.'

Those who remember words let fall by Keating allege that the statement his widow received was false and misleading; but she had sufficient faith in it to make, despite her advanced years, an expedition to Cocos. She sailed in the *Aurora*, with Captain Halkett in command, in 1894; but it was not a propitious voyage. Bad weather prevailed, and with six ex-captains on board, all bent on treasure-seeking, it is scarcely to be wondered at that harmony did not prevail. The smallness of the boat unduly prolonged the voyage, and before their return, empty-handed, the adventurers suffered many hardships and were almost starved.

They came on traces of many predecessors in the search. Only two years before, a man named Von Bremer had been there, and spent the greater part of his fortune in making excavations and tunnelling the rocks, but he found nothing. Earlier still, in 1888, a German named Gissler obtained a concession and grant of land from the Costa Rican Government, and later was made Governor of the island; but though he has spent the last sixteen years on Cocos, a second Robinson Crusoe, making ceaseless search, all his efforts have been unavailing.

In 1902 a British Columbian brigantine, the *Blakeley*, took a party of sanguine treasure-seekers, among them the indefatigable Captain Halkett, to the island; but they returned, leaving their extensive borings and diggings as monuments of their vain search.

The latest expedition was made in 1903 by Captain Shrapnel, with Mr Hervey de Montmorency (who has written a graphic account of his adventures) and five other treasure-seekers.

It was not Captain Shrapnel's first visit to the island. In 1896 he was in command of Her Majesty's ship *Haughty* in the Pacific, and was thoroughly conversant with the numerous stories concerning Bonito's treasure current along the American coast. As he had an Irishman's love of adventure, it required little to inspire him with a determination to win the prize. His officers, also hearing the tales, begged him to allow them to steam to Cocos, and in less than three days the *Haughty* cast anchor there. Three hundred sailors and marines were landed; but though for two days they blasted and tunnelled, nothing was found. Captain Shrapnel was reprimanded by the Admiralty for his share in the enterprise, and orders were issued that no more warships should visit Cocos.

Captain Shrapnel did not, however, banish all thoughts of the lost treasure from his mind. When, two years later, he completed his term of command in the Pacific, he resolved to seek

[*All Rights Reserved.*]

in some way to test the value of the various clues which had come into his hand from time to time. For a while an expedition seemed an impossibility. At last, in the autumn of 1902, he persuaded a party of gentlemen to subscribe sufficient money to charter a ship suitable for an expedition to the island. The sanction of the Costa Rican Government was obtained, and an agreement signed between the treasure-seekers and the republic whereby the former obtained the right to search Cocos for one year, and the latter to receive one-half the profits of the expedition. The fitting of the ship was set about without delay, and on 9th May 1903 the *Lytton* left Antwerp, with directions to pick up the adventurers at Salina Cruz, the Pacific terminus of the trans-continental railway which crosses the Isthmus of Tehuantepec.

On the morning of the 9th of August they saw the lofty peak, the abrupt cliff-like shores, the rocks covered with thick tropical vegetation, of Cocos Island. So thick were the trees that they seemed like moss upon a stone, whilst here and there cascades of fresh-water shot off from the high ground and leapt a hundred feet into the sea. The sandy beach upon which the treasure-seekers landed is strewn with enormous boulders, on each of which is carved the name and business of some vessel which had called at the island. Some records go back to Nelson's days; men-of-war, whalers, and pirates alike left their mark there, while the whole stretch of shore tells the tale of former expeditions in search of Bonito's hoard.

Captain Shrapnel had in his hands the various clues upon which others had based their plans, and he had sifted their evidence so thoroughly and laid his own plans so carefully that he and his six companions were confident of success. Keating was known to have found his way to the cave on a dark night; surely they would find it by diligent search in light of day. It could not be far from the shore, for the pirates, pursued by British men-of-war, had been obliged to bury their treasure in haste; nor was it likely that men could carry a heavy weight for any considerable distance over ground so rough and tangled with undergrowth.

Twice the hopes of the party rose high and success seemed within their grasp. Once one of the searchers was seen balancing himself on the steep bank of a watercourse up which they were climbing, and signalling excitedly to his comrades to join him. 'I hardly dare say so; but I believe I have found something,' he cried as they reached him. He was lying on his face, peering under a great rock which covered the entrance to a small cavity. Every one took a peep, seeing without any doubt rows of sacks some ten or twelve feet inside the cave. The smallest of the party crawled in to investigate further, only to return covered with mud and an expression of disgust on his face. The supposed sacks had proved to be but lumps of clay, though he had to touch them to make sure that they were not veritable sacking.

A few days later an actual find was made, but it brought the adventurers no nearer the object of their voyage. Wading up a stream that flowed through a gorge identified with the watercourse climbed by Keating, one of the seekers came upon a decaying tree-trunk which, in falling across the watercourse, had effectually dammed the stream. He levered the log out of its position and released the water which had gathered in a pool, leaving the sand and the shingle which had silted down from the rocks dry and bare. Then he caught sight of something glittering, set fast in the sand. When he dragged it into the light of day it proved to be a portion of a silver crucifix which had doubtless once adorned the altar of some Peruvian church. With strong excitement and revived hopes, the treasure-seekers set to work with pick and shovel and crowbars, attacking first the spot on which the silver had been found, and working far up the watercourse. They worked till dark, and began again with the dawn, but nothing more was found; and, weary and dispirited, they at last gave up the quest.

The period for which they had chartered the *Lytton* had nearly expired. A council of war was therefore held, and Captain Shrapnel expressed his conviction that all within human power had been done, and wisdom lay in confessing themselves beaten. The information given by the clues was wholly insufficient, whilst the extraordinary richness of tropical vegetation, the frequent land disturbances, and the network of streams continually carrying débris down from the interior must in sixty years have altered the features of the island beyond recognition. With a certainty that it was hopeless to search longer, he gave the captain of the *Lytton* orders to steam away to Panamá.

They did not leave Cocos, however, without paying a visit to the extraordinary man who had made his home in its solitude for sixteen years. Set a little back from the beach of Wafer Bay were the corrugated huts Gissler had built during his residence, with the plantations and cultivated patches, proofs of his industry and patience, all about them. When he came first to Cocos he had been as poor and destitute as Robinson Crusoe, and only marvellous energy, invention, and resource had built up this little 'home in the wilderness.' He grows almost every product of tropical lands; he has captured the wild-pig and domesticated it; he has built a boat in which he voyages to the mainland. He owes everything to his own exertions, and values his independence and clings to his solitude as only a modern Crusoe could.

As the *Lytton* came within hail of the shore he waded out to meet her, and directed the captain towards a safe landing-place.

'My name is Gissler,' he said. 'I suppose you have come to find treasure.' Such visitors were not at all to his mind, as the watchful, suspicious look in his deep-set eyes told plainly. His experience of treasure-seekers had not made him desirous

of their company. They had shown but scant honesty, disregarding his rights of property, desecrating his home, and killing his live-stock without compunction. The crew of the *Lytton* managed to set such anxieties at rest, and he told them the wonderful story of his lonely life and the weird fascination which drew him to Cocos and still held him bound.

No one knows so much of Cocos and its hidden treasure as Gissler. It may be said to have moulded his whole life, for a man of such power and intelligence would surely have carved a niche for himself in the great workaday world. He has preferred to live a marooner's life, a second Crusoe, seeking for the hidden wealth, carefully sifting all he has heard about it, and never losing his belief that it is still possible to find it if any one with capital would give one whole year to the search.

Will any one be found to join him in this long search? Gissler hazards no reply and scarcely hopes, for he loves his solitary home and his daily fight with nature, and he wonders, perhaps, whether the acquisition of eleven millions of dollars would add materially to his happiness.

Meanwhile the treasure lies among the rocks, 'so guarded from human eyes as to be powerless till the end of time to cause the flow of blood or tears.'

GIANT CIRCUMSTANCE.

CHAPTER VII.—WIPING IT OFF.

THE quarry was run to earth at last, or —to be exact—to water.

There could be no reasonable doubt about it. The report, indeed, came through diverse channels, any one of which in itself might have carried little conviction, but the general concensus of which hardly admitted of doubt. The reports also varied in degree, of course, according to the bearer's idea of what would be most acceptable to the particular white man who received it. An army reputed at three thousand at the outposts would rise to thirty thousand by the time the chief's tent was reached. No reliance was to be placed on the informants' figures. But they had all been under the harrow. They hated the oppressor to the extent of their wrongs, and with all their hearts and shrivelled souls they desired an end of the present state of things. All their interests lay in the truth, and so they told it—with variations.

The enemy the British forces had come so far to seek and found it so hard to come up with was lying in security at the wells of Tembé, three days' march across the desert, and these three waterless days rendered him, as he believed, impregnable. The Kafir dogs could fight, and they could march; but there was one thing they could not do, and that was go without water. And the tyrant laughed as he thought of the harvest of the thirsty land if they were so foolish as to try it—the harvest and the after-gleanings.

And the chief twisted his brows into cats' cradles till he saw his way, and then set to work to conquer that three days' barrier of waterless desert, and did it.

The fighting at the end of the three days was the smallest of his problems. He took that and the winning of the fight as matters of course. The desert was the first nut he had to crack. If he could crack that nut he had no doubts about cracking the next one. It would simply have to be done, and it would be done, for the wells were the kernel of the nut, and the wells meant life, though they would spell death to many a brave man on either side.

Three days of desert as dry as a limekiln meant much preparation. The troops could take no chances, every contingency must be provided for, and every man worked mightily, and prayed heartily one universal prayer—that the *jibbahs* might still be there to be beaten when they had beaten the desert. And as often as not the petition was strangely worded, and to ears unsympathetic it might have sounded more like cursing. But it was not meant that way, for every man was heartily sick of the abominable land, and desired most fervently to be through and done with it, and back to civilised parts, where you could think of something besides the sand in your throat and the flies on the back of your neck.

They formed a temporary base, and gave it such protection as time and equipment permitted; and then, having weeded the columns of every superfluous thing—human, animal, edible, comfortable—they went on into the desert stripped bare for the fight. And no man washed his face for many days, for it is better to drink with a dirty face than to die of thirst with a clean one. And some there were who, when the time came, washed clean their sinful souls—but not in water—and died doing noble deeds.

On the evening of the second day out, when the tired men were lying in the sand, waiting to wash the rest of it out of their throats, not caring much for food, with little talk, and only the nightly shiver to look forward to, a rider came galloping in from the far-away foremost feeler, the tremulous antennæ of the army, fluttering to and fro in the desert beyond.

He rode through them with a joyous wave of the hand, which oiled their rusty throats, and loosened their cracked lips, and set sparks in their dusty eyes, and so to headquarters, which consisted of a couple of blankets and four lances.

The chief was much too wise a man to keep the good news to himself. It was better than food and drink, and they had all been waiting for it as anxiously as himself. In five minutes the joyous wave of the galloper's hand had received the confirmation of words. The enemy was there, in force, and showed no signs of moving. They would have gone on again at once if he had said the word, but he was a wise man, as I have said. He knew that sometimes to hasten slowly is the surest progress, and that what lay before them would tax to the utmost all that the sun and sand had left in them.

Réveille sounded softly at midnight, and there were no laggards save the camels.

They pressed gaily on, and grudged the long, grizzling midday halt. But the chief was a wise man. The enemy was waiting, and there was no need to hurry. Then on again, and when the sun sank into the western desert they saw for a moment against the great red disc the filmy palm-feathers of the oasis of Tembé, the goal of all their long endeavour. The men gave a deep, rusty growl, a long, subdued roar; the young lions hungered for their prey.

A few hours' rest, foretaste of that which surely awaited some of them, and long before midnight they were pressing steadily through the darkness. Before daybreak they were well in hand, a mile from the wells. The lion was knitting his loins and gathering himself together for the spring.

They had had no expectation of accomplishing a surprise. The enemy's scouts were as supple and keen-eyed as their own. The tom-toms had been going all night long. It was to be a stand-up fight, and God help the loser!

The first glimmer of light showed them their work and found them ready — the hampering convoy well to the rear under a strong guard, the fighting-men stripped for the fight and only waiting the word. They had fed—swallowed food, at all events—in the dark, and every man had had a drink. The next meal would be at Tembé wells—for some of them.

And, to his bitter disappointment and most intense disgust—a disgust so profound that it could not be hidden—Lieutenant Challis found himself nominated to the command of the convoy-guard. For this had been all his record-breaking haste to the front! For this all his back-breaking days and his nights of laborious writing!—to be relegated to the rear and the charge of a mob of grousing camels and their loafing drivers. Some one had to do it, of course; but that the malignity of—shall we say fate, or the devil?—Challis, in his hot heart, called him Everett—should have marked him for the post was almost past bearing.

Duty was duty, however, so he stiffened his face and quietly prepared his little command for contingencies in case of need. He had two hundred men drawn from various regiments, and every man of them as grim-faced and dour over it as himself.

With mighty labours, and objurgations on the part of his sulky assistants sufficient to have blighted out of existence every dervish in the Soudan, he formed his shambling crowd of odorous beasts into a rough zariba, the rampart of laden camels, two-deep, with their fore-legs tied so that they could not rise, and their senseless heads snaking to and fro in ceaseless inquiry as to the meaning of it all. The smell inside the ring was almost overpowering, but the breastwork might prove effectual at a pinch.

The rest of the force was already formed in square, the only possible method of at once attacking and resisting the long, overlapping lines of the enemy's formation. At the first glimmer of dawn, with Venus shining like a lamp, the square set itself in motion, and advanced slowly towards the line of bristling black flags which blocked the way to the wells, and the sulky ones in the zariba watched it with gloomy interest and outspoken regret.

Challis's teeth ground bitterly inside his lean cheeks. It seemed impossible that so grim a face had ever smiled or would ever smile again, and his eyes smouldered like restless fires. Ay! it was bitter, bitter, bitter work, a crushing blow to all his hopes. It seemed to him that all his future had depended on this fight, and the fight was denied him. He did not swear, simply because, in the first place, that was not his way; in the second, because his men were doing all in that line that could be expected of them under the circumstances; and in the third place, because no luridest language ever coined could have expressed a tithe of what he was feeling.

Then, as he watched, he saw the bristling line of flags by the wells heave and swing forward. He heard a noise like the roar and rush of a hurricane, and the plain beyond the square was flooded suddenly with a whity-brown avalanche, so thick, so wide, so overwhelming that the square looked no more than a sand-castle on a seashore, with the wild waves rushing to eat it up.

The mighty phalanxes came sweeping on, in lines so long and widespread that the solid square block in front made hardly a break in them. They would halt for a moment to fire, then on again, leaping and shouting as though no death existed. And for them, truly, death was but a small thing, since he promised greater rewards than life could yield.

From the square came the short, quick rolls of company firing, and it was palled in white smoke spitted with venomous jags of flame. The sand between the convoy and the square rippled and spurted with the high-pitched shots from the attack.

And suddenly Challis's grim face broke joyfully, his smouldering eyes blazed with sudden fire.

The outermost wings of the phalanxes, sweeping round the square, had caught sight of the convoy, and, leaving the attack to be devoured by the main body, were coming down like wolves on the fold behind.

Challis threw up his hand with a gesture of delight.

'Hurrah, boys! We're to have our share after all!'

They answered him with a mighty shout, and their faces were all aglow with the joy of treasure-trove after anticipated loss.

'Now, boys—steady! Keep down there behind the camels! Reserve your fire for the hundred yards, and let every shot tell. I'll give you the word. These men are ours.'

He spoke quietly now; but there was a ring in his voice that strung the heart of every man there for mighty deeds. The bullets began to whistle past him, but he gave no heed to them. He stood quietly watching the foaming wave of intrepid heathendom that came rushing to overwhelm him. And as he waited he became unconsciously, though acutely, aware of several things:

First, that the fire of the square was losing the solid precision of its regulation volleying, and was becoming one long, quick rattle of Martini-Henrys discharged as fast as they could be loaded.

Next, that, in default of better material, camels answer uncommonly well as ramparts. The bullets were singing past his head like homing beetles on a summer evening, and now and again he heard the dull thud which told him they had found their billets. A camel on his left gave a sudden start, looked round at its side, from which the blood was running, and then went on coolly chewing its cud with its usual look of dissatisfied disgust. Another suddenly strained back its head over its hump with a groan and lay still. The rest mopped and mowed inquisitively at the oncoming wave, with its leaping white crest and puffs of smoke and spits of flame.

'Ready, men!'

The wave was nearing the spot he had fixed in his mind as its limit. Well in front came a man on a horse, an aged man with a long white beard, carrying a flag in one hand and a roll of paper in the other.

'Now!' and the men sprang up and gave them volley after volley, steadily, unflinchingly, irresistibly. The leaping white crest broke. Some of it lay prone and moved no more. Parts of it came on fragmentarily, as a sea-wave comes through a wooden groin, its force spent, its ambition lowered. But the grim-faced men behind the camels had no mercy. The empties rattled out like clockwork, the cartridges snapped in, and the hail of lead swept the sand bare of life and tossed up the garments of those who lay dead. A bunch here and there came leaping on, but they all reached their limits in time. Some few turned and sped back to their comrades round the square.

Only one man reached the camels, the old chief with the white eyebrows and long white beard. With his book in one hand and his flag in the other, his eyes glowing like coals, and shouting as he came, he paid no slightest heed to death-dealers or to dead. He kicked his heels energetically into his horse and set it boldly at the rampart. Challis would have saved him for his mighty pluck, but he knew it was useless. Horse and rider collapsed in the very act of leaping, and rolled in a heap against the outer line of camels.

From the square beyond, and its ring of leaping *jibbahs*, rose a mighty turmoil. The firing was worse than ever—continuous, but hurried and spasmodic. The very sound of it conveyed the impression of disorder and vital need—of men fighting wildly for their lives and in danger of losing their heads.

Challis strained towards the tumult and listened intently. The noise waxed louder. He scrambled over the camels and waved his men to follow.

'They're having trouble over there. We must help them. Form line! Open order! Not a word till you can touch them. Then fire, and then the bayonet. Forward! Double!' And they pounded away over the hot sand, over the bodies, some of which were not half as dead as they looked, and jabbed viciously up at them as they passed, and so on to the rear of the screeching legions of which the square formed the centre. Then a ripping volley, a hoarse yell from the long thin line, and the bayonets got in on the outer ring of the dervish attack.

The yeasty mob melted like snow under a steam-hose. That face of the square surged out to the position from which it had been dented in, and locked itself tight again. The faces of the men inside were strained and dripping with sweat; the ground was cumbered with dead. The men of the square ceased firing at sight of their comrades in the mêlée, and none too soon. Several of the rescue-party had gone down before their bullets already. The rest were making fine play with the bayonet. The attack at that side was at an end, but elsewhere the fight was still proceeding furiously.

It was impossible for Challis to collect his men. He did his best, gathered about half of them to the corner, and mutely set them to an enfilading fire along the attack on that side, for orders were impossible in so infernal a tumult.

A Homeric struggle was going on outside the square round a Gardner-gun, and in the thick of it he caught sight of Evan Cameron whirling a clubbed rifle furiously round his head and pulping everything that came within his reach. His fair hair dabbled suddenly with blood, which ran down over his face and got into his eyes. Challis gave a shout and dashed into the mob. Half-a-dozen of his men followed, and the gun was saved, but Cameron was lying beneath it by the time they got there.

A long, hoarse shout rang out from the square, and Challis looked up and saw the dervishes streaking away over the sand as fast as their legs could carry them. The day was won; but it had been touch and go, and it was Geoffrey Challis and his convoy-guard who turned the scale at the critical moment.

SEVEN.

HIPPOCRATES declared that the septenary number, by its occult virtues, 'lends to the accomplishment of all things, and is the dispenser of life and foundation of all its changes.'

Like the number three, seven has from time immemorial held a conspicuous and sacred place in the scheme of things. Just exactly why this should be so it is difficult to determine, because, although we find a definite reason in many cases, in others it would appear to be purely accidental. Human nature, moreover, when keenly set on establishing a theory, is ever prone to look around in all directions, picking up everything that seems to fit the mosaic. That the ancients considered uneven numbers to have special force and efficacy there is abundant proof. Shepherds of ancient Greece were especially enjoined to see that the number of their sheep 'be not even.' That there were seven sages of ancient Greece and just seven wonders of the ancient world savours very much of chance or coincidence. Although three was considered most acceptable to the gods, Aristotle tells how, because weakly infants commonly died before this date, the seventh day was therefore honoured with the solemn festival of naming a child. Even in this twentieth century the luck in odd numbers—thirteen alone excepted—is largely believed in—seven as frequently as three; and as recently as last year a 'wise woman' of the Emerald Isle seriously asserted that there was no cure for a certain child's complaint unless the seventh son of a seventh son could be discovered for the deed. But a curious old rhyme respecting magpies would seem to contradict this magic potency of seven:

> One for sorrow, two for truth,
> Three for a wedding, four for a birth,
> Five for heaven, six for hell,
> Seven for the deil's own sel'.

Mrs Hemans, in apostrophising ancient Rome, thus refers, it will be remembered, to her unique position:

> On thy seven hills of yore
> Thou sat'st a queen.

Another classic instance, similarly curious, may be recalled:

> Seven wealthy towns contend for Homer dead,
> Through which the living Homer begged his bread.

History records many more. One in evidence just now is that long secretly guarded Chapel of the Pyx, dedicated by Edward the Confessor to St Peter, and, on this account obviously, only entered, even in later years, by those stately officers of State when seven huge keys had unfastened its heavy double door.

It is to be regretted that little now remains of the original locality 'where famed St Giles's ancient limits spread,' and where 'an inrailed column reared its lofty head:'

> Here to seven streets seven dials count the day,
> And from each other catch the circling ray;

but the name of Seven Dials is in itself sufficient testimony to one more honour paid to this typical number.

That folks were in olden times occasionally 'scared out of their seven senses' clearly indicates the number of senses at one time recognised, supposedly under the influence of the seven planets. On this and other theories the ancient Hebrews, Egyptians, Persians, and Greeks founded their respect and reverence for the number seven. The seven bodies of alchemy may be appropriately referred to here.

One of the more prominent proofs of the original significance of seven in use at the present day is the 'seven years' lease,' instituted because life was supposed to be in danger and to undergo a change every seven years. Hence we have Shakespeare following up this supposition, and affirming in those oft-repeated lines:

> And one man in his time plays many parts,
> His acts being seven ages.

Closely allied, of course, is the 'seven years' apprenticeship,' and that dreaded 'seven years' penal servitude'—made so conspicuous in the case of Adolf Beck—which, when the sin merits such severity, becomes twice and three times seven.

It may be observed, in passing, that seven witnesses were required by the Hebrews to attest an oath. The one instance, probably, when seven judges were deputed to sit in judgment was that of those appointed by the justice-loving though unpardoning Maria-Caroline of Naples for the 'Junta of State' over persons accused of treason. The 'deadly' sins of the Catholic Church were, strange to say, formerly eight, until, somewhere in the Middle Ages, there dawned a happier day, and the monks, in a lenient mood and with a leaning towards the mystical number, elected that there should be only seven.

Dumas, in his *Isabel of Bavaria*, refers to an ancient privilege which authorised the deputies of the six merchant bodies to accompany the kings and queens of France upon their entry into Paris from the gate of St Denis to the palace, followed on this occasion by the representatives of the different manufacturing bodies clothed to represent the 'seven capital sins,' and, by way of contrast, the 'seven Christian virtues.' The recognised 'sins' and 'virtues' appear to have varied slightly at various periods of religious history, though in number usually 'seven.'

Kingsley, it will be remembered, says, 'Every duty which is bidden to wait returns with seven fresh duties at its back.' The Mohammedans be-

lieve in an angel who, before recording man's ill deeds, waits 'seven hours, peradventure he may ask pardon.'

To be in the 'seventh heaven of delight' is a qualitative term still in use for superlative expression, and may be traced to the cabbalistic belief in seven heavens, although Ptolemy recognised only five, the Hebrews three, and other systems nine of these states. To refer again to Shakespeare, he on more than one occasion showed considerable preference for seven, convinced, seemingly, of the 'divinity in odd numbers.' He speaks of tears salted seven times. His prophetic wish that there shall be in England 'seven halfpenny loaves sold for a penny' assuredly came from a kindly heart, as well as that thoughtful reflection of the potential good lurking in 'seven hundred pounds and possibilities.' In an age so greedy of gold as the present, the same could hardly be expressed in less than seven figures, while in the eyes of the extremest section of these money-minded mortals perhaps seven millions of pounds is barely adequate for their designation of bliss.

Space will not permit the enumeration of all the instances in which seven is pre-eminently set forth in the Scriptures. It is interwoven with almost every Biblical story. Beginning with the Creation, we find that the seventh day was consecrated to rest. Noah had seven days' warning of the Flood, and, by command, took fowls of the air and 'clean' beasts by sevens. The ark touched ground on the seventh month; and after seven days a dove was sent out, and again after seven days more. On the seventh day of the seventh month a holy observance was ordained to the Children of Israel. The seventh year was a sabbath of rest for all things. At the end of seven times seven began the grand jubilee. Every seventh year the land lay fallow. Every seventh year saw a general release from all debts. Jacob served seven and yet seven years for Rachel. Pharaoh's dream predicted seven years of plenty and seven of famine. When the sluggard is spoken of as wiser in his own conceit than seven men that can render a reason, the number would seem to be selected without any special purpose. The fiery furnace for Shadrach, Meshach, and Abed-nego was heated seven times hotter than usual, with rather more significance; just as the old law bade man forgive his brother seven times seven, and the newer law seventy times seven. At the destruction of Jericho seven is curiously emphasised. Seven priests bore seven trumpets seven days, and on the seventh surrounded the walls seven times. Balaam when sacrificing prepared seven altars. Turning to Job, we see his friends sitting with him seven days and seven nights, and offering seven bullocks and seven rams as atonement. King Ahasuerus in the seventh year of his reign feasted seven days, and on the seventh directed seven chamberlains to find a queen, who was allowed seven maidens to attend her. For leprosy, seven dips in Jordan were enjoined upon Naaman. The lamps of the Tabernacle numbered seven. Seven different persons are brought back to life. Enoch was the seventh after Adam, and Christ (also 'translated') the seventy-seventh. From the Cross He spoke seven times. He appeared seven times. Another striking instance is when Christ cast out seven devils. Frequently seven appears to be typical of thoroughness and completeness.

The Apocalypse likewise revels in this revered number. It may also be noted that the apostles planted seven Churches in Asia, and that the sacred books or Bibles of the world are seven in number —namely, our Christian Bible, the Koran, the Eddas of the Scandinavians, the Five Kings of the Chinese, the Tripitaka of the Buddhists, the Vedas of the Hindus, and the Zend-Avesta of the Persians.

Continually as we contemplate the moon, seldom do we heed the fact that she has seven phases, and even sometimes forget that the rainbow, too, is septenary in character. Yet our ancestors gave serious, albeit possibly superstitious, regard to these circumstances. But in the mystic realm of music seven notes confront us far too constantly to be callously overlooked, and that dominant seventh is perpetually giving particular evidence of itself. Wynn Westcott points out that seven pipes are seen in the instrument played upon by the older deity Pan. Dice, though of ancient origin and found in very early Egyptian tombs, were not originally numbered. This evolution of a considerably later period obviously keeps the gambler also perpetually in mind of seven. Anciently, the symbol of the universe was a ship with seven pilots.

Conspicuous in the field of fiction is that attractive old Syrian legend which tells how those seven Christian youths of Ephesus fled from the rage of Decius and lived in a cave until discovered; then, when great stones were, by the enemy, rolled before its mouth, they fell asleep, the story says, for one hundred and ninety-six years, to waken once more living testimonies of a resurrection from the dead. The Island of the Seven Cities is another curious legend regarding a fabulous land of the Atlantic which gave refuge to a body of Christians in flight from the Saracen conquerors, who had, at the instigation of their seven bishops, committed themselves to the mercy of the sea. It is somewhat singular, considering the pre-eminent position this number has for ages occupied, that the bishops who at a memorable epoch of English ecclesiastical history so stoutly stood on their trial for freedom should have numbered neither more nor less than seven. Was this one of those cases one ought to set down to coincidence? Whether or not, wherever one turns one stumbles on seven. One more instance will suffice, of the poet who advocates:

> Seven hours to law,
> To soothing slumber seven,
> Ten to the world allot,
> And all to Heaven.

BETWEEN TWO.

By F. C. ARMSTRONG.

I.

'IT is becoming perfectly distracting.'

The aunt was bustling about her pretty room, armed with a feather-brush. The niece leaned over the piano, carelessly turning the leaves of a big portfolio. She was a tall, superbly built young woman, with brilliant dark eyes that could soften dangerously, a mobile, sensitive mouth with lips red as a June rose, and a very seductive dimple playing hide-and-seek in the rich colouring of her cheek.

The aunt was well on in middle-age, yet a very personable woman for all the accumulated years. Between aunt and niece there existed that strange resemblance we sometimes see in members of the same family, suggesting a likeness in character more than in outward form and colour.

'Distracting?' The girl's voice was soft and round. As she spoke her lips arched and curved prettily, while the dimple manifested itself. 'To whom?'

'To me, to them, to every one.' Miss Laura Shepperton spoke with some little irritation, flicking her brush over a range of very precious, little, old china shepherdesses. 'You can't marry both of them, child.'

'Do you know, I'm not at all sure that I want to marry either of them,' replied the niece, as she drew a song out of the portfolio.

'Well, make them understand that fact once for all,' cried Aunt Lulu, as she carefully adjusted one of her shepherdesses. She loved those quaint little figures, which were valuable ornaments, being all of them more than a century old.

'Do you really mean that the comings and goings of these young men worry you, aunty?' Beatrice Unwin demanded, as she settled herself upon her music-stool. 'I'll send them packing if it really fidgets you.'

'Fidgets me! How exactly the word expresses what it does do to me!' the aunt cried. 'I like both the young men. In fact, I don't know which I would prefer if I were in your place—which, happily, I am not.'

Beatrice laughed. Her laugh was pleasant to hear.

'Do you think my prospects run a risk of coming to grief between the two?' she asked, running her fingers lightly over the keyboard. 'I'm quite aware of the advantages possessed by both the dear boys who have honoured me by their attentions. Mr Seymour has the start of Captain Marker by exactly three days. I met him at the boat-race luncheon. Such a make-believe of a race as it was, aunty! He has a nice little voice of his own—a light tenor; but then, Captain Marker dances—oh, divinely! Mr Seymour is possessed of a soul, with a capital S written very large. His range of reading is simply prodigious;' and she flung her pretty hands wide. 'He poured out a whole volume of quotations from every known and unknown British poet the other day when he brought me that bunch of roses over there. By the way, they begin to look rather dilapidated, don't they? I'll bring some fresh flowers in from the garden presently. But as to the dear soldier, he just dumped down his bouquet with, "I thought you'd like some flowers, Miss Unwin. Your birthday, you know." Simple and straight, wasn't it?' She mimicked the man's voice and gesture to perfection.

Her aunt burst out laughing.

'My dear child, if you cared a pin about either of them you wouldn't make fun of them or their gifts,' she said, as she divested herself of her smart apron and put it away, together with the feather-brush and her soft duster. Then she threw herself into an easy-chair, and rested her comely head on the cushions thereof. The room was a very dainty apartment. There was all the appearance of ease and ample means about it, although the owner was not above dusting her pet Chelsea china.

'Beatrice,' she said, with some earnestness in her voice—'Beatrice, I want to say a few quiet words to you. No,' she cried, as the girl half-rose from her seat; 'stay where you are, but keep your fingers off the keys. It fidgets me, and I want your whole attention, only for a moment or two.'

'Dear aunty, there really isn't anything to be serious about,' cried the girl gaily.

'Dear Trixy, there is,' returned the aunt, with a vibration in her voice which startled the girl.

She whisked round upon her music-stool and listened with an unexpected expression of concentration on her beautiful face.

'I want you to marry,' said the elder woman, still with the deepened ring in her mellow voice. 'I don't want you to miss your woman's heritage of love and the joy of life. I want you to have a secure home of your own, not remain a hanger-on to the skirts of a whimsical old woman.'

'Which could never mean you, Aunt Lulu,' cried the girl.

'I don't know. One can never be sure of oneself. We are uncertain beings, we women; always breaking out into the unexpected. Remember, it was the unexpected vagary of a woman which placed me in my present position. Now, I want you to be above all such fluctuations. I want you to be happy, child.'

'I am very happy, Aunt Lulu.'

'Indeed, it is the aim of my life to make you so,' answered her aunt; 'but life is crammed with ups and downs. Suppose I were to lose my fortune; that it was to vanish as unexpectedly as it came?

It is not impossible. Dear child, if so, just think what it would mean to me to see you safely placed above all such chances! But I am far from wishing you to marry for the sake of being married; still less would I wish to see you tied to any one unworthy of you. Now, these young men are both deserving of better things than to be played with. They are both fine young fellows; but, necessarily, one must appeal more to you than the other.'

'Indeed, dearest auntie, I couldn't say there was a hair to choose between them,' cried the girl, flushing up. 'They are both upon exactly the same plane, so far as that goes—good to play with.'

'Have I not said I distinctly believe them worthy of better treatment at your hands, Trixy?' Miss Shepperton spoke with some heat. 'I should hate to think you capable of amusing yourself at their expense. A coquette is a detestable person—also, despicable. Surely, my sister's child is above such suspicion?'

Beatrice's bright eyes filled with tears. 'Indeed, auntie, I hope so,' she said. 'Although people think too little of—of such frivolities nowadays.'

'Is there any one else, Trixy?' asked the elder woman, with a quiver in her voice. 'Any one whom you met in the hard old times?'

'I—was very young,' Beatrice said hesitatingly, 'and very miserable.' Her voice sank low. 'It wasn't home at all with the step-mother.'

'I know.' Miss Shepperton nodded her comely head. 'You certainly had not much time to think of anything but your duties in the nursery, you poor child; but—there sometimes happens to be—a curate, for instance?'

'Oh auntie! No, no, there never was a curate; at least—there was—a dear, good man, too; but he had a wife and six small children—darling little things, not in the least like the step's.'

'Or a doctor? Sometimes there is a doctor.'

'So there was. An old darling, with such beautiful white hair and a most beloved old wife. They were very good to me. Indeed they were!' and the bright eyes were misty again. 'The step hated me to speak to any one,' she went on. 'Oh auntie, you took me out of a dreadful state of things!'

'Then I may safely conclude that there was no one?' said Miss Shepperton.

'No, no one to speak of,' answered her niece vaguely. 'They are coming round for croquet this afternoon,' she went on. 'The Driscols are bringing the American girl.'

'Croquet?' cried the aunt. 'I played it in a hat. Very smart it was then. It was poked up at the back by the great chignon I wore. What a guy I must have looked, judged by our present canons of style!' and she laughed, yet there was a sad little ring in her mirth. 'The Driscols and their American friend coming over in the afternoon?' she cried, starting to her feet. 'I must see that we have a respectable tea for them.'

Left to her own company, Trixy whisked round on her revolving music-stool and began to play. Her aunt's questioning had raised sundry ghosts in the secret places of her heart. She began to sing softly in a low, penetrating voice:

'I mind the day I'd wish to be a sea-gull flyin' far,
For then I'd fly an' find you in the West.
I'd wish to be a wee red rose, as sweet as roses are,
For then you'd maybe wear it on your breast,
Achray,
You'd maybe pluck an' wear it on your breast.'

Her voice fell to a sighing little note as the yearning refrain went whispering through the room. Only for a moment, because, striking out a thundering chord, she dashed into a brilliant waltz full of swing and spirit, which would have inspired the feet of a cripple. Then she shut the piano and whirled across the room to the open window; there she stood for some time, gazing out across the pretty garden and pleasure-ground which sloped down to the river. Her face saddened, softened; a vague, far-away expression came into her eyes. 'I mind the day,' she sang softly; 'I mind the day.' Then, flinging up her head, she went out into the sunshine and bright air with the air of a woman determined to banish care and defy all vain and wandering thoughts.

II.

UNDER the spreading trees a pretty tea-table was laid. Ripples of laughter and a pleasant sound of voices combined with the tinkle of silver upon china and the purr of the kettle over its flickering lamp. Miss Shepperton made an ideal hostess, and her guests looked happy. The elders abode under the shelter of the drooping limes, while the younger ones disported themselves on the smooth-shaven lawn, intent upon driving a long-suffering ball through sundry narrow hoops.

The two youths who had been discussed in the morning hours seemed quite at home. There were others who looked on as the quartet played the game; but those four players made the interest of the moment. The American girl, Miss Jaggers, was a study in frill and furbelow. Yards of trimming went to complete the perfection of her dress, while her hat was a study—quite up-to-date, if not a little before it. A very pretty girl for all that, even if Stephen Marker found her a little artificial. Trixy Unwin was more to his liking. Very tall and stately she looked in her simple white frock, with the big flapping hat which brought out the depth of her colouring to perfection. Seymour thought her a poem as she poised her malet for a decisive stroke; while, unknown to him, all the time her thoughts were slipping back to the wistful little refrain, 'I mind the day, I mind the day.' The two young men were decidedly above the average. The city youth, whose reading was of such an extensive character, had a fair share of good looks. The soldier, lean-flanked, flat-backed, erect, alert, with well-poised head and graceful carriage emphasised by careful training, made him-

self exceedingly pleasant to his partner in the game, the young American; but she noted how his eyes went involuntarily towards Beatrice, and she smiled. Perhaps it would be too much to say there was a sense of tension in the air; but, of a truth, three out of the four players understood that a change was impending. Matters could not go on upon the present lines very much longer. The girl who played such a steady stroke had touched the fancy of both these youths. As yet it was nothing but fancy with either of them. A turn of the wheel of fate might alter everything, and neither of them dared deny that Trixy Unwin occupied a most important place in his life.

Frederick Seymour was vaguely 'in business'—'Something to do with shipping,' Mr Driscol said; and it had been at Mr Driscol's house that Trixy encountered him. Whatever it was, it was a 'good thing,' and his family was rich. Marker was not poor. There was a brewery in the family, and an uncle who had a share in a well-known bank. Mrs Driscol, early in the day, had mentioned that Afra Jaggers, although not just a millionaire, was amply portioned. Indeed, the charming young stranger looked rich, and money is not to be despised.

The game played itself out. Marker could not help winning; but when another set formed up on the ground it was he who gravitated to Trixy's side. Seymour and the American heiress went to the tea-table together, the young man making himself very pleasant to the stranger, who liked it well; but Seymour's eyes followed the other pair as they wandered away to the riverside after tea. He was not sure; he had his doubts. Trixy had not been a shade less cordial in her greeting; she had been just her usual self, and yet—Marker was a dangerous rival.

But meantime here was this bright, brisk American anxious to please and be pleased: a girl worth any man's thoughts, if only that other were not within reach.

Miss Shepperton listened with half an ear to Mrs Driscol's renewed lament over her domestic miseries, but more seriously inclined to the talk of the elderly men, who were discussing Irish politics from a British point of view. She hated the twaddle about matters domestic which forms the mental fare of outer Suburbia.

'I'm rather struck with the quiet way you English take everything.' Miss Jaggers looked very sweet under the shade of the drooping ash. Her eyes were blue as a forget-me-not, her complexion delicate as an orchid; her wonderful frock fell in perfect folds round her feet. Seymour liked to see a girl well dressed. 'I do admire your national nerve; it's so steady,' she remarked.

Seymour quoted Kipling *à propos* of the excitable nature of her own country-people. She said a poet wrote many things; but acknowledged a vein of truth in the lines.

They also wandered away towards the river, while the elders talked in the shade, Miss Shepperton quietly guiding the conversation with great tact and skill. She was an admirable hostess, this woman who had battled sorely against adverse circumstances for the best years of her life. She had seen love pass her by; she had missed her woman's heritage; but the bitterness was gone, although the scars remained. When she had turned the half-century, the whim of an old friend had placed her at the head of an ample fortune. She had the satisfaction of knowing that her friend's will had wronged no one; she had been a lonely woman, with no claims upon her; therefore Laura Shepperton took the good of what fell to her without scruple. Her first step upon coming into this unexpected fortune had been to take home her only niece, the daughter of a dead sister, who was drudging as unpaid governess in the house of a harsh step-mother. She would make the girl happy, see that she did not spoil her young life, she thought, as she watched the couple moving slowly along the river-side in mingled sun and shade.

III.

'WELL, which of them is it to be?'

Aunt and niece were alone. The guests were all homeward-bound, and later it was probable they were to meet again, for a small dance was to be given in honour of the young American, and Miss Shepperton had an idea that the evening would end the matter. 'Which is it to be?' she asked.

'Oh dear! I don't in the least know,' Trixy laughed. 'I believe they both proposed to me; at any rate, they both said something that might be taken as an offer; and, upon my word, I shouldn't be surprised to hear that they both consider me engaged to them.'

'Child! have you made confusion worse confounded?' Miss Shepperton did not know whether the girl deserved a sharp scolding or not.

'I wasn't thinking of either of them,' Trixy cried. 'First it was Captain Steve. He talked so very incoherently that I didn't understand, you see; and I didn't want to offend him, because he's such a good fellow, auntie; not what you call brilliant, but so good!'

'Then you do like him best?' said Aunt Laura.

'Well, just at the moment I liked him very well, and he did stammer and stutter so, and was so frightened: that big, brave fellow, who has been through so many terrible battles, to be afraid of a bit of a girl! Indeed, Aunt Laura, he was in a mortal funk.'

'Beatrice,' said her aunt, 'you are not in love with Stephen Marker!'

'Oh, but I do like him very much,' she cried hastily. 'But when you come to put it solemnly like that'—— Her voice died away in a little quiver.

'Well, go on. What about the other?'

'It was after he had made himself so pleasant to Miss Jaggers; perhaps he thought he had given me cause for jealousy. Isn't she very handsome, auntie?'

'Remarkably handsome; but that isn't to the point. Tell me about Fritz Seymour.' There was a certain sternness in Miss Shepperton's voice.

'It was after Captain Marker had left. By the way, he can't be at the dance to-night. It 's such a pity, because he dances so well.' Trixy paused for a moment. 'He left quite happy and pleased with himself—and me, although I am positive I did not say one word he could take seriously. Then Mr Fritz had his innings. I asked him if he had had a pleasant afternoon, and—well, he talked a bit—pure nonsense, auntie—at which I laughed. Then I asked him if Miss Jaggers didn't look just like a flower. He said she did—like a fair exotic; but, for his part, he preferred the English rose; and—well, he got hold of my hand. No,' she cried hastily, 'I didn't let it stay; but he contrived to say there was one English rose he wished to wear all his life—which meant me.' And she laughed. 'He said it so neatly that I sent him away quite happy; but you needn't be afraid of my making myself in the least remarkable this evening. I'll contrive to give him only three dances. I'll not give occasion for any talk I can help, you see.'

'Beatrice, you don't care about him either. I know! I know!'

'Dearest auntie, it isn't so very serious, is it? I can manage to wriggle out of the whole affair—satisfy them both.'

'No, you can't marry them both. In a word, you don't mean to marry either.'

'You darling old thing, how in the world have you arrived at that conclusion?'

'Because you are not seriously attached to either, and you never must tie yourself to any one whom you do not love.' Miss Shepperton spoke with a sad ring in her voice. 'Ah, child! child!'

'Auntie, I have often wondered how it is that you never married—you who must have been such a pretty girl, who are so pretty still?' Trixy asked affectionately.

The elder woman looked out of the window across the lawn, where the summer twilight was settling down into soft shadows, leaving a vague, mysterious touch upon well-known objects that made them seem far off and unfamiliar. Like the view without, a certain veil of mysterious expression passed over the comely face—the shadow of a cloud. She turned her face away. 'It is just possible that I may tell you—if I think it will help you,' she said in a veiled voice. 'Now, isn't it time to dress for this dance? Unless you mean to marry Mr Seymour, don't make yourself remarkable with him.'

'Have I ever made myself remarkable with any one, auntie?' Trixy inquired.

Miss Shepperton did not proceed very rapidly with her toilet. Her hands shook as she rearranged her hair; her eyes had a far-away look in them. 'Is there any one else?' she thought, as her niece's perplexities flashed across her brain. 'Is there any one else?'

Of her niece's two admirers, she herself preferred the soldier. 'He is so straightforward,' she said; and then she thought straightforwardness may be only in seeming. Alas! alas! She sat down in her pretty black dress—she always wore black in the evening—and for a moment or two was lost in thought. What was going on round her had 'stirred the Hades of her heart.' She could remember when halting between two had spoilt more lives than one, spoilt one irrevocably. 'I did the right—I did the right,' she murmured, her hands clasping and unclasping feverishly. Oh, what an old fool I am to look back and regret, after all those weary years!'

Trixy came rustling into the room, radiant, sparkling, her eyes ashine, her colour high. Laura Shepperton came back to the present with a start. It was good to be young and fair. The sight of that face was good for eyes that had been dimmed with tears when she was about this girl's age, so dimmed as to blind their owner for ever to one side of life.

(To be continued.)

THE GOOD OLD TIMES.

IF it be true that 'the proper study of mankind is man,' we should all be ardent students of human nature, and as a matter of fact most of us are; for although comparatively few trouble themselves about the philosophy of life, the majority delight in the daily newspaper, the play, or the novel; and each one of these is but a review of the doings of men and women, and a chronicle of the manner in which their lives are moulded by their environment. And the most trustworthy authority of all is the newspaper; for it is not the production of one mind, tinctured by what is known as the personal equation, but is made up of the thoughts of many. It affords, moreover, a picture of real life; and just as a child will always prefer a true story to one which is 'make-believe,' so we turn to the daily journal as a necessity, leaving other reading for what leisure we have to spare.

Although newspapers of a kind were published in this country as early as the seventeenth century, there are only two or three journals now in existence which are more than a century old, and one of these is the *Times*, which owns the proud position of being the leading organ of intelligence. And it is a matter of absorbing interest to turn for a moment from the bustle of life, as we know it to-day, and look back at some of the early issues of this paper in order to view the 'fleeting show' which the world afforded one hundred years ago. The proprietors of

the *Times* have recognised this natural craving of the present to peep into the past, and since the dawn of the twentieth century they have published daily short extracts from their columns of the same day one hundred years ago. These extracts are replete with interest, and many of them are as amusing as if they had been culled from the pages of a novel. We propose to select a few which have recently appeared.

It is abundantly evident that the *Times* in its infancy was far from being the sedate newspaper as we know it to-day. Some of the excerpts are of a frivolous nature; and occasionally the editor descends to the puerility of a pun! Sometimes, too, it waxes wroth as well as sarcastic at the expense of a contemporary. Thus, alluding to the *True Briton*, it says: 'Will it be credited that this official demi-official Ideot [*sic*] could add anything to his daily portion of absurdity?' and accuses the same journal of attempting to undermine the Ministry, 'by whom it has the baseness to affect to be employed or demi-employed. We shall not rake this dunghill.' On another occasion it quarrels with two morning papers on the ground that they 'tell their readers that a number of *dexterous* skaters crowded the ice on the Serpentine river the preceding day. This reminds us,' it continues, 'of an Hibernian dancing-master who boasted his professional agility by saying he was very *handy* with his *feet*.' And we find that we must also take the *Times* of 1803 to task for its want of politeness to the fair sex, for we find it publishing the following piece of rudeness: 'We have not heard that the unlucky Foreigner who teaches ladies to speak in their own houses has found a single scholar. Had the man taught them to hold their tongues he would have been employed by half the husbands in London, and adored by the servants!' In another extract we find that the ladies are rebuked for the way in which they follow the dictates of fashion in the matter of dress: 'It is certain that some of our travelling nudes of fashion intended to conquer the Conqueror of the Continent. What glory would it have brought to this country if it could have boasted of giving a wife to the First Consul! How pretty would sound Lady G—— (we mean Lady Godiva) Bonaparte!' Sarcasm at the expense of fashionable frivolity in another entry takes anecdotal form: 'A young lady who puts on a great deal too much *rouge* with too little care and art was lately boasting that she owed what little colour she had to her custom of washing her face in cold water; but perceiving some little hesitation or astonishment in the company, she said to a gentleman, "You don't seem to believe me." "Oh, madam!" said he, "I have not the least doubt; it is very clear your ladyship always washes in the Red Sea."'

There are many allusions to Bonaparte in these cuttings from 1803, for in that year, it will be remembered, France declared war against us; but space forbids us to enter here upon matters of mere history. We cannot, however, resist the temptation to quote the following: 'Many people imagine that there is something peculiarly menacing and hostile to our coasts in Bonaparte's project for teaching his armies to swim; but we will venture our credit that his army will never get more than *half-seas over*.'

Although war was actually declared in May of that year, it evidently came as a surprise to many, for two months earlier we find that 'all the passengers who have come over in the late packets from France affirm that not the least suspicion prevailed in the public mind at Paris that there was any probability of a rupture between the two countries.' But under the same date we note that 'two hundred Pensioners from Greenwich Hospital are gone to Chatham and Sheerness to assist in rigging such ships as are ordered into commission.' The idea of enlisting the services of Greenwich pensioners in preparing battleships for active service would nowadays be thought very quaint if introduced as an episode in a comic opera. Another extract shows that the authorities by no means considered the inmates of Greenwich Hospital as being unfit for further service: 'It is in contemplation to call in the out-pensioners of Greenwich Hospital, in order that such as are able may do duty on board of guard-ships lying at the different ports, and also to expedite the fitting out of ships as may be short of their complement.' One more entry referring to naval matters is of interest: '*Thursday, Apl.* 28 [1803].—The *Victory*, of 100 guns, will take her guns on board this day, and will be ready for sea on Saturday next.'

Here is an extract which shows that the smart society journal was not altogether unknown in the early days of last century: 'One of the dashing papers of last week gives the important intelligence that a certain family has *changed its cook*, and that a Taylor has made alterations in his House! This information is called *fashionable*—but God help us if it is!' Some of the extracts dealing with the social and domestic manners of the time are of great interest, and it is impossible not to feel that we have advanced somewhat in the matter of politeness. One cannot imagine such a scene in these days as that described in the *Times* of 18th April 1803: 'There was a shameful disturbance at the Opera House on Saturday night, in the middle of the first act of the ballet, owing to an attempt of a person in the dress of a gentleman to cross a scene in full view of the audience. One of the servants of the theatre, endeavouring to prevent him, was knocked down; but, immediately recovering, a ring was called for, and, both being joined by friends, a battle actually took place on the stage.' Is there a novelist so bold as to introduce an episode like this into his pages? And if he did so, would not the critics blame him for inventing such a preposterous situation? But truth was ever stranger than fiction. A few months before this strange pitched battle on the Opera House stage, we find an entry referring to 'that abominable nuisance Bartholomew Fair:' 'Among other novelties introduced at the fair

was a number of balloons, as if the shew itself were not sufficient to turn the heads of the people and cause dissipation without this addition to the other entertainments.' Bartholomew Fair, Smithfield, was originally instituted for the legitimate purposes of trade; but it gradually assumed the character of a rowdy and profligate assembly, and was abolished.

We may also congratulate ourselves upon the purity of our Civil Service as compared with that of a century ago. The following advertisement, which appeared in October 1802, shows that the sale of public appointments was not unknown: 'PLACE IN A PUBLIC OFFICE.—Any gentleman who can procure an appointment to a situation in any public office of which the income will not be less than three hundred pounds per annum, and if of considerably higher value it would be much preferred, may meet a gentleman who will be glad to purchase the same, by addressing to C. Warner, Esq., to be left at No. 77 High Holborn.'

There are many references to election matters and the rough-and-ready methods practised by the various candidates for parliamentary honours. Thus we read of a curious episode which occurred at a contested election in Huntingdonshire: 'Sir Robert Bernard had kept back a reserve of votes for the last day of the poll, who were to come in from a particular part of the county; but Lord Sandwich, who had opposed his son to him, opened a booth on the road by which they were to come in, under the colours of Sir Robert. Here he had placed several of his friends, who insisted upon the electors coming in and drinking success to their favourite candidate, a challenge which was willingly accepted. Here they were so well plied with wine and punch, with an infusion of laudanum, that they were soon put to rest; and the noble lord actually had them laid out on straw in piles by the side of the road, where they waked at last; but the booth had disappeared, with the host and all his merry companions.'

After an election at Norwich one of the electors happened to meet Mr Windham, who had contested the seat, and the man took the opportunity of stating in a very offensive manner why he had voted against him. 'Mr Windham replied very coolly, "You do this, sir, to put me off my guard, but I am collected; and though the laws of courtesy bid me knock you down, yet, as you have before voted for me, and as I think it will teach you how to behave in future, I shall only pull your nose"—which he did by *wringing it well*.'

The advertisements are not the least entertaining and interesting portion of these early issues of the *Times*, and they tell, among other things, how small was London as compared with what it is to-day. Houses are advertised for sale, and described as desirable residences only a mile or two from town, with so many acres of meadow-land, fruit-orchards, &c.; and we sigh as we remember that on that site now stands an insanitary slum, crowded with human beings, and without a fruit-tree within five miles of its dirty surroundings. Among the advertisements we, of course, find that of the plausible quack, who was as artful in baiting his hook as he is to-day. Witness the following: 'Those who wish to know that our great Creator is merciful as He is omnipotent, and that He never intended to torture mankind with disorders of extreme pain without putting it in their power to relieve themselves, are requested to attend at Copenhagen House on Monday next, at 2 o'clock, where a game of fives will be played by 10 men, all of whom have been cured by the Guestonian medicines after they had been returned from the London hospitals as being incurable. The attendance of any medical gentlemen belonging to these said hospitals will be esteemed a favour conferred on their most obedient servant, B. GUEST,' &c.

There are few references to art matters; but one there is of curious interest, reflecting as it does upon the *bonâ-fides* of the then president of the Royal Academy, Mr Benjamin West. There is a well-understood law that no picture which has been previously exhibited is to be sent in to the Academy. The president that year (1803) sent in a picture representing Hagar and Ishmael in the Wilderness, and one of the members of the council challenged its admission on the ground that it had been hung at a previous exhibition. The artist had written his name in the corner of the work, as is customary, with the date 1803, and on the faith of this inscription it was determined to hang the picture. But the doubting one examined that date more minutely, and discovered another beneath it imperfectly obliterated, showing the figures 1776. Here was a pretty kettle of fish! Back catalogues were consulted, and it became plain without the shadow of a doubt that 'Hagar and Ishmael' had made its public appearance at the Academy exhibition of twenty-seven years before. We read that 'the members of the council, indignant at the deception, regarded each other for some time in silent astonishment. At length it was resolved that the secretary should write to the president requesting him to withdraw the performance.' In the catalogue of the National Gallery of British Art, at South Kensington, appears the following entry among the pictures credited to Benjamin West, P.R.A. (*b.* 1738, *d.* 1820): 'Hagar and Ishmael. Signed (1776). Chalk. *Bought.*' This, presumably, is the picture above referred to.

What wonder is it that there is little mention of scientific matters or of inventions in these early pages of the *Times*? The steam-engine was as yet in its swaddling-clothes. Electricity was something of a magical nature which had no common interest, for it had not yet been applied to the service of man, although Galvani and Volta had made their names known. Most people were stay-at-homes, for means of travelling existed only to a very moderate extent: the railways had yet to come. Then, as now, such scientific advances as were made were wrongly described and grossly exaggerated. Let us take, for example, the following: 'Dr Galvani has discovered

a principle by which motion can be restored to dead bodies; and *Citizen Potel* of Paris has discovered a mode of employing *oxygenated muriatic acid gas* for the actual resuscitation of the dead. If thus death and disease are subject to the powers of human invention, what miracles are we not still to expect from the *age of wonders?*' We also read of 'M. Garnerin's flight into the aerial regions,' by which, of course, is meant a balloon ascent, and of the trial of an invention 'to enable persons to dive to a considerable depth, and fasten tackle to ships which may be sunk in order to hoist them.' Another reference to a flying-machine is evidently intended to be sarcastic: 'Mr Barrett, it is said, intends converting his balloon into a diving-machine, which has been suggested by its antipathy to mounting. The best Philosophers are of opinion it will dive with great alacrity, particularly if he attaches his cradle.' We are also informed that a Swedish captain 'has invented a machine for swimming and floating on the water without danger of drowning. As a reward for this discovery his SWEDISH MAJESTY has granted him a sum of 2000 rix-dollars.'

It is interesting to note that antiquarian research was not unknown at the beginning of the nineteenth century, for we read that 'the Pope has ordered a hundred galley-slaves to be employed in digging for antiquities in the old city of Ostia.'

But naturally the greater interest is found in paragraphs which refer to our own country. It is indeed difficult to realise the conditions of life when railways were unknown, and when before a journey by coach was contemplated, say, from Edinburgh to London, the prudent man made his will. For it was not alone accident by road that he risked. 'The different roads about town,' we are told in one entry, 'are much infested by Highwaymen. Thursday night a gentleman took a post-chaise from town to Edgware; and before he had proceeded more than four miles he was told by several persons that they had been robbed, and advised to return if he meant to avoid their fate.' There were no police; the streets were lighted with feeble lamps which went out if a high wind was blowing. Footpads lurked under the shadow of St Paul's. The jails were full, and executions for minor offences, as well as for murder, were terribly frequent; every man carried a cudgel to defend himself against possible assault; and, taking one thing with another, 'the good old times' were hardly so good as the present. We have lifted the curtain upon scenes which appear to us, in these days of orderly government, of rapid transit, rapid means of communication by telephone and telegraph, and general comforts of life, to belong to another planet rather than to our own. And we can only wonder whether, when another century has elapsed, our posterity will look back to the early days of the twentieth century with the same feelings of curiosity and amazement as those with which we regard the doings of the past.

IN CONDEMNED CELLS.

By EDWARD JOHN PRIOR.

HIDDEN away in remote recesses where people would never think of looking for them, and which are known only to the few, are bits of that old London which vividly recall the times commonly referred to with doubtful accuracy as 'the good old days.' I have recently come across some relics of this kind, and I think they are unique in interest. As far as I know there is no mention of them in any guide-book, and they obtain no honourable notice among the catalogued sights of the town. A friendly detective told me where they were. With a grin he assured me that I should enjoy myself there. Full of curiosity, I followed his directions, and after much wrestling with the topographical difficulties of London's byways, made the acquaintance of what are believed to be the oldest police-cells in London. The cells possess the distinction of being connected with the Tower of London by means of an underground passage. Anxious public authorities, well aware that this passage might encourage the curious to indulge in embarrassing adventures—for the very existence of such an entry to the historic Tower suggests all sorts of romantic possibilities—ordered a stout fence of wood to be placed across the entrance. This was several years ago, and the fence is still there. If, however, you are curious, as I was, you can obtain a glimpse of this dark and uncanny subway.

The locality is East London—hardly the place for the average sightseer, but alive with more real interest to the student of humanity and the man or woman thirsting for knowledge of life's realities than all the gilded thoroughfares of London or Paris. The neighbourhood is dull, seemingly unromantic, overcrowded with pitifully poor people of a dozen different nationalities, who fight the hard battle of life as best they can.

Any policeman east of London Bridge will tell you where to find Cable Street, E., for it is a thoroughfare which by some evil mischance has been associated at one time and another with a number of sensational crimes. Adjoining Cable Street and within a stone's-throw of the great London Docks are Wellclose Square and Neptune Street. The latter turns out of the square, and it is here, hidden behind bare walls, that the cells are situated. Without much difficulty you can obtain permission to see them by inquiring at a neighbouring hotel. Part of the hotel building consists of an original structure known as the Old Court-House, which includes the

cells, and in which justice of various degrees of merit was formerly administered.

The whole building was known as the High Court of Liberty. Certain local folk still refer to the place as the court-house; others, the 'sly house.' This latter description is a name handed down from long ago, and was applied in consequence of the fact that many people who went into the place were never seen alive again. In the building there was a court-room, a retiring-room for the judges, a jailer's apartment, and the cells of fearsome reputation.

The building is supposed to be about three hundred years old. It was in the latter days of the seventeenth century and in the earlier days of the eighteenth century that it played no unimportant part as a criminal court. Substantial portions of the court itself still remain. A dealer in furniture and curios carries on his business there now, using the bench on which the administrators of justice once sat as a convenient place upon which to deposit miscellaneous articles. The rail on the bench consists of hand-turned oak, and it is a noticeable fact that the woodwork of the building is of solid oak, tempered but unspoilt by age.

Our ancestors were very particular about their woodwork, and the unfortunate wretches whose lot it was to be cast into the cells at the rear of the court must have been keenly conscious of this. These cells are made of the most solid oak, and the walls and the doors are several inches in thickness. There was probably method in this thickness, for it hints significantly at the futility of trying to escape.

You approach the cells, which are some distance from the old court-room, with fear and trembling, through dark and devious ways. You are not quite sure of what is 'original' and what is modern around you; but, the darkness covering all, you presume it to be all 'original,' and in reality you are not far wrong. Now and again you stumble and perhaps bang a funny-bone somewhere, but you go on; the delicious sensation of the 'creepy' compels you to go on. The 'will o' the wisp' of a lantern may assist you as it dances fantastic capers ahead; shivering shadows pass you by; then you suddenly smell fresh air. You cross a small, a very small, yard—even the prisoners in the olden times were allowed this glimpse of free sky—and you commence the ascent of a narrow stone stairway. It is all dark, seemingly built for silent meditation on the difficulties of toiling upwards. Darkness and silence all round—all dark. You cannot forget the solid oak. It is unmistakably ominous. Thus you come to the door of Cell No. 1.

There is a sound like the report of a blunderbuss. You catch your breath, but there is no need for alarm. It is only the lock—a ponderous piece of mechanism about a foot in length. You wonder what it must have sounded like in the old days to the individuals who were sternly invited into the cell; but perhaps it was not so rusty then. The door is a wall of blackness, which falls back, disclosing a lofty apartment a little more spacious than the average suburban bathroom. You glance nervously around, and shiver when the grim cicerone with the lantern whispers that this is where 'they' used to find themselves. You do not envy 'they.' If the broad-arrowed unfortunates of the present day were afforded accommodation like this, the Prison Commissioners would have an anxious time in answering complaints.

There are two cells of equal size and identical design, if you can believe that such hovels were ever *designed* by any man in cold blood. The second cell opens out of the first. There is the same kind of massive big door—why big doors were used I cannot guess—and the same ponderous lock with the explosive-cracker voice. Each cell is lighted—very dimly—by a separate iron grating, to which sliding shutters are attached. The gratings are so high that the prisoners could not have the doubtful pleasure of looking through them. They could only look *at* them, and perhaps—who knows?—lull themselves to sleep by monotonously counting the iron bars which form the lattice. The shutters were instruments of torture or of punishment; it all depends on the point of view. They can be easily closed—with a bang; everything seems controlled by this ominous bang. When they are closed it is dark—how dark I cannot adequately explain. The darkness is quite Egyptian in its quality. It is an all-embracing, hopeless, suffocating blackness, of a solidity which seems to warrant the attentions of an axe if the fair light of this world is ever to be seen again.

Overhead, in apartments only a few degrees more comfortable, the jailers lived. You can dimly imagine the type of warder in such a place. He would be a burly, square-jawed, sallow man, with deep-set eyes and an ugly leer, carrying keys each as big as nine-pins. Some perhaps were men of humane disposition; one hopes so. The warders who controlled these shutters used them to pacify the troubled wretches below, or to goad them into a madness which may have been thought desirable.

At one end of the cells there are broad wooden ledges which served the inmates as beds. You test the resisting-power of these 'beds' with the toe of your boot, and form a hasty conclusion that the much-maligned plank-bedstead of many casual wards is a tremendous luxury by comparison. Certainly no dweller in Dartmoor would ever dream of recognising these structures as beds. The only thing which can be said in their favour is that they were not intended to be used by the same man for very long, for the inmates of these cells were mostly those who were marched off for execution on Tower Hill, which is conveniently near at hand.

After the bone-racking beds you view the ferocious iron clamps made to embrace the ankle or the arm or even the neck, and the more ordinary leg-irons with chains which are fastened to the wooden walls. There is a strait-jacket too—an uncomfortable garment, which, one fears, sadly lacks the qualities

insisted on by medical science in our asylums to-day.

You view these things and shudder; then you see the things which make you smile. The things of real human interest in these cells come before your eyes. By the light from the grating you appreciate that the strange men, most of them absolutely unknown, whose hard fate it was to be confined in these cells had a varying sense of humour, of sublime indifference to surroundings, or a fixity of mental purpose which you cannot but admire. The diabolically thoughtful people who designed the cells with the wooden beds and the iron grating had no scheme of decorations which they felt under the necessity of carrying out. The prisoners, who came later, valiantly sought to supply the deficiency: on the hard walls of wood they carved various designs, initials, names, and sundry dates. One can faintly picture the figure of some lonely rascal or much-wronged man under the shadow of death carving industriously with knife-blade to kill the dreary hours of torture between night and night.

Edward Burk, a notorious criminal in his day, carved his name on the walls. Edward Ray, who was taken away and hanged in the middle of the eighteenth century, is another name to be found there. Dick Turpin, the famous highwayman, is believed to have paid a visit to the cells, but he left no record on the walls as far as can be discovered. One William Thompson, who found his way into the cells, carved a really fine acorn on the wall, perhaps in appreciation of the toughness of the oak. He must have been proud of his work, for he took the trouble to endorse it 'By William Thompson.'

Some unknown prisoner, seeking to set an example, attempted an ambitious representation of the Tower of London. This man believed in a large canvas; but his design, though striking, is quite unconvincing. Much more success, however, attended the efforts of a man who carved a regulation-sized chess-board on the floor of his cell; the feet of the curious have helped to obliterate the pattern, but the white and black squares can still be plainly distinguished. Surely there is something pathetic in the thought of this man, a probable lover of chess, spending his awful solitude in perpetrating a design to remind him of his beloved game.

Various words and half-words speak significantly of interrupted labour or of the sudden lassitude which springs from only a half-hearted appreciation of artistic work (even with a knife on tough oak). But if you are at all impressionable you will value these fragments. When you think of what the men who attempted them may have been suffering in mind if not in body (the leg-irons are in suggestive proximity to some of the designs), the crude attempts are invested with an undeniable interest—wooden human documents!

The man who persevered sufficiently to write four lines of doggerel on the hard wall of his condemned cell must have smiled grimly. The writing, which is fairly clear, says:

> The cup is empty,
> To our sorrow;
> But hope it will
> Be filled to-morrow.

You wonder how many horse-stealers, assassins, and treasonmongers read this verse and echoed its sentiment before they commenced their gloomy march through the long, dark, silent passage.

The cells bear every evidence of having been well used. They are undeniably brutal places which were built to deal in a brutal way with crimes sometimes serious, often trifling. As objects of interest, one likes to inspect them; but as you go away there is a strong feeling of loathing in you. You are glad you do not live in an age when youths and men, after being confined in such places as these, were hanged for petty thefts.

The cell-door bangs behind you. You go down the narrow stairway, past the entrance to the underground passage, and through the same puzzling ways into the comparatively fresh air of East London.

You look behind at the curious collection of buildings which was once a court-house and prison, and feel just a little bit inclined to congratulate yourself that you have made a safe escape.

ANTICIPATION.

In that new earth where Faith is merged in sight,
And mortal mists have passed beyond the range,
Where Hope is clothed in everlasting light,
How shall we bear the bliss of that great change
When we reach home!

Those visions seen of old by holiest men,
Those Eden-dreams of earth's unsullied youth,
We too shall see, and shall not lose again,
Dreams now no more, but God's eternal truth,
When we reach home.

Our world is lovely: earth and sunny skies,
The play of light upon the sea and shore;
But yet beyond earth's utmost gate there lies
A splendour never man has seen before,
When we reach home.

When darkening doubts that blurred the light of day,
And stood between us and that fair, far land,
Shall disappear, and on our onward way
Leave nothing that we may not understand
When we reach home.

When friend meets friend once more, round that new hearth,
After long years of waiting, night and day,
When we have laid aside these bonds of earth,
There will be much for loving hearts to say
When we reach home.

For all in this sad earth that gave us pain
Shall fall away when we have crossed the river,
And all that's best shall still with us remain,
And all that's wrong be blotted out for ever,
When we reach home.

To be at rest: earth's sin and sorrow gone,
To hear at last the angelic host outpour
The mighty anthem, heard in heaven alone,
Of love that death can sunder nevermore,
When we reach home.

INDUSTRIAL ACCIDENTS.

By HARRY J. WILSON.

DURING the year 1903 four thousand one hundred and fifty-three workpeople were reported as 'killed in the United Kingdom by accidents that occurred in the course of their employment.' This is the bare official announcement; but it is somewhat surprising to learn that in the peaceful pursuits of industry such a number of fatalities should have occurred, a death-roll which even in an important campaign would strike one with dismay.

Shipping accounts for more than one-fourth of the total, mines and quarries claim about an equal proportion, and the remainder is shared between factories, docks, and the railway service.

Were all the casualties to occur simultaneously, or to be spread over a single week, the country would be thrown into consternation; but, as it happens, industrial accidents usually affect only one individual at a time, they are well distributed over the land (though certain important centres naturally claim more than agricultural areas), and almost every calling contributes its quota. Broadly speaking, each industry has its own particular type of accident, and this type varies as the processes, machinery, or tools employed are of a dangerous character or not. There is much greater probability that a railway-shunter or coal-miner, for instance, will in the course of his working period of life sustain some injury to his person than that the cabinetmaker or tailor will be mutilated. In most cases the remuneration is commensurate with the risk run, but this does not always follow.

The great industries of the country fall naturally into certain groups, and it may be advantageous to discuss first one of the most important—namely, mining.

In coal and metalliferous mines there were employed in 1903, above and below ground, almost a million of people, and during the year no less than one thousand and ninety-seven males lost their lives in this highly necessary calling. The underground worker runs vastly more risks than his mate on the surface in both coal and metalliferous mines, the deaths among the former being approximately eight times that of the latter. As in shipbuilding, so in mining, by far the largest proportion of serious and fatal accidents is occasioned by falls; but in this case falls of the roof and sides of the working. This is a risk to which the miner is constantly subjected; and although in these days catastrophes by explosion are happily rare, yet the number of men killed by falls of rocks and earth continues very heavy, in spite of elaborate precautions and careful timbering and propping of the roof. Where workmen have their safety largely in their own hands, it appears to be true of all trades that they will deliberately incur quite unnecessary risks in order to save themselves a very little trouble, and this is especially true of mining. Next in importance after falls follow accidents due to the movement of vehicles underground, such as trams and tubs, or to haulage-gear.

The quarryman's occupation, on the average, is almost as dangerous as the coal-miner's; he is liable to serious mutilation from blasting, and is frequently maimed by falls of earth or rock from the sides of the quarry or from the face of the working. Moreover, his hours of labour are longer than the miner's; but he escapes the disadvantage of having to walk underground perhaps miles in a cramped position to or from his work. He is invariably in the open air, and, though frequently prevented from following his calling by inclement weather, has not to endure the dirt and discomfort of the mine, nor is he prevented from indulging in a pipe when so disposed.

The great textile industries of our country, which, according to recent statistics, employ over a million men and women, the latter predominating, are chiefly located in Lancashire, Yorkshire, North Ireland, and Forfarshire. They include the manufacture of cotton articles, woollen and worsted goods, silk, flax, and jute fabrics, lace, shoddy, and the spinning and weaving of horsehair. The workers in each class are liable to accidents peculiar

[*All Rights Reserved.*]

to the industry, due chiefly to the particular construction or design of the machines in use. With rapid-running looms, for instance, the shuttle occasionally flies—that is, leaves its accustomed path and shoots several yards from the machine. At times the attendant is struck about the body, when perhaps little harm is done, the corsets worn by the weavers protecting them; but if the shuttle rises, and the weaver happens to be stooping at the moment, a severe wound may be inflicted about the head or face. Many weavers have lost an eye in this way, and others have had their teeth knocked out. In the weaving of wide fabrics the loom runs slowly; the shuttle, however, is very heavy, and when it does fly, the attendant, if struck about the temple, may be felled senseless to the ground. These shuttle accidents are now happily becoming more rare, for it has been found that a simple protection attached to the loom prevents the shuttle from rising and doing damage. In the spinning and preparatory processes, lacerations of the fingers due to revolving pinion-wheels are common in all the textile industries; but children and young persons suffer, in proportion to their number, more than adults, owing of course to their inexperience and natural indiscretion. Accidents of this character, largely preventable, are being materially reduced in consequence of the general improvement in the protection and safeguarding of machinery. A careful examination of new textile machines, particularly those employed in cotton manufacture, will give one the impression that an accident is almost impossible, so beautifully is all the intricate mechanism covered over by cages and highly polished iron shields. The safeguarding of machinery and appliances is insisted on by statutory provision in manufacturing premises falling within the scope of the all-embracing Factory Act. This elaborate and intricate measure, the outcome of a century's labour-legislation, affects almost every conceivable trade in the United Kingdom, ranging in its scope and application from millinery workrooms to ordnance factories, and controls the humblest cobbler as well as the builder of battleships.

Workers in wood—joiners, mill-sawyers, cabinet-makers, and others—are largely immune from the graver forms of accident; but those attending circular-saws or planing-machines suffer greatly from mutilated fingers. The circular-saw, most useful of tools, plays sad havoc with the unwary hand thrust too near it, and has a nasty habit of pitching fragments of wood towards the operative with terrific force. The writer has known many fatal accidents due to this peculiarity. One in particular may be instanced where a piece of mahogany, accidentally brought into contact with the rapidly running teeth, was projected nearly thirty yards, smashing through a massive door and killing instantly an unfortunate man who stood in its path.

The knives of the wood-planing machine claim many victims, since a momentary slip of the hand in dressing narrow material may mean the loss of several fingers. The damage is done in an instant, and the unfortunate worker thus maimed is in the position of a trader who loses the bulk of his capital, for the artisan without his fingers must submit to a serious reduction in his earnings, and no money compensation can quite recompense him for the loss of a limb.

Shipbuilding must be reckoned amongst our most hazardous industries. True, as an accident-producing trade it falls behind certain railway occupations, such as shunting or plate-laying, and coal and iron mining; but it takes precedence of all others, with the exception perhaps of dock-labouring and metal-extraction. The great bulk of shipbuilding accidents are due to falls—falls of the workman from his staging outside or inside the ship, or of articles dropping upon him from above. It must be remembered that during the construction of a vessel gangs of men are constantly at work on staging running round the outside of the ship at various heights up to forty or fifty feet from the ground, and simultaneously others are busy inside the vessel, standing often on narrow planking at giddy heights above the bottom of the hold, or, as it is called technically, the tank-top. The steel plating forming the inner bottom of the ship makes with the outside shell the cellular space known as the tank, and is filled with water for ballast in merchant-ships. A momentary slip in descending a hold-ladder, a false step while on a staging or walking near an unprotected hatchway, and down the victim falls crash to the cruelly hard steel plates below. Usually the skull is fractured and the bones of some of the limbs broken as well. Extraordinary escapes are recorded, such as a fall being rendered almost harmless owing to the victim plunging head-foremost into a heap of snow or falling on a coil of rope which acted as a cushion. Boys, too, frequently suffer less from a serious fall than adults, their lighter bodies and more elastic bones proving of benefit under such circumstances. One lad of fifteen twice fell from a gangway nearly forty feet high—on soft ground, however—but escaped with minor injuries, and was appropriately named the 'india-rubber boy' afterwards by his comrades. Falls from staging outside the vessel, although too often fatal, yet are slightly less serious, the softness of the ground reducing the force of impact.

Riveters are not only particularly liable to eye-injuries from hot scale or splinters flying from the hot rivet while it is being hammered up, but they are also exposed to injury of another character, humorous were it not so painful. Before a rivet is placed in position, a tapered peg of steel known as a 'drift' is driven through the punched holes to bring them exactly in line; occasionally the operator will insert his finger to feel if the holes correspond, and the workman in the inside, mistaking the dirty finger thrust through for the drift, strikes it a smart blow with his hammer. It is well, perhaps, that stout steel plates separate the individuals under

such circumstances, otherwise the event would not terminate in uncomplimentary language only. At times a member of the black squad is unfortunate enough to receive a red-hot rivet inside his open shirt-collar; but there is a suspicion that the heater-boys are not guiltless of repaying a grudge by this method. The opportunity presents itself if the heater is at work on a stage immediately above his intended victim. Shipwrights, a class now decreasing owing to the superseding of wood by steel in ship-construction, rarely work more than a year or so without receiving the characteristic trade-mark of the craft, and it is invariably self-inflicted. A tool known as the adze is responsible for this type of accident. The operator in using the appliance, which may be described as an axe with the cutting edge at right angles to the shaft, always directs the stroke towards himself, usually towards his feet, and in the event of any object catching his arm, the blow may fall on the shin-bone or his toes, inflicting a serious gash which leaves its mark for life.

The dock-labourer's duties are popularly considered dangerous, and indeed they are, judging by the high percentage of fatal and serious accidents among this class. Dock-work may be classified essentially as unskilled labour. The ranks are mainly recruited from men who can secure nothing better; but a certain number find fairly regular employment in our large seaports, where they make the loading and discharging of steamers and small craft their profession. Falls are here again responsible for most of the accidents. When discharging general cargo the men in the hold are always liable to be struck by bales or packages which drop from slings when being hoisted out, while those on the deck or quay may be knocked into the docks or back into the ship's hold by articles swinging from the crane-jib. Loading and discharging is too often carried out with feverish haste, for woe betide the stevedore who causes the ship to miss a tide! At night, of course, with artificial lighting, the dangers are materially increased. The men who load coal from overhead staiths or hoist it on board from barges run risks of an analogous kind, and have many an involuntary cold plunge in the grimy water of our river estuaries or docks. Only a small proportion, however, lose their lives by drowning as compared with seamen who, attempting to gain access to their ship from the quay in the darkness, frequently fall between the vessel's side and the wall, making their rescue a difficult matter. The seaman, unfortunately, during his brief sojourn in port, has a marked partiality for strong drink and the convivial society of such licensed premises as always abound in the vicinity of docks for the convenience of mariners. Difficult as it is for one in command of all his faculties to board a craft at night by means of a horizontal ladder stretched from quay to ship's rail, it is small wonder that the muddled sailor, his eyes unaccustomed to the gloom after the brilliant light of the drinking-bar, not seldom misses his footing and drops into the water below. Where no helping hand is near, a man in circumstances like these has a fierce battle for his life. He may find himself wedged between the ship's hull and the quay, and have no means of climbing out; or, worse still, strike his head under the ship's bottom when rising after his first plunge. Even if he dives under the ship and swims back to the quay, he is still in difficulty if no convenient ladder is attached to the stonework by which to climb out. At the present time the State is arranging for the establishment of a series of regulations applicable to all docks and harbours, which, if strictly carried out, should save many a life and prevent unnecessary accidents. Adequate lighting, the protection of dangerous corners on quay walls, and the provision of life-belts at numerous points are only some of the recommendations.

The iron trades are responsible for a large proportion of the total industrial casualties; but the operations in certain branches are vastly more hazardous than in others. Persons engaged in small work—gunsmiths, bolt and nut makers, or wire-drawers—are exposed to only minor risks; but when a blast-furnaceman enters an infirmary it is usually for something more grave than a mere contusion. All workers in hot iron are exposed to those most painful of injuries, deep burns, and the damage done by molten metal is pitiful. While the liquid white-hot iron is being run into pigs at the furnaces the metal occasionally 'boils' and spurts over the person of any one unfortunately near, or a somewhat careless man may bring a fiery shower upon himself by introducing a damp tool into the running metal. The instantaneous generation of steam in such cases will scatter the material about, and the operator is fortunate if he escapes without some injury to his eyes or face.

In the heavier iron trades additional dangers are created by the network of railway lines which extends on all sides of the working premises. Here small locomotives ceaselessly fly about, with shrill whistles, dragging ladles of molten slag or pushing bogies bearing hot ingots; and it requires a steady head and quick eye to effectually evade them all on a dark or stormy night. Accidents due to these locomotives or the vehicles which they draw are usually serious and very frequently fatal. Their prevention is difficult, as footpaths cross and re-cross the rails, and the average workman, although provided with a subway or bridge for his safety, will still prefer to take the nearest route to or from his work, and incur the risks.

In tin-stamping—that is, stamping out lids and bottoms of canisters—the tips of the attendants' fingers are very apt to be nipped off by the descending punch; and a similar mishap is frequent at brick-presses, the plunger in its downward path catching the unwary hand.

For a boilermaker, hammerman, or man engaged in rolling steel to lose the sight of an eye through

flying splinters, scale, or hot metal is by no means uncommon; indeed, in the iron trades eye-injuries are distressingly numerous.

Persons working at paper and cloth calenders suffer largely from nips, the fingers being drawn between the rollers: a class of accident not unknown also in laundries, where the heat of the rollers not only adds to the pain, but, by searing the flesh, makes the healing process a tardy one.

Although the industrial death-roll is still very heavy, it is comforting to know that a wise legislature has provided a large staff of officials whose sole time is occupied in administering the statutes directly intended to safeguard the lives, limbs, and general health of the working population. One hundred and fifty-one inspectors supervise the great army of factory and workshop operatives, the welfare of miners and quarrymen has the unremitting attention of thirty-eight mine-inspectors, and the interests of seamen and railway workers are safeguarded by officers of the Board of Trade.

GIANT CIRCUMSTANCE.

CHAPTER VIII.—BELOW THE BELT.

WITH the assistance of a couple of his men, Geoff carried his friend into the square, the components of which showed very visible signs of wear and tear. The ground was thick with wounded, and the doctors were busy. As they bore the limp body along, Challis scanning its injuries searchingly, they ran up suddenly against Colonel Everett, whose face also showed what he had been coming through.

'Challis! What the—what are you doing here, sir? Where is your convoy?'

'All safe, sir. We came to help.'

'Came to help, sir? Came to help?' foamed the colonel. 'By ——, sir! I'll teach you to obey orders. Get back at once to your command, sir. I'll deal with you later;' and he hurried on his way, to see the damages with his own eyes and to start the square for the wells.

Challis handed his friend over to the doctors; heard briefly from them that casualties were very heavy, which he could see with his own eyes; that General Burleson was dead, shot through the head at the beginning of the fight; and that Colonel Everett was therefore in command. Then he hurried back to his convoy, calling to such of his men as he could see to follow. And as he went, in spite of himself there was that wild inclination to laughter in his heart which had been there that other day when he found himself riding between deaths—from the death behind to the death in front. God! life seemed impossible. Men had been broken before now for doing what he had done, and yet he had no regrets, for he could no more have stood quietly in the safety of his zariba, with the rear of the square crumbling to pieces under his eyes, than he could have turned tail and run before the enemy.

The colonel was in a breaking humour, however, and there was no doubt that he had got his opportunity if he chose to drive it home. And of that Challis had small doubt. He had disobeyed orders in the most flagrant fashion, and he had saved the square—deadly sins in the colonel's eyes beyond all question. Well, well! Life truly was a puzzle beyond any man's solving. So he gave orders to unbind the camels and prepare for a move, lit his pipe, and sat on a dead beast and waited developments. The square moved on to the wells, and presently Burleson's aide, young Levin, accompanied by a couple of sergeants, came stalking across to the convoy.

'Convoy to move up to the water,' he announced. 'And Challis, my boy, I'm to take your sword. What the deuce is the meaning of it? What's got up the old man's back now? He's shaping for a fit, from the looks of him. Has he got a touch of the sun, do you think?'

Challis smiled grimly and shook his head. 'Mustn't try and pump the prisoner. Anything he says will be taken down and may be used in evidence against him.'

'Well, I'm blessed if I understand it! No'—as Challis made to unbuckle his sword—'keep it till we get there, anyhow. Maybe he'll take another turn and think better of it.' And the tumultuous crowd set itself in motion towards the wells, Levin giving him some of the prominent details of the casualty list as they went.

Losses had been heavy on both sides. The stretcher-bearers were busy at work, and the surgeons and their assistants busier still. Burial-parties were already laying out their grim burdens in long lines ready for immediate interment—white men on one side, blacks on the other.

'Well, where's quad?' asked Challis grimly when they reached the vast confusion of the wells.

'Hanged if I know. I suppose I'll have to take your sword after all, as he's not sent any word back,' said Levin reluctantly. 'Suppose we make it open arrest, and then you'll be free of the camp. Just keep out of the old man's sight, though, or he'll be down on me too.'

'Thanks, Levin. Then I'll go and help to tie up some of the broken ones.'

Levin left him to his own devices, and he went off in search of Cameron. He found him at last, lying in a scrap of shade under a palm-tree, bandaged up but unconscious and barely breathing.

'He may go any minute,' said one of the surgeons, stopping his hurried course for a second and bending

over the quiet body. 'Two bullets through him, and his skull bashed in. It was hot work while it lasted;' and he sped away to checkmate the destroyer with some more hopeful case.

Challis sat down by his friend. He took the hand, that was chilling in spite of the heat, in his own hot one, and waited. It was sad to see him die there on the sand. Challis would have felt it sadder still if he had died there all alone. It was but a very few minutes when the cold hand moved gently in his own and then lay still. Geoff covered his friend's face to keep off the flies, and went to help with the others.

Late in the afternoon, Colonel Everett, having reduced chaos into something like order, was sitting in his temporary quarters when his friend Major Bax came hastily in to him. They were old school and college mates, and, though punctiliously ceremonious in public, kept up no pretences in private. Bax, at all events, did not.

'What's all this about Challis being under arrest, Everett?' burst out the major. 'Have you gone jumping crazy?'

'When I want your advice, Bax, I'll ask for it,' said the colonel grumpily.

'I'm hanged if you will! If you wait half that long it'll be too late. I hate to see a man digging pits for himself—that is, when he's a friend. You're making a mistake, my boy, and the sooner you mend it the better. Is that whisky? Thanks! Now, let's talk sensibly. What's your charge?'

'Disobedience to orders.'

'As how, for instance?'

'I appointed him to the convoy. Next thing I know he's in the square and the convoy is looking after itself. By deserting his post he imperilled the success of the whole expedition.'

'Do you happen to know where the remains of the expedition would be if he hadn't, as you call it, deserted his post? I'll tell you. You were in the front of the square. I was in the rear. And let me tell you that it's downright silly business to put cavalry-men on foot into a square. Never you do it again. In the first place, a cavalry-man is never handy on his feet; and, in the second place, he's been brought up from his cradle to believe that squares were made to be broken, and can and must be broken. So he's got nothing to stand on, so to speak. See? Then he's used to a carbine, and a Martini-Henry with a bayonet is a deuce of a handful to him. Things were very serious in the rear. The ranks were broken, we were dented in, the blacks were in among us, and the cavalry-men were poking one another's eyes out with their bayonets. They did their best; but they were fighting wild, and the blacks were waltzing round them and enjoying themselves immensely. You'll find that two-thirds of the casualties were in the rear. In another two minutes the square would have been turned inside out. Challis must have seen it from the convoy. He'd beaten off his own attack, I'm told. So he nipped over with his men and came down on the rear of the blacks just at the right moment and not a second to spare. If you find fault with that, Everett, you're more of a fool than I've ever thought you. And, by Gad, sir! the thing is known, and you'll have only yourself to thank if all the world whistles at you. I know you bear him a grudge over that last affair. If you'd taken my advice then'——

'What you have told me, of course, alters the case,' said the colonel sourly. 'He's been talking to you, I suppose.'

'I met him helping with the wounded and looking as grim as a death's-head. I asked him what was up, and he told me he was under arrest. I asked him why, and he said he had not yet been informed. That was the extent of our conversation.'

'Very well,' said the colonel. 'On the strength of what you've told me I'll countermand the order.'

'It'd have been a sight more sensible never to have given it.'

'I am the best judge of that. Levin is provost-marshal. Oblige me by asking him to step this way;' and Major Bax took another pull at the whisky, annexed one of the colonel's private cigars, and went on his way quite pleased with himself.

And so, in due course, young Levin came sauntering along to where Challis was still busy doing what he could for the comfort of the broken men, and whispered gaily into his ear that the old man had taken another turn and come to his senses again, and he was released from arrest.

'Quite so!' said Geoff grimly. 'You can return my compliments to Colonel Everett, and say that I request an inquiry into the matter. He has chosen to publicly place me under arrest. Now he's got to justify his action.'

'Oh, come, Challis! you know you can't insist on that. It's contrary to regulations.'

'Not more than his placing me under arrest was contrary to justice, my child. I'm getting a bit tired of playing worm to Everett. It's time it stopped. I must return to duty, of course; but I shall certainly not let the matter rest here. I believe I have the right to apply to the Commander-in-Chief. Isn't that so?'

'Yes, I suppose that's so. But—well—I don't think I would if I were you.'

'If you were me you'd probably do what I would do and intend to do, my boy, and you can go and tell Colonel Everett all about it.'

Leven chewed the matter over as he returned to headquarters, and finally decided to tell Colonel Everett just enough of what had passed to show him how the wind blew. Then it would rest with the colonel to do whatever his common-sense dictated. After a stormy five minutes with himself, Colonel Everett's common-sense dictated a short and extremely civil note, which by no means expressed the writer's real feelings, and which Challis read with a brief smile, and stowed away carefully in his pocket.

Thereafter relationships were strained to the utmost between them, which was perhaps only natural. Lieutenant Challis's name was never mentioned in the despatches. The correspondents' telegrams were severely censored, and it was not till weeks afterwards, when the public at home could not have told you for certain and without consideration whether Tembé was in South America or in Spain, that broken scraps of the details of the little fight up the Nile leaked out. Even then references were guarded, and Geoffrey Challis's only reward for saving the column at Tembé was the indignity of half a day's arrest and the consciousness of having done his duty.

Tembé, connected with the base by long wavering lines of camels and a bristling track of camels' bones, became a centre for further active operations against the discomfited enemy. In all these, but especially in the arduous work of keeping the communications, Challis bore his part silently, strenuously, and with never one single word of commendation from his chief.

He got very sick of it all. Now that Cameron was gone, the social atmosphere was distinctly uncongenial. The members of an autocracy inevitably take their cue from the head of the state. Their whole well-being is dependent on his favour. He smiles upon them, and their spirits and fortunes are in the sun. He frowns, and they are in the shade. To openly espouse the cause, or even to accept the friendship, of the man against whom the autocratic face is shut is to court equal shadow. Unless the friendship is a vital matter it is apt to shrivel under such circumstances, and Challis found himself a lonely shade.

He toiled incessantly. He made hard work his chosen friend and companion—that good friend who has saved many a sick soul alive. Others went stale and were invalided home; but nothing seemed to hurt him, and he never seemed weary, which was a good thing for all of them.

But time came at last when all had been done that could be done. The troops shook off the dust of their feet against Tembé and marched away to the north. The last convoy straggled away along the well-defined path between the desiccated bones, and the wells and palm-trees were left to their natural solitude and the chance visits of trading caravans. The withdrawal was child's-play after the hard labour of the advance; and when his chosen friend and companion failed him, Challis lapsed into low spirits and a taciturnity which was rarely broken. His future was in the hands of a man whom he had never wittingly offended, but who had twice done his best to ruin him—and failed, and who therefore detested him.

He might, of course, wait till Colonel Everett betook himself elsewhere. Or he could exchange. But, he said to himself, the same conditions might equally prevail elsewhere, and no man's future was secure where it depended on another, as it mostly did in every department of life. He got a bit sick of life itself.

Before he reached England he had quite made up his mind to send in his papers and have done with it. It might possibly be somewhat of a pill for Uncle Carrick; but when he understood the whole of the facts Challis doubted if he would find fault with him.

He would try the diplomatic service probably. He had brains and energy, and all the diplomats he had ever met had struck him as essentially broad-minded; a bit autocratic perhaps, but not in any small, mean way, and too much given to the handling of weighty affairs to have time for the secretion and indulgence of petty venom.

(To be continued.)

AUTHOR AND PUBLISHER.

MR EDWARD MARSTON, of the firm of Sampson Low, Marston, & Company, who has been connected with bookselling and publishing for sixty-five years, fifty-eight of which have been spent in London, has written an interesting volume of recollections, entitled *After Work: Fragments from the Workshop of an Old Publisher* (Heinemann). As he has had dealings with between eight to ten thousand authors during his publishing experience, he has a story to tell which all who are interested in some of the best literature of the past half-century will be glad to listen to. Publishing he regards as one of the most interesting of all commercial occupations, when books sell and the balance comes out on the right side. He has had experience of losses and gains, and yet has not been soured or unduly uplifted. Mr Marston's dealings with authors seem to have been of the most agreeable kind, judging from the examples given. Lieutenant-General Sir W. F. Butler, like W. Clark Russell, stood in awe of him at first, and shadowed Mr Marston in Fleet Street ere he came to close quarters, believing that a producer of books must be a very high, solemn, and sacred personage. Sir H. M. Stanley, when the bargain, satisfactory to both parties, was struck at Paris for the publication of *Through the Dark Continent*, said to Marston, 'I speak to you as my friend, and not as my publisher, and I tell you that if —— [meaning another publisher] were to offer ten thousand pounds down I would not leave you.' And he did not; the connection was highly honourable and mutually advantageous to the end. This was equally the case in the association with R. D. Blackmore, whose *Lorna Doone* and other novels passed through

his hands; also with Harriet Beecher Stowe, Louisa Alcott, Oliver Wendell Holmes, W. Clark Russell, William Black, Jules Verne, and a host of others. Mr Marston might have spared a line or two for Josiah Gilbert Holland, whose *Timothy Titcomb's Letters*, *Kathrina*, and *Mistress of the Manse* appeared in Low's list. Mr Marston is known as the author of many delightful fishing-books by 'The Amateur Angler.' He is no amateur writer or publisher, however, and his recollections are worthy of a place beside the biographical records of the publishing houses of Murray, Macmillan, Chambers, Blackwood, Black, and Knight. The book should be an inspiration to all intending booksellers and publishers. A. K. H. B., who had not a little experience with publishers, authors, and editors, gave it as his opinion that 'a publisher makes the best editor. He is much less likely than a man of letters to fill a periodical with unreadable papers which echo his own crotchets. He is much more accurate. He is absolutely without jealousy. He knows nothing but the success of his magazine or review.' Mr Marston seems to have been an able and fair-minded publisher of this kind.

As an octogenarian who has passed into the twentieth century, the author has evidently no admiration for the American method lately introduced of selling books by means of bold, big, unscrupulous advertising, a method which puts money in the pocket of the advertiser but very little into that of the bookseller. The middleman, too, in the shape of the literary agent, has made the author less of a friend; the agent sells the author's wares to the highest bidder, and forces up the price by competition. He may be powerless with a new author; but when a writer has made a name it is not difficult to wring the guineas from a willing publisher. Mr Marston is no pessimist, and believes there is a great future for the higher class of literature and for the publishers of good books. Already the sales of certain books are beyond anything ever seen in the trade.

Edward Marston, who was born in Shropshire in 1835, spent the first fifteen years of his life on a farm, to which he attributes much of his after-health and longevity. Between 1840 and 1844, he tells us, he was an idle apprentice to a bookseller. The pretty girl with whom he then fell in love became Mrs Marston in 1851, after seven years of waiting. He came from the Liverpool newspaper business of Willmer & Smith straight to Sampson Low's in London. His new master, who was born in 1797, and died in 1886, bore one of the most highly esteemed names in bookselling and publishing, and he did much philanthropic work outside his profession. In 1836 he was appointed by a committee of leading London publishers to establish and conduct the well-known *Publishers' Circular*, which afterwards became his property. Marston was more or less connected with it for fifty-eight years, called on publishers, and spent hours in Stationers' Hall securing titles which had escaped notice. No book is better known to the trade and to literary folks than Low's invaluable *English Catalogue of Books*, which from 1835 until 1900 has recorded the titles of nearly four hundred and twenty-five thousand five hundred books. This has been an enduring service to the literary history of the nineteenth century, and of great value to the trade and all engaged in the business of literature. Low was also secretary of an association for putting down underselling. Lamb's Conduit Street was his first place of business.

It was in 1856 that Marston became a partner in the Sampson Low firm, which in 1849 had been established in Fleet Street, and in 1852 at 47 Ludgate Hill. For a few years Marston was away, and had started an export agency for shipping books to Australia and elsewhere. This colonial connection he took back with him on his return to Low's, and in the course of a busy life he believes that he must have written twenty thousand letters to foreign correspondents, one day a month being set apart for this purpose. Sir E. B. Lytton is the first author that flits across Mr Marston's pages. He is described as tall and slim, with a slight stoop; a high forehead, somewhat receding; shaggy eyebrows, and aquiline nose. He appealed to Low to assist in protecting him against Galignani of Paris, who was reprinting *My Novel* from *Blackwood's Magazine* without permission. Then the firm arranged to publish *A Strange Story*, the bargain being for fifteen hundred pounds. There was some competition for the succeeding book to Harriet Beecher Stowe's *Uncle Tom's Cabin*, that famous book which had been offered to and refused by Messrs Groombridge, and of which H. Vizetelly had an edition, as well as S. O. Beeton. Mr Low, junior, when returning from Mrs Stowe's residence at Hartford, after arranging for *Dred*, met S. O. Beeton coming up! He was less than a day late. All the English editions of Mrs Stowe's works came to the firm. The blind chaplain to the American Senate, Rev. W. H. Milburn, must have been an interesting man to meet. He was spare, with dark hair and a broad and thoughtful brow, and, like most blind men, was always cheerful. His *Rifle, Axe, and Saddle-bags* is a striking and entertaining book. Then George Catlin (author of *Life amongst the Indians*) and Miss Cummings (author of *The Lamplighter*) became clients of the firm, which won a lawsuit with Routledge over the English edition of *Haunted Hearts*. From the *Autocrat of the Breakfast Table* (1858) to *My Hundred Days in Europe* (1886), a considerable list of works by Oliver Wendell Holmes appeared in English editions. When Holmes called, on his last visit to Europe, he was as brisk and lively as a young man, and said he was delighted to grip the hand of Marston, a man with whose name he had been familiar for thirty years.

A tribute is paid to Joseph Whitaker, the son of a London silversmith (born in 1820, died in 1895), who founded the *Bookseller* in 1858 and *Whitaker's Almanack* in 1868, a book that has grown in use-

fulness and popularity ever since. Marston and Whitaker aided in the booksellers' contribution to the Paris relief fund of 1890. There is another tribute to Charles Edward Mudie, founder of Mudie's Library, who started with a small circulating library in Upper King Street, Southampton Row, at the age of twenty-two. He was of slender build, with a broad and thoughtful brow, and was an earnest thinker, endowed with much magnetic influence. There is an interesting reference to John Francis of the *Athenæum*, who did so much for the repeal of the advertisement duty, the abolition of the compulsory-stamp, and the repeal of the paper duty. Wilkie Collins's *Woman in White* (1860) had been so successful that when Low published his *No Name* the bargain was for three thousand pounds, and the firm did not lose by it. Charles Reade, according to Mr Marston, was an excellent man of business, and drove a hard bargain for *Hard Cash* (1863). He is described as tall and stout, of a fine florid complexion, with large, wide-open eyes and husky voice. Mrs Gaskell was another of the firm's novelists; and in 1864 James Payn treated for the publication of *Lost Sir Massingberd*, which had run a successful course in *Chambers's Journal*. Marston thinks Payn made a mistake in issuing this novel anonymously, and in his *Literary Recollections* the author is of the same opinion. Payn made Marston believe he was only a go-between for another author; but the publisher guessed the truth at once. The arrangements with the French publishers of Victor Hugo's works were troublesome. *Toilers of the Sea* ran through ten or twelve editions; but there was little profit left upon his *Ninety-Three*, for the English rights of which fifteen hundred pounds were paid. Of Louisa Alcott's *Little Women* and its successors, Marston says that 'children all the world over are the best judges of children's books, and Miss Alcott's books have as much vitality in them now as ever; they bid fair to stand in the same rank as *Robinson Crusoe* and the *Vicar of Wakefield*.' The authoress said of *Little Women*: 'We really lived most of it, and if it succeeds that will be the reason.' She died at fifty-six, having made her family independent by her writings.

Of all the novelists Mr Marston had dealings with, R. D. Blackmore lent most lustre and profit to the firm. He turned up at 47 Ludgate Hill more than forty years ago, wanting a translation published of the first part of Virgil's *Georgics*, which appeared under the title of *Farm and Fruit of Old*. Blackmore was born at Longworth, Berkshire, in 1825, and died in 1900 at Teddington-on-Thames, where he had a fruit-farm. In appearance he was tall and muscular, dressed very plainly, and 'altogether looked very much like what he actually was by choice, a gardener and a vine-grower. His voice was gentle, deliberate, almost timid, and yet manly.' There was something very characteristic—some phrase or turn of a sentence—about everything he wrote, even his private letters. He wrote on tiny sheets of note-paper, in blue ink usually. How small his writing was may be judged from the fact that his one page of manuscript a day might make six pages of type. There are delightful little asides like the following in all Blackmore's letters to Marston, which add to their charm: 'But for you, *Lorna Doone* might never have seen the light. All the magazines rejected her, and Smith & Elder refused to give two hundred pounds for the copyright. . . . I have plenty of self-confidence simply because I know good work when I see it. . . . My vines are going on gloriously; white bunches hang like waterspouts, and black ones like far thunder-clouds. All things know my hand, and say (not without self-seeking) how much better is the grape than the gall, the fruit of the vine than the famine of the pen. . . . Any one looking at my vines would say, "This is your rôle, my good fellow; stick to it. Any ass can write novels (at least in the opinion of the publishers); but to make a vine needs intellect."' While he could pour an avalanche of abuse upon the setting up, punctuation, or lack of punctuation in a title-page, he was one of the most delightful of men to visit at Teddington when his fruit-trees were laden with apples and pears, and the strawberries, apricots, peaches, and cherries were in abundance; and he was proud of certain standard peaches. Just as delightful was Blackmore on an angling excursion, and on one of these outings he seems to have been saved from a fatal accident once by Mr Marston, junior. *Lorna Doone* came out in three volumes in 1869, but did not catch on until after it was issued in a one-volume edition in 1872. By 1882 Blackmore was called upon to pen the whimsical and delightful preface to a twentieth edition. *Alice Lorraine* was the author's favourite amongst his works, all of which have a large and continuous sale. No man better deserved the memorial tribute in Exeter Cathedral or the kind and true words uttered by Mr Eden Philpotts at the unveiling ceremony.

William Black came to the firm in 1871 with *A Daughter of Heth*, which ran through eleven editions in the three-volume form, and in a cheaper form has been going steadily ever since. The next best selling book of Black's was *A Princess of Thule*. It must have been a severe blow to Marston when Mr Thomas Hardy placed his novels with J. R. Osgood. Large sums were paid for novels published by George MacDonald, and the firm had no cause to regret having done so. It was a curious circumstance that MacDonald should sell the firm a novel, *Mary Marston*, a good and beautiful story, when that was the name of Edward Marston's wife, of his eldest daughter, and one of his daughters-in-law. The author knew nothing of this, and when he did know would not change the title! One regrets to hear that MacDonald's books grew to be 'too good, too pure, too honest for the growing frivolity of the times, and the sale fell off. . . . There is humour, sterling worth, and vitality in all that George MacDonald has written, and his work will live when much that has since obtained a flash of

popularity will be forgotten.' Not a few of G. A. Henty's books were issued by Low, and Marston calls Henty a 'rough diamond of the first water, hearty, sometimes boisterous, genial, generous, sympathetic, and simple-minded as a child. In him was no guile; he was always outspoken and honest.' W. Clark Russell's tribute to the firm and Mr Marston is one of the best things in the book; while Harrison Weir, Captain Mahan, James Hain Friswell (whose *Gentle Life* essays were a great success), Elihu Burritt, Sir W. H. Russell, J. A. Froude, Lieutenant-General Sir W. F. Butler of *The Great Lone Land*, and Captain Fred Burnaby, with others, are all passed in review. By arrangement with M. Hetzel of Paris, the firm have published one and frequently two books annually for Jules Verne since 1871, or fifty-five in all. They fascinated the boys of thirty years ago, we are told, and they still continue to do so, notwithstanding the continuous output of literature for young folks.

The firm has always been strong in travel books; and of all the authors with whom Marston has had to do, it is easy to see that he is proudest of his association for over thirty years with Sir Henry M. Stanley, who liked his publisher, and was in turn beloved. In fact, Marston does not think it has often happened in English publishing that the relations between publisher and author have been more congenial or more unique. Stanley's exploits, as recorded, have been seldom excelled in the literature of travel. John Camden Hotten the publisher had offered one thousand pounds for *How I Found Livingstone*. Marston was at Weymouth when he had a wire from the firm regarding a call from Stanley and the offer of that book. Marston never did a better day's work than when he cabled back, 'Secure Stanley at any price.' The critics and the public were grudging in their appreciation of Stanley at first; but his magnificent record of travel, *Through the Dark Continent*, of 1878 fairly took the world by storm. Sir Edwin Arnold said: 'The work itself is an Odyssey of travel, admirable, gallant, unique, with a style *sui generis* like the swing of a traveller's stride.' Marston once met Stanley at Cairo, and afterwards related in a booklet how the traveller wrote *In Darkest Africa*. He also arranged for the publication of the book in America, Italy, France, Germany, Spain, Portugal, Sweden, Norway, Denmark, Holland, and Hungary. The firm issued all Stanley's other books, and Marston sums up his character by saying: 'I certainly can speak no ill of him, for I know nothing but good. Scrupulously true and just, he was tender-hearted, gentle, and kind, and most generous and open-handed when any charitable object was presented to him.' Stanley, on his part, used to bless the hour when he became acquainted with such an amiable friend. Mr Marston has done a good day's work, of which he may well be proud.

In conclusion, it is interesting to note that Mr Marston condemns the practice of paying authors large or small sums in advance on account of profits which may never be realised. He thinks this is due to the gambling competition which is the spirit of the age. The true principle, he believes, is not to advance any money, but to allow every book to stand on its own merit. Let the book earn its original outlay first, and then the profits that follow should be divided between author and publisher according to agreement. An equally satisfactory arrangement would be, he thinks, to pay the author a royalty on all copies sold as may be agreed. In this case the publisher usually takes the risk of the cost of production.

Whatever method is taken, the groaning shelves of our circulating libraries show that, for one reason or another, there is a vast over-production of books, many of which are forgotten in less than a single season. Some of the books for which Mr Marston has acted as introducer to the world will live on well into the twentieth century.

BETWEEN TWO.

IV.

RS LAUGHTON'S dance was a success, and mainly owing to the fact that she had two such charming girls in her rooms as Trixy and the fair American. It was very odd how Trixy contrived to make Frederick Seymour dance so frequently with Miss Jaggers, who wore a still more wonderful garment than the afternoon frock which she had trailed across Miss Shepperton's lawn. This evening-dress was a marvel of beauty, costliness, and simplicity. Beside it Trixy's pretty gown, white and sheeny as it was, looked absolutely plain. Yet her radiant eyes, her vivid colouring, made the other's flower-like face seem more than a thought too pale.

But, despite the 'understanding' at which Seymour imagined they had arrived that afternoon, Trixy contrived to divide her dances with absolute impartiality. Two waltzes and one polka 'sat out' was all she allowed her devoted slave to claim; whereas she so managed matters as to make him dance at least three times with the American. 'You look such a distinguished pair,' she told him, as she herself flitted about the room with anybody and everybody. Sometimes he fancied that her gaiety had a forced ring in it, but that might have been imagination. As they parted he whispered softly that he was coming to-morrow.

Miss Shepperton never allowed her niece to remain until the dregs of a party wore themselves out; therefore there were still two or three dances

left in the programme when she drove away in the summer moonlight.

'Did I behave well, and like a good little girl, to-night, auntie?' Trixy demanded when they reached home.

'I think you did. You managed cleverly enough,' Laura replied. 'No one could imagine there was anything between you and that nice boy; because he is a nice boy.'

'Yes, very.' Trixy was almost enthusiastic. 'But Captain Steve could teach him to dance.'

'My child, you don't want to dance through life; and, after all, what if *he* only fancies you?' Miss Shepperton turned so swiftly upon her niece with the question that Trixy started back.

'Fancies?' she faltered. 'Oh, but, auntie'——

'Ah! I know.' Her aunt sank into a chair. 'Listen to me, child. Once on a time, before you were born, there was a girl young and bright as you are. Just as young and as bright, heigho! She had lived a rather restricted life, had not met many people of her own age or class, until, in a somewhat unusual way, she was thrown into close intimacy with a man to whom nature had been unusually generous.' She paused and beat her fingers upon the table before her. 'Yes, unusually generous. He was handsome, and gifted with a beautiful voice, a ready wit, and that nameless thing called fascination. The girl had had many admirers, fancied herself in love with one of them, and—well, it was only fancy—the fancy born of propinquity—and the moment she met this man she knew that all her previous life was as nothing. And he—well, it was mutual; and for three months—ah! just three months—she lived and walked in paradise. Then came the awakening. The man—mind you, I neither blame nor praise him—had cast a chain round his neck, a bitter, galling chain. He had plighted troth with a woman whom he fancied, pretty, winsome, an accomplished coquette, older than himself; but he had given his word, and—and—as usual, it was the second woman who bore the burden. She sent him back to his betrothed.'

She was silent for a moment, and then: 'It broke her heart and spoilt her life,' she said slowly. 'She never married, because she never loved afterwards. That one passion swept her life bare. But she took up her burden bravely after a while, faced the world with it, worked hard—nothing like work to cure a heart-ache—and she came through it all.'

'Aunty, you—you were the girl?' Trixy gasped.

'I was the girl—I am the woman who now warns you. Take care. For my own part, I don't think you have more than a fancy for either of these men. Just think what it would be to find that out when it was too late! And then the man's side. If you could be sure that it was no fancy, but a real, true passion!' She paused and looked her niece straight in the face. 'I never heard whether that man's after-life was happy or the reverse. I made it a point of honour never to hear. I suppose he forgot me. I am quite ready to believe that I gave gold for spurious coin, poured out my life as a sacrifice, and for nothing; but then—— Ah! even now I cannot bring myself to look at the other side of the question.'

'He married her?'

'Yes, he married within the year. I know nothing more. Now go to bed and sleep.'

The girl did not obey her aunt's order until the early dawn was revealing the fair landscape in silvery tones round the quiet house. Possibly she too was remembering, although her stretch of memory only reached back a little space.

V.

FORTUNATELY it was only Stephen Marker who appeared at Miss Shepperton's on the day after Mrs Laughton's dance. It would have been awkward had the two men arrived together.

Beatrice met the young soldier with wreathed smiles, and yet he was not happy, for undoubtedly she made him keep his distance. She gracefully negatived his request to speak to her aunt. 'Ah! not yet.' After all, what had he to say to the good lady? She fenced gaily with him. How sweet it was to be here by the river-side while those graceful little boats went gaily up and down! For to-day they could sit and watch the scene.

Marker wanted something more. Truly, it was delightful to sit here beside this lovely woman; but he could not get away from the aching uncertainty. She was bright, fascinating, talking so brilliantly about the small party. What a pleasant dance it must have been, according to her description! But she had enjoyed it all in spite of his absence, and that imparted a certain sting. And he had so much to say to her, while time was passing. He was due at the barracks, because he was mess-president, and there was a tiresome dinner on. 'It's in honour of a fine old chap who once belonged to the regiment,' he said; 'but it's a horrid bore.'

Trixy was perfectly sympathetic. She seemed inclined to soften to the youth; yet, impetuous as he was, he felt she had hedged herself in by some mysterious icy barrier over which he could not pass. She watched him go, feeling honestly angry with herself because she cared so little.

'He is far—far too good for me,' she murmured as he passed out of sight. 'I wish I could care! Oh, I wish I could care!' and she sighed a weary sigh. 'Have I lost the capability to care about any one?' she asked herself, as with slow and heavy steps she turned away.

She stood looking down upon the river which flowed bright and clear below the wall that fenced her aunt's lawn. On the opposite shore the grounds of another and much more important place sloped to the water's edge. Trixy had heard some rumour of a new tenant at The Chase. She rather thought it was a person of consequence; but at the present moment local news had small weight with her.

Curious how her aunt's romance hung in her memory, even while she had so much to think about on her own account! 'She threw away her life "for a dream's sake,"' she murmured. 'Am I on the high-road towards making a like mistake, or was it a mistake? From a worldly point of view, decidedly yes; but otherwise'—— The beautiful eyes grew misty; the smile faded from her lips. 'I mind the day, I mind the day,' she sang softly, as the wistful strain beat about in her brain and drove her back into a Past which had become very real within these last days.

'After all, he didn't behave well,' she murmured, 'to leave me as he did—to drop out of my life. Beatrice Unwin, you are making a fool of yourself. Decide to put the whole thing out of your mind once and for ever, or else let everything slide, and remain faithful to a memory like Aunt Lulu.'

She drew a willow-wand slowly through her fingers as she mused; the long, delicate leaves seemed to have a message for her. 'Aunt Lulu is a noble, loyal-souled woman,' she thought. 'Could I do better than follow her example?' Then, with a hasty gesture, she snatched at the leafy rod. 'It shall be the Wand of Fate,' she cried aloud, and began to pluck off the slim green leaves, whispering to herself, 'Aunt Lulu—and fidelity; Stephen Marker—and forgetfulness.'

One by one she let the leaves drop from between her fingers into the water. One by one she saw them glide away on the languid current. Her thoughts seemed to drift along with them as they passed out of sight. Slower and slower became the slender fingers as the leaves lessened on the stem. She lingered over each green flake as if it indeed were a leaf from the Book of Fate. Only a few remained now. She would be honest with herself, and not count them, just let Fortune have her way; and, strange girl, she had made up her mind to abide by the decision.

She bent lower over the wall, her face pale in the reflected light from the waters. 'Fidelity! forgetfulness!' She had the words on her lips when, with a start, the willow-wand fell from her hand. She drew back with a choking cry, for a punt had shot from the opposite landing-place, and a face looked up at her: a face—the face—unseen for six long, weary years.

'I thought I could not be mistaken. It could be no one but you,' said a voice that had echoed in her heart so long that she had never hoped to hear it again.

She recovered herself by an effort. 'Mr Palmer!' she said. 'I never dreamed of seeing you here.'

'Perhaps as little I expected to find you,' he cried. 'I have been watching you through my glasses for ever so long, until I knew I was not mistaken.' He brought his boat skilfully under the wall, and, standing up in her, steadied himself by an arm thrown round the willow whose leaves had been acting the part of Fate. 'You have not forgotten me?' he asked, and his eyes were eloquent in the telling her *he* had not forgotten anything.

'No,' she said briefly.

'It is like coming back from the grave,' he murmured, his eyes feasting on her face. 'Why did you hide yourself from me?'

'It was you who went away,' she answered, her heart throbbing in her throat.

'I was compelled to go. My father'——

'I did not know your father was alive,' she rejoined. 'You never spoke of him.'

'I did not know him when I was at Hildon. My mother—— Ah! it is a sad story; but we are devoted to each other now. You will love my dear old dad, and he will love you. He knows all about—that summer-time.'

She was trembling from head to foot; her lips quivered. Surely life had taken itself out of her hands now, for weal or woe.

'May I hitch up my boat yonder at the slip? I can't go away until I tell you everything,' he said, never moving his eyes from her face.

'You may,' she answered steadily.

In a few moments he was at her side.

'I looked for you everywhere, and now, by the apparent chance of my father having taken a place on the river, I find you.' His eyes added, 'And I will never lose you again.'

Controlling herself, she told him she was no longer the unpaid nursery-governess of old days, but living with her aunt in ease and luxury.

'It 's like a dream to be beside you once again,' he said, bending towards her. Oh! all the old emotions came back like a swelling tide; and now it was no longer swaying between two. It was the taking up the old threads, the renewing of everything—joy, hope, first-love, the sweetest, tenderest renewal life has to offer. But she was not one to let herself go at a word. 'Why did you leave without making a sign?' she said, by a great effort keeping her voice at its usual level.

'I couldn't help myself; I was forced to go to my father at a moment's notice, straight from Cannes, where my mother died suddenly. It was to carry her last message to my father, of whom I had only heard, and the report was coloured by—by prejudice. But I did write. I told you as much as I could, and I went back the moment I reached England. Mrs Unwin led me to believe you were living abroad. She would tell me nothing.'

'She always hated me,' Beatrice said slowly, 'and she was jealous of dear Aunt Laura. Tell me about your father.'

'He had lived apart from my mother for years. It was altogether a sad tragedy; but I think my father was not so much to blame. You will love him, Beatrice, as I said before.'

There was a quiet way of taking things for granted with this masterful young man which Trixy felt there was no gainsaying. Nevertheless, she held back. 'Come and see Aunt Laura,' she said, and led the way to the house.

Miss Shepperton had been reading; she was so absorbed in her book that the new, radiant Beatrice was standing before her when she said in a voice with an entirely new note in it:

'Aunt Laura, I want to—I mean here is an old friend; I have not told you about him, but'—— She blushed and faltered. It was a new, transformed, transfigured Beatrice who drew the young man forward, and who said softly, 'Jack, tell Aunt Lulu. You must love each other, you two.'

Miss Shepperton stood up, her eyes on the young man's glowing face. Her lips parted slowly; her breath came in hasty pants. Just for a moment; then, controlling herself, she said:

'I know you by your likeness to your father; you bear his name, John Palmer. I knew him before you were born.'

He took the hand which she held out to him, and bent over it. 'I have heard of you, although your name was quite unknown,' he said. She made an effort to speak, but failed, because her heart beat so loud. Then she looked at the girl's face, and the tears sprang to her eyes.

After the man had left, Laura Shepperton put her hands upon her niece's shoulders and looked straight into her eyes.

'I can give you my blessing without the shadow of an after-thought,' she said. 'You have found the right man.'

'Oh auntie, you knew his father?'

'Yes,' she said steadily. 'I knew his father well.'

Captain Marker was rather taken aback by a nice little note from Miss Shepperton announcing her niece's engagement. 'An old affection renewed,' she told him; adding that she hoped all her acquaintances would like her new nephew. She sent an exact copy of the polite little epistle to Mr Seymour, adding that Mr Palmer was son to the celebrated General Palmer, who had recently settled in the neighbourhood.

That ended it; but as Stephen Marker soon afterwards joined the battalion of his regiment which was under orders for Burma, it was understood that he took the news somewhat to heart. Frederick Seymour was more philosophic; he married the beautiful young American, and whether he lived happy ever afterwards remains still to be proved.

. . . . . .

Four people walk by the river-side. The younger pair are going down to the boat-house; the elders watch them.

'How the tangle has smoothed itself out!' the man was saying with a quiver in his voice. 'It has been all a muddle and a misery since the night when we parted in the wind and the rain. Forgive me for speaking of it, Laura. I can't go on keeping at a distance from you. It isn't natural. I know you haven't forgotten. You remember what you said?'

'I told you I had forgiven you from the first,' the woman replied, 'and the darkness took you out of my life.' Her voice was level and steady. She could be friendly with this man now—for Beatrice's sake. 'I "dreed my weird." It is all over.'

'The darkness took me indeed,' the man returned; 'darkness such as you could never have known. There was the daily, the hourly strain—the strain that half-maddened me. At last I put half the world between me and'——

'Hush!' she broke out impetuously. 'There are things which must never be named between you and me—not if we are to remain friends, John Palmer.'

The man looked at her with hungry eyes. Verily, the years had dealt well with her—the woman whose life he had despoiled of its inheritance. For himself, he was still a fine-looking old warrior; but, as he had told her, life had been hard to live, for the chain galled sorely and the wound ached still. Was it to ache all his life long?

The woman's eyes were far away, following the two young figures moving on the landing-stage. She was silent until a little skiff shot out into the river, and the ring of happy voices reached them from the water.

'Life promises well for those two,' she said slowly. 'Yet it went very near shipwreck with my girl—the worst shipwreck of all. I guessed her secret, even while she seemed to hesitate between two men for whom she had only a passing fancy; but I had no idea that your son was the man.'

'Happily he did not wait too long,' the man said. 'Dear, is it too late to take up the broken link once more?'

He laid his hand upon her arm and compelled her to look into his face. Across the water came the wistful melody of which the niece was so fond. The aunt listened, and the man drew back, because the girl was singing the last verse of the song:

'And now I wish no wishes, nor ever fall a tear,
Nor take a thought beyond the way I'm led.
I mind the day that's over by—I bless the day that's here,
There be to come a day when we'll be dead,
Achray;
A longer, brighter day when we'll be dead.'

Laura Shepperton turned and faced the man who had spoiled her life.

'It is too late,' she said steadily—'too late for anything but the friendship that should exist between two old people whose young folks are knit together by the gracious bond they themselves have lost.' She stopped short, and pointed to the river. 'The river of years flows between you and me,' she said. 'Love is for the young.'

The man hung his head and went his way. Yet Beatrice Palmer has a faint foreshadowing in her heart that some day her aunt will cross the stream.

THE MONTH: SCIENCE AND ARTS.

THE BACILLUS OF CANCER.

RUMOURS have again and again been promulgated that a cure for cancer has been discovered, and the hopes of sufferers have been raised only to be disappointed. The X-rays and radium were both credited with being specifics in the treatment of this terrible disease, and the newspapers, ever eager for sensational paragraphs, lent their aid to the reports. It is to be hoped that the alleged discovery by Dr Doyen of the bacillus of cancer, and the preparation from it of a serum which has proved effective in the alleviation of the malady, have firmer foundations; and from the report of the committee appointed to deal with this important matter this would seem to be the case. Professor Metchnikoff, of the Pasteur Institute, who may be regarded as the leading member of the committee, reports on behalf of his colleagues that the bacillus discovered by Dr Doyen is found habitually in cancerous tumours. And as regards treatment with the serum, it is stated that it always produces in cancerous tumours alterations of a favourable character sufficiently rapid to diminish their volume and to render operation possible two or three weeks after the beginning of the treatment. It may be asked why, if a distinct bacillus is always associated with cancerous tumours, it has not been discovered before. Twelve years back Dr W. Russell claimed to have made this same discovery while attached to the Edinburgh Royal Infirmary, and papers were read by him before the medical societies on the subject.

OFFICIAL ATTITUDE TOWARDS SCIENCE.

Sir W. Huggins, President of the Royal Society, at the annual dinner of that body, in calling attention to the constant lack of funds for carrying out important scientific investigations in this country, asserted that the expenditure by Government on scientific research and scientific institutions, on which its commercial and industrial prosperity so largely depend, is wholly inadequate in view of the present state of international competition. This he considered due to the absence in the leaders of public opinion of a sufficiently intelligent appreciation of the supreme importance of scientific knowledge in all industrial enterprises and national undertakings. He compared the small response made in this country to any appeal for scientific objects with the liberal endowments made in the United States. He attributed this scientific deadness of the nation in great measure to the too exclusively medieval and classical methods of our higher public schools. The President of the Royal Society gave no specific instance of official parsimony in matters scientific, but there was certainly one ready to his hand in the recent closing of the Ben Nevis Observatories. After doing excellent work for more than twenty years, these institutions, built by public subscription, have to cease work for want of a few hundred pounds per annum, for which the Treasury of the richest country in the world has been appealed to in vain.

UNBREAKABLE CHINA AND GLASS.

Much interest was excited a couple of decades ago by the introduction of a toughened or tempered glass which refused to break under ordinary blows and shocks. Whether the material possessed some inherent defects we do not know, but it seems to have died a natural death. The subject is in a manner revived by the manufacture at Liége in Belgium of a kind of table-ware of fine transparent china which does not number brittleness among its faults. It is of sufficient importance to form the subject of a recent report by the United States Consul, by whom we are informed that the material will withstand all ordinary shocks, can be thrown about on a stone floor without fracture, and can actually be used as a hammer to drive nails in wood. These advantages are brought about by a special hardening process, and have much to do with the nature of the crystallised body used in the manufacture. In appearance the china is blue-white, not the pure white of ordinary porcelain. Glass-ware which possesses corresponding qualities is also being made by the same firm of manufacturers.

THE HIGHEST TUNNEL.

The highest European tunnel is that of the electric railway now in progress which is designed to reach the summit of the Jungfrau. This tunnel commences at an altitude of more than a mile above sea-level, and the working face is now nearly a mile higher than that. The work has been in progress for more than ten years, and the slowness of the advance is attributed to the very hard nature of the rock to be pierced, which precludes the employment of quick-working drills. But the workmen have had no difficulties to contend with in the way of water incursions, as in the case of the Simplon tunnel, and hitherto they have not in any way suffered from mountain sickness, a malady which will be a constant menace and source of anxiety as the summit of the Jungfrau is approached.

PRINTING PHOTOGRAPHS IN OIL.

In the early fifties Poitevin, a well-known photographic experimentalist, patented a process by which a photographic image could be printed in a pigment mixed with oil. It seems to have been entirely neglected by the photographers of that time, and has long been forgotten. But it has, quite recently, been rediscovered, and the method has been seized

upon by advanced amateurs as one peculiarly fitted to give them that control over the light and shade of the print which they consider indispensable. The process is briefly this: Good stiff cartridge-paper is coated with gelatine, dried, and subsequently sensitised in a 2½ per cent. bath of potassic bichromate. Once more dried, it is exposed to light beneath a negative in the ordinary manner. Soaked in water, those portions of the picture which have received most light have become insoluble, and do not retain moisture, while the 'lights' swell up and absorb much water. It is proverbial that oil and water will not mix, and when a roller charged with oil-colour is applied to the print only the insoluble shadows will have anything to do with the colour; they receive it, while the lights of the picture repel it. The process is an interesting one, and although of such ancient date, may be regarded as still in an experimental stage.

A NEW EGG-TEST.

The purchaser of an egg has no ready guide by which he may judge of its age; and as the term 'new-laid,' as employed commercially, has such elasticity that it may mean anything from a few days to many weeks, he is always at a disadvantage. A new and simple test has, however, been recently published in the German papers, by which the age of even a shop-egg can be correctly gauged, the method being based upon its floating-powers in brine. Every one knows that at the end of an egg there is an air-space, and that while this is represented by a mere dimple in a really fresh specimen, the space increases with age, and that extremity of the egg naturally becomes more and more buoyant. A perfectly fresh egg will assume a horizontal position in the brine; when it is from three to five days old the end tips up and its long axis forms an angle of twenty degrees; at eight days old it will assume an angle of forty-five degrees, at fourteen days sixty degrees, at three weeks seventy-five degrees, and when a month old it will stand vertically upon its pointed end. A scale is attached to the glass vessel in which the brine is held, so that the angle assumed by the floating egg can be easily read off.

COLOURED WOODS.

The use of coloured woods in the construction of furniture has long been known, the material being stained after the necessary seasoning process. A method has, however, recently been introduced by an Austrian inventor by which the wood is coloured when in a green state. By means of heavy pressure in a closed vessel the sap is driven out of the wood and is replaced by the colouring fluid, which may consist of a solution of the more permanent aniline dyes. The best kinds of wood for treatment are found to be birch, beech, alder, plane, elm, and lime; oak, fir, and pine being unsuitable, because they do not take the colour uniformly. The coloured wood is used not only for furniture-making, but for the manufacture of doors and window-frames. It can also be employed for outdoor purposes, in which case no painting is necessary, although a coating of varnish would seem to be a necessity. For the fittings of ships, railway-carriages, and tram-cars this stained wood appears to be eminently adapted. Of late factories for the working of the process have been established in Sweden.

ROLLER-BEARINGS ON RAILWAYS.

Ball-bearings, which did so much for the cyclist, are found to be impracticable for the heavy loads associated with railway traffic; but rollers of great hardness throughout their length have been proved to materially add to the efficiency of the heaviest vehicles. For two years past a carriage fitted with these roller-bearings has been running between London and Brighton, and has altogether covered a distance of eighty thousand miles. The axle-boxes of this carriage have recently been opened, and the bearings show hardly any signs of wear. This hopeful result has determined the Brighton Railway Company to have an entire train fitted with roller-bearings, and to have it placed in competition with a train not so fitted, so that the advantages of the new system may be carefully noted. By reducing friction, these bearings greatly lessen the expenditure of power in traction, while the load carried can be increased. The patentees of the system claim that as a result of their use there is a saving in coal of ten pounds per train mile.

THE DISAPPEARING BLONDE.

Some time ago a German savant carried out some investigations which went to show that blue eyes were so much scarcer than they used to be as to lead to the deduction that eventually Europe would have no more blue-eyed inhabitants. Possibly he would have come to a different conclusion had he visited some of our British seaports and fishing-villages, where blue eyes, for some unexplained reason, are extremely common. Blue eyes and golden hair often go together, and we are now told by Professor Mason, of the Smithsonian Institute at Washington, that girls with fair hair are disappearing so rapidly that he anticipates that in about six centuries they will become extinct. He accounts for this lamentable result by the circumstance that blondes possess a lower vitality, are shorter-lived, and are more susceptible to the evil effects of urban life. Admirers of the blonde type of womanhood, who can be numbered by the million, may take comfort in the thought that before another century has passed facilities may be found for changing the colour of the eyes according to taste. The problem has already been solved with regard to the hair.

TUBERCULOSIS RESEARCH.

At a recent meeting of the Imperial Commission appointed by the German Government to investigate the relations existing between human and bovine tuberculosis bacilli, some very important

statements were made in the course of a report by Dr Weber on the work that had already been done by that body of experts. The results of investigation point to the belief that bovine and human bacilli are biologically absolutely distinct from one another. Examination of the bodies of fifty-six persons who had died from the disease showed that in six cases the bovine bacillus was detected, while in the fifty only human bacilli could be found. Of the six cases three were children, and it is presumed that they received infection from the milk of a diseased cow. In two other cases bovine bacilli appeared in the glands and human bacilli in all other parts of the body. These are regarded as distinct cases of double infection. One other most important discovery was that of the two kinds of bacillus in one lung. The conclusions so far arrived at by the commission are that consumption in human beings is caused by the human bacillus, but that infection by bovine bacillus is possible, and that all precautions should be taken to guard against it.

ANTS AS PETS.

A few years ago, when the study of natural history was regarded as the hobby of a few enthusiasts rather than as a necessary branch of education, the gift of an ants' nest as a Christmas present would have been regarded by the average recipient with something akin to dismay, if not disgust. But times and manners change, and during the recent festive season ants' nests have in many cases been presented instead of the ordinary knick-knacks. The nest takes the form of a case somewhat like a picture-frame, about one square foot in area, and the space between the glass front and back is little more than a quarter of an inch. This is filled in with carefully prepared earth in which no fungus can find a foothold; and the earth being populated with about two hundred ants, the operations of the sagacious insects can be studied through the glass. All the food required is a morsel of honey and a little water about every six months, and the colony is calculated to last for at least six years. As a means of inculcating a taste for the study of nature, such a gift as that of one of these ants' nests must be highly commended.

THE ENERGY OF OCEAN WAVES.

Much has been written concerning the height of ocean waves, and upon no subject do observers differ in their estimates as on this. It has been recently stated that at the Dover Harbour works, where occasionally tremendous destruction has been wrought by the stormy waters, no wave of a greater height than fifteen feet has been recorded. At other places on our coasts the measurement of waves has run to forty feet. There is a great discrepancy here, which may very probably be due to want of uniformity in the methods of record. There seems to be little doubt that the depth to which wave-action extends is much greater than has hitherto been supposed, and the *Scientific American* has recently given proofs of this. Lobster-pots placed in from one hundred and twenty to one hundred and eighty feet of water have been found after a heavy gale to be filled with sand and shingle. Sand has also been found in the gallery of the Bishop's Rock Lighthouse, one hundred and twenty feet above the water, while the depth of the water at the same spot is one hundred and fifty feet. A further proof that the water must be moving with great momentum during a gale is afforded by the fact that at the Peterhead breakwater blocks of concrete weighing forty-one tons and lying at a depth of thirty-six feet below spring-tide low-water have been displaced during a storm. Upon one notable occasion a section of this breakwater weighing three thousand three hundred tons was bodily moved for a few inches without dislocation of the brickwork.

A DRAUGHT-EXCLUDER.

Among the minor inventions which contribute towards comfort in the home may be favourably mentioned Smith's patent draught-excluder, which is easy to adapt to doors and windows and has a neat appearance. By its aid a strip of felt can be secured over a draughty crack without the necessity of nailing, and the said strip can be removed with ease for cleaning or renewal. This is brought about by the use of spring rosettes constructed of brass, which are affixed with a single pin to the woodwork at intervals of about nine inches. The felt strip slides into these little fixtures and closes the aperture from which the unwelcome draught comes.

WOODEN WATER-PIPES.

It is by no means uncommon in the city of London when a street is 'up' to see lying along the curb a few lengths of wooden water-pipes which have been unearthed by the excavators. These are simply trunks of trees, generally about nine inches in external diameter, with the rough bark still visible on their surface, and with a bore of about four inches diameter. One end of each trunk is hollowed out, while the other is pointed, so that they can be fitted into one another in a continuous length. These pipes date back to the seventeenth century, when a water-supply was first brought to the Metropolis from Hertfordshire by the New River Company. It is interesting to note that wooden pipes for the conveyance of water on a very large scale are in use to-day, not in our own country but on the Pacific slope. These pipes, some of which are many feet in diameter, are made of Californian redwood (*Sequoia sempervirens*), and are constructed with staves and hoops like an ordinary barrel. Where sharp turns are necessary, an elbow-joint of cast-iron, or of steel in the case of the larger pipes, is introduced. These pipes serve many important industries, and one of their most valued features is that they can be transported piecemeal and put together when they reach their destination.

The wood is of very light weight, and is exceedingly durable.

A COSTER ANTIQUARY.

In the course of a lecture delivered to the London Topographical Society by Mr F. H. Price, it was stated that the greatest collector of metropolitan antiquities was the late James Smith, a Whitechapel costermonger, who could neither read nor write. He was the buyer of unconsidered trifles in every place where old buildings were in course of demolition, and from the habit of parting with his 'finds' to collectors he became an ardent collector himself, and in course of time filled his premises with relics of Roman, Anglo-Saxon, and medieval times which were of great antiquarian value. He had a wonderful memory, and could recount the history of any specimen in his collection. Moreover, he knew the localities which were most likely to yield specimens of Roman origin.

THE COLUMBIA BOTTLE-STOPPER.

It would seem difficult to find a better substitute for cork as a stopper for bottles, although the glass-marble stopper, rubber, and paper-cork are used to some extent. Mr F. W. Menzies, Edinburgh, has given a demonstration with an American machine which cuts metal corks from prepared strips of tin, inserts a tiny ring of rubber, and by a swift process on another machine, fastens the tin stopper over the neck of the bottle so that all air is excluded, and it cannot be removed by hand. The inventors are Mr Lewis Kalling and Mr Albert Jones, and the machine is made in Baltimore, U.S.A. Strips of prepared tin are fed below a punch, which stamps out the discs. These travel round and receive a tiny ring of rubber inside, and are dropped out ready for insertion on the neck of the bottle. It is said that these stoppers will be sold at one shilling a gross, and that with the patent stopping-machine it will be possible to close from fifteen hundred to eighteen hundred bottles per hour.

TO PURIFY WATER.

Dr George T. Moore, director of the United States Laboratory of Plant Physiology, has made known (Bulletin No. 64, Bureau of Plant Industry) a method of using copper sulphate or blue vitriol in water so as to be non-injurious to human life and yet so active that it will destroy virulent cholera and typhoid bacilli in a few hours. In an article upon the subject in the *Century* for December 1904, examples are given of how many American reservoirs have been purified and cleared of algæ by this process without danger to human life. It is never intended, however, to supersede slow sand or other methods of filtration. Copper money is looked upon as the dirtiest coinage. The Health Board of New York made experiments to find out if currency spreads disease. A microscopic examination of coins and paper showed that almost every silver and gold coin and paper bill carried from hand to hand swarmed with germs. Not a single disease-germ was found on any copper coins. Diphtheric germs were smeared over copper cents, and the effect was watched. The germs were dead in a few hours. Dr Moore issues the warning that no inexperienced person should use the copper treatment. A microscopic analysis of the water is first necessary in order to learn the number and character of the organisms, and whether the water is hard or soft.

A NEW TIDE AND RIVER MOTOR.

A patent has lately been granted to Mr Arthur Oates of Bradford for a new kind of water-motor of the endless-chain class, but working under a guided head of water and in connection with an iron or timber dam. Owing to its simplicity and the great capacity which can be given it, it is claimed that it will enable low river-falls to be utilised with profit. The chief aim of the inventor, however, has been to devise means by which power may be profitably obtained from the fall of tide-water into and out of coastal inlets with such motor-dams constructed across their entrances. It is stated that the power would be available for about three hours together, with similar intervals, which would give twelve hours of work per lunar day. Although not so convenient as steam-power for many purposes, there are many others, such as pumping, and some of the new electro-chemical and metallurgical processes, requiring large amounts of power, to which intermittent action will be no objection, or none but which would be more than counterbalanced by its lower cost; being computed to cost less than a quarter that of steam-power. The patentee, who has studied the subject for over twenty-five years, gives some interesting original tables showing the amount of power latent in and available from tidal action.

SLEEP!

Sleep! Though the winter winds are sadly moaning,
And hungry waves beat ever on the rock-bound shore,
A gray-robed Dawn is coming, though she tarries
Till Night's grim orgy with the deep is o'er.

Sleep! Though thy loving heart grow faint with watching,
And Night broods ever on Life's troubled deep;
Far through the clouds another Dawn is stealing.
God, in His love and mercy, send thee sleep!

MURIEL RAIKES BROMAGE.

*** TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

A STORY OF THE BASQUE COUNTRY.

By Cecil North.

CHAPTER I.

On a lovely September morning in 1891 a man and a woman sat out in the glorious air beside the débris of their lately finished breakfast.

The table, bearing on its snowy bosom a pleasant load of such good things as the country afforded—including the remains of a dish of fresh-caught trout—was placed under a vine-clad *pergola* built of chestnut poles, which were clinging to the eastern side of a little red-roofed cottage facing the rising sun. The cottage crowned the summit of a low and rocky hill.

The little eminence rose in solitary state from a green and level stretch of cultivated ground formed by the sudden widening of a length of one of the rugged valleys which are to be found everywhere along the French, or northern side, of the Pyrenees, and which, beginning amid the foothills, run a tortuous expanding and contracting course far up into the fastnesses of the range.

Overhead, dangling within easy reach of the pair, hung luscious bunches of fast-purpling grapes, while in the valley below a gleaming silvery ribbon wound its graceful way through fields of yellow Indian corn and rich green pasture, now softly losing itself in the leafy depths of a wood, now noisily rattling over some pebbly stretch with true Gallic vivacity.

Completely enclosing this beautiful scene, great mountains towered up into the brilliant blue, their weather-worn scalps emerging from the wooded lower slopes in scarred, fantastic shapes. The little hill itself, so closely did it resemble them, might have passed for one of these proud, defiant summits shed during the throes of some mighty, long-past convulsion, to find a resting-place in its present lowly position.

Not a breath stirred the air, which was already beginning to warm up after the freshness of the autumn night, while sombre bees and brilliant beetles hummed and pried about, carrying on with their wonted fussiness the absorbing business of their lives. A pair of still wet wading-trousers hung in a shady corner slowly drying, and against the wall there leaned a slender fishing-rod, whose smooth and glistening length was being industriously explored from butt to top-ring by a string of inquisitive ants. Of all the palpitating life about, man alone was idle.

Presently the woman sighed deeply. 'Heigh-ho!' she said, 'I wonder what the answer will be. Do you think that we shall get it to-day, Jack? Do you think that there has been time for your letter to reach London and for us to get an answer already, if they wrote at once?'

'Don't know, dear,' replied John Foster gloomily between the puffs of his cigarette; 'but we shall soon see, for there comes Jean;' and he nodded his head towards the farther end of the valley, where the blue-smocked, red-collared figure of the village postman had just come into view.

Slowly sauntering along, his handkerchief spread over his cap as a protection against the sun's rays, this easy-going official was absorbed in a flimsy newspaper which he had deliberately abstracted from its wrapper and meant to study from end to end ere replacing it and delivering it to its rightful owner, the curé. In this illicit manner he was wont to gather the news of the day, which he then retailed to the outlying farms as he went his long and toilsome round, getting in exchange cigarettes innumerable and so many glasses of strong country wine that his wobbling steps as he made his way homeward in the late afternoon unequivocally supported the testimony of his brilliantly coloured nose.

An important personage was Jean, who knew more about the inner lives of the inhabitants of the valley than even 'Monsieur le Curé' himself, in spite of the pull which the latter's profession gave him. Three-fourths of the rough Basque

[*All Rights Reserved.*]

farmers were illiterate, and it was Jean's congenial task not only to read but to answer their rare correspondence for them, he thus becoming the receptacle into which they were obliged to pour the histories of their most private affairs.

So, although the worthy old curé knew that 'Gros Pierre' had told many lies and got hopelessly drunk last market-day in the big town in the plain—and had given him a fitting penance accordingly—the postman knew that the bibulous one's daughter, who was in service in Bordeaux, had written to tell her father that she had lost her place and was without any money to go on with, because the valet had given her a kiss or two on the staircase, quite unaware that her mistress was looking at them from above. And I ask you, which was the most interesting item of news? Gros Pierre was always drunk on market-days, and at no time was remarkable for his veracity; but kisses on staircases entailing such dire and unreasonable consequences were something to talk about indeed. Oh yes, there could be no doubt about it whatever, Jean was the most important person in the valley.

But his slow and literary progress, however acceptable to the easy-going Southerns, was distinctly irritating to the impatient Anglo-Saxon, and presently there rolled down the valley what at first sounded to Jean like the roaring of an infuriated bull. But as he approached nearer to the hill these weird sounds resolved themselves into shouts of 'Now then, you lazy beggar, hurry up, will you? Do you think I mean to wait all day while you read other people's papers?' and much more to the same effect, issuing from the white-walled cottage.

The scandalised and astounded man could hardly believe his ears; never had such an outrageous thing happened to him before in his long and bibulous career, and for one wild, mad moment he felt almost as if he could find courage to punish its author by not going near him until he passed again on his return. 'But then,' he reflected, 'the English, if all mad, and apt to do more with their hands than gesticulate, are also all millionaires, and are currently reported to give large and generous tips—even as much as two francs—on New Year's Day;' so he hurriedly thrust the curé's paper into his bag and made towards the roaring almost faster than he had moved since '70,' and he had moved very fast indeed on one or two occasions in that dreadful year, he still remembered with a shudder.

Puffing and blowing, he scrambled up the rough path that led to the top of the hill, and, shaking in his rope-soled shoes, gave up his papers and letters. But, instead of the terrible reception he fully expected, he was presented with a rank but much-appreciated black cigar; and, filled with astonishment, he bundled down again on to the level, more firmly convinced than ever that the Anglais were the most incomprehensible race in the world, and that the stories that he had heard about their selling their wives by auction and always living in a black fog were far short of the truth.

Among the correspondence was the letter so eagerly expected, and John Foster read it with a scowling face; his wife, in her anxiety to know its contents, looking over his shoulder as he did so. It came from a firm of solicitors in London, and was couched in the usual curt style generally affected by legal gentlemen, except when announcing the falling in of a legacy or some other equally pleasant business, the pickings of which they hope to handle. It ran:

'Sir,—In answer to yours of the 10th instant, we beg to inform you that our clients, Messrs Samuel Moses & Company, decline to accede to your request for delay in payment of the bill held by them for one thousand pounds, drawn by Captain Rookam and accepted by you. Unless, therefore, we receive your cheque by return we shall at once issue process against you for that amount and costs, without further notice.—We are, Sir, your obedient servants, Pract, Sharp, Ise, & Son.'

'Brutes!' said Foster.

'Oh dear, what's to be done?' wailed his wife. 'Why, oh, why were you so weak as to believe such a man as Rookam? You might have known that he was a horrid cheat. I felt sure that there was something wrong about him the very first time I ever set eyes upon him. Trust a woman's instincts; men are such fools that they never see an inch before their noses. How can we send a cheque when we haven't got any money to speak of? What will they do, do you think?'

'Bring an action against me—which, of course, I can't defend—get judgment, and put a bailiff into our house at home, and sell all the furniture and things, I suppose,' answered Foster disgustedly. 'A nice thing to happen when it is so well let, and a nice thing for our tenants as well; they will have to get out, and I shall have to repay them the rent they paid in advance, and how I am to do it licks me. But,' he continued, changing to a lighter tone, 'I don't think you can reproach me with being taken in by Rookam, little woman. If I remember rightly, you once said that he was one of the nicest of my friends, and the type of an honest English gentleman. Your woman's instinct seems to have been in abeyance for a while—eh?—or else you have a very bad memory.'

'That's nothing whatever to do with it,' cried Mrs John wrathfully. 'You always twist and turn my words so as to make me out inconsistent;' and the little lady flounced out of the room in a highly indignant and explosive state, and presently the maid-of-all-work was loudly weeping.

After his wife's departure Foster became very grave. His position was a serious one. His income came entirely from his pen, which of late seemed to have lost its cunning, to judge by the increasingly frequent return of manuscripts sent in by him with-

out a doubt of their acceptance. As he had a couple of sons at public schools, money had been getting scarcer and scarcer every month, and at last he had been obliged to let his house at home—the furniture alone was his—and retire with his wife to the little mountain cottage where he now was, to live as economically as possible, free from the expenses attached to life in his position in England.

Unfortunately for him, he had been led, before leaving, to listen to the glowing accounts of a certain enterprise under the fostering care of his friend Rookam—an enterprise free from risk, and certain to lead to large profits, according to the noble captain. No money was required of him. His name on a bill—a mere formality, he was assured—was all that was necessary. So, tempted by the hope of relieving his financial embarrassments, and with perfect belief in Rookam's sincerity, he succumbed to the latter's wiles, with the painful result already described. He turned the matter over in his mind in every direction, but could see no way out of his scrape. The furniture must go, and even then he feared that it would not fetch enough to pay the debt. Besides that, there was the question of his tenants. How could he repay them the rent advanced to him? Why, they might even sue him for damages for being turned out! It was a terrible prospect for an honourable man, whichever way he looked at it.

Thus, in gloomy thoughts, Foster passed the long, hot day, his brow remaining clouded, though his wife Nellie had long since got over her little tantrums.

Towards evening a farmer's son, a bright, cheery lad of thirteen or fourteen, came up to the house with a basket of peaches to sell. He was a great favourite of Nellie's, and she often gave him a few halfpence for himself over and above the price of his fruit, and, what he almost liked better, any old picture-papers that she might happen to have received from England. On this occasion he had one hand, which seemed to be causing him much pain, roughly bound up in a dirty rag; and, on inquiry, Mrs Foster found that he had severely hurt a finger while doing some job on the farm.

'Poor Bertrand! let me arrange it for you,' she said; and presently her deft fingers had properly dressed the injury and relieved the aching digit. Full of real gratitude—which he was shortly to prove in a marvellous manner—the little lad, with empty basket but with a fistful of sous, trotted away to his friends in the village, proudly exhibiting his clean bandage and loud in his praise of the gentle Anglaise.

'You spoil the boy, Nell,' grumbled poor, worried Foster; 'and, besides, we cannot afford to give away a single sou now. We shall want every one of them soon to buy bread and butter if I cannot get more of my work taken than at present.'

'They shall be the last, darling,' answered his wife, bending down and kissing him. 'Cheer up. I feel certain that we shall get out of the wood all right. Something is sure to turn up presently to help us—you see if it doesn't.'

'You little female Micawber!' smilingly answered John, patting her sunny head. 'That's the way: never say die; and now suppose we take a stroll in the cool before dinner, and afterwards I think I'll go down, if you don't mind, to the river and try those new night-flies I tied yesterday. The white-fellow that I am going to call the "Nellie F." should do well about ten o'clock, for after such a hot day the fish will feed until very late, I expect.'

Following out this idea, Foster, duly arrayed in brogues and waders, took his rod, and going down the hill about eight o'clock, struck the winding road that more or less followed the course of the river from end to end of the valley. His intention was to go up-stream into the mountains, and make for a long and deep pool which, owing to its position between almost perpendicular walls, where the river flowed far below the road, which was carried over the shoulder high above, was seldom fished, and was consequently well stocked with trout. It was a most difficult place to reach at any time; but Foster was an expert fisherman, and knew every yard of the river for a long way both above and below his house, and he felt confident that, in spite of the darkness, he could easily reach and leave the narrow strip of shingle on the edge of the pool that afforded the only place from which a fly could be cast or a trout landed. He had several times fished the pool during the daytime, and he was sure that he could do it equally well at night. The river was now extremely low, and there was no danger; and if by any chance a long and heavy thunderstorm caused it to rise, there would, he knew, be plenty of warning and time given him in which to make his way out of the gorge. So, pipe alight and busy with his thoughts, he made his way along, happily unconscious of the dreadful ordeal that awaited him, and which was to lead to such momentous consequences.

His wife, of course, stayed at home. She detested these night-fishing expeditions of her husband's, although the latter seldom indulged in them. He knew that she disliked being left alone, though not actually nervous; and she, on her side, knowing how dearly he loved his sport, and recognising the value of mutual tolerance of each other's foibles, made no objection when he did once and again propose an evening raid. He always told her the exact locality that he had selected for his operations; but on this occasion he unaccountably forgot to do so, an oversight to be deeply regretted later on.

It must have been past nine o'clock when—after much rough walking and endless scrambling over rocks and slippery boulders, which he could never have successfully negotiated without the help of the light from a tiny lantern he always took with him on these expeditions—he at last arrived at the pool, and, wading in knee-deep where the water shallowed on the strip of gravel, got to work with

his new white fly. He had not made many casts into the darkness with a line little longer than his rod before he felt—he could not, of course, see the rise—a heavy tug, and found himself holding hard on to a fish that was evidently above the average weight. But a stout grilse-cast which he had expressly mounted for this kind of work enabled him to give his captive little law, and in a couple of minutes or so to drag out on to the shingle, *nolens volens*, a lusty two-pounder. And so the merry game went on. Never moving from his position except when landing a fish, he allowed the gentle current in the pool to do what it liked with his fly, and carry it where it willed, and every now and again the welcome tug would come, and another (though not on every occasion) fat trout would find its way into his basket.

It was rather weird work this night-fishing in the lonely gorge buried away deep in the heart of the mountains, for the silence was oppressive to a degree. A young and watery moon caused fantastic and grotesque shadows to spread themselves about, and by their deep-black stains intensify the uncanniness of the chasm. Strange thoughts persisted on crowding into his brain, and the distant hoot of an owl or sullen flop of a feeding fish came almost as a relief to the tension.

But by eleven o'clock the owl had gone to bed, or at all events had ceased to utter its plaintive and melancholy note; and the trout also seemed to have satisfied their appetite, for such rises as he could hear were growing rarer and rarer, and the sudden pulls, that never failed to make him start in spite of his preparedness, were now few and far between.

With an uneasy feeling that he ought really to be going, and yet reluctant to do so while a single fish remained feeding and there was a chance of feeling another of those fascinating tugs, Foster at length tore himself away, and coming out of the water, shouldered his heavy basket and prepared to begin his difficult journey back again down the gorge until he could once more reach the open and quit the river-bed, cross the fields, and strike his homeward road. But at that moment a strange and distant sound caught his ear. At first he completely failed to make it out; but presently, listening intently, he felt certain that it was caused by people coming towards him, splashing and scrambling along the very path that he was about to take.

'What on earth could this mean?' he asked himself. 'What was bringing men to this inaccessible spot at such an hour?' His first idea was poachers intent on dragging the pool; but then he remembered the time of night it was, and that these individuals never deprived themselves of sleep in order to carry out their nefarious practices. It was not necessary. Nobody troubled their heads about the fishery-laws in this remote corner of France, and the netsmen had only to wait until the dusk tempted the trout to leave their rocky sanctuaries and come into the open pools to feed to carry out their poaching work successfully. They had no fear of being interrupted. The gendarmes and the solitary *garde pêche*, the people charged by the State to look after the river, discreetly kept the high-roads, or, better still, the village café, after dark. What would you? The fish were put into the river by the *bon Dieu* to be caught somehow or other. A worm in the light, or a net in the dark, it was all the same to them; and, besides, the fish were very good to eat, especially on Fridays. So, as long as somebody or other was always ready to make them a present of some of the bright little fish, they neither asked any questions as to the catching of them nor troubled the river with their attentions. No; poachers the approaching men certainly were not.

Could they be *douaniers*? Of course, that's what they were. How stupid of him not to have thought of it before! Why, the land swarmed with them, and they patrolled the mountains night and day along the frontier, and the thousand rough paths that led to it, in vain efforts to suppress the smuggling carried on in vast proportions between their own country and Spain. But then, again, they always hunted in couples, and the sounds that had so startled him emanated from several persons at the very least. Perhaps it was a large force of them about to raid a band of smugglers? And then there flashed upon him the true solution of the mystery. He had not to do with anything so pleasant as either poachers or *douaniers*, but with a gang of determined smugglers plying their exciting trade.

Foster had heard a good deal about these gentry. Indeed, it would be difficult for anybody, whatever his nationality, to live for any length of time in a remote Pyrenean valley such as this without coming into almost daily contact with them. Nearly every able-bodied man took a hand in the game—the dangerous part of it—that is to say, the getting the stuff over the frontier and safely hiding it in cellars and lofts; while the women and children carried out the work in its less arduous stages, distributing the goods piecemeal by means of a thousand little tricks and devices to their customers and receivers of all sorts in the bigger towns in the plains. The chances were, therefore, that the approaching men were from his own village, and in consequence, knowing who he was, and aware that they had nothing to fear from him either directly or indirectly, would not, he hoped, molest him in any way. Still, he felt that if he could avoid a rencontre and let them get past and go higher up the river without seeing him, it would be quite as well. Civil as they usually were, and friendly even, in their cottages and fields, they were at best but a rough lot of fellows; and out here, in this wild and lonely spot, far removed from any restraining influence, goodness only knew what their French excitability might not lead them to do in the first blush of such an unlooked-for meeting.

With these ideas in his head, our friend, therefore, at once sought about for a likely place of

concealment; and noticing that in the steep wall of rock behind him there appeared a place that, in the uncertain light, seemed climbable, for a short distance up at all events, he determined to try it, trusting that he might discover some ledge or hollow wherein he could stow his long length out of sight.

(*To be continued.*)

TARAPACÁ AND THE NITRATE INDUSTRY.

By W. J. KIRKCALDIE, Iquique.

'EVER heard of the place' will probably be the first thought of most readers of the title of this article; it may therefore be well to mention that the province of Tarapacá forms the most northerly part of Chili, and is bounded on the north and east by the republics of Peru and Bolivia respectively.

The chief and practically only circumstance which gives the Desert of Tarapacá any claim to the interest of the outside world is the fact that it is the centre of the nitrate of soda industry, which business has led to the investment of many millions of pounds, and attracts numbers of Europeans who have an interest in or come out to work for the numerous companies engaged in this occupation.

Chili is, I believe, the only spot where deposits of nitrate of soda exist in workable quantities and conditions, and whence large quantities of the prepared nitrate are shipped yearly to all parts of the world.

As one nears the shore from the sea, the general impression is that of a rocky and absolutely barren coast, rising abruptly out of the sea to a height of about two thousand feet. Sailing up the coast, one sees here and there what look at first sight to be a few sheds on the beach, but which on closer inspection prove to be small townships of varying sizes, the ports from which are shipped the nitrate sent down from the interior.

The capital of the province, and the most important town connected with the nitrate business, is Iquique. As the harbour is approached, a smoky haze proclaims to the new-comer that a town of some size is built on the foreshore; and as the ship drops anchor one witnesses such a scene as might inspire a painter of Christmas pantomime scenery, or be the embodiment of some nightmare landscape.

Iquique is a town of about thirty thousand inhabitants, and is built on the shore between the ocean and the *pampa*, which latter rises abruptly to an altitude of about two thousand feet, some two miles from high-water mark.

The streets are fairly well kept, and as a rule run at right angles to each other and at regular intervals. The houses are mostly built of wood, with no pretence to symmetry, and are often painted in fantastic colours, giving one the impression of a tumble-down and chronic Earl's Court.

Like all Chilian towns, Iquique has its *plaza* or square. Here the fashionable—and otherwise—members of the native community promenade in the evenings to hear the band play and to meet and be seen of each other. The centre of the *plaza* is laid out in ornamental gardens, and many of the inhabitants of this part of the world have never seen any vegetation other than is grown here.

Walking down the principal street, which is well made and about a mile long, one sees little or no evidence of comfort. Inside the houses, however, the display of wealth comes as a surprise, as much of the furniture and most of the fittings are in European style, and frequently of European manufacture. The majority of the houses have a balcony or veranda, from which vantage-point the fair *Chilenas* show themselves off on holidays or other suitable occasions.

There is a large British colony in the province, and an English church and English club furnish evidence of the desire to hold our own out here; while on special occasions a glimpse of H.B.M.'s consul in uniform brings 'England, home, and beauty' vividly to mind. The municipality own a very good theatre, in which Spanish and Italian companies perform from time to time. The Chilian has small use for a theatre in darkness, and it is curious to see the actors on the stage while the auditorium is a blaze of light. What is the use of clothes, jewels, and cosmetics if they are hidden from the public gaze?

The English club is the focus of the Britons in the province, and there is a regular supply of current newspapers and periodicals, with special cablegrams on occasion.

Business goes on much the same as in London, though the hours are different. Most houses open at 8 A.M., and work till 5 P.M., with a break of an hour for breakfast at midday. The trade and commerce is dependent upon the production and output of nitrate of soda, sent down from the interior; but everything necessary for life has to be imported into the province, as there are no natural supplies of food, or, indeed, anything except air. At one time water was brought in boats from Peru; but in recent years a system of pipes from the Cordillera provides the port with fresh-water.

There is little or no domestic life in Tarapacá, the climate and artificial conditions of life operating against such a thing. The hotels are bad, and unless a new-comer can arrange to join a mess—of which there are several—there is small comfort in life for a bachelor, as 'board and lodgings' are practically unknown; and even if by good luck a furnished room or rooms are obtained, no meals will be served, and a hotel is the only resource.

The cost of living is very great, as everything has to be imported, and the duties on most articles are extremely high—so much so that, though salaries are good and incomes as a rule large, fifty pounds a month does not go very far.

After business hours the usual places of fashionable resort are the Sports Club and an *al fresco* restaurant situated on a small bay about a mile from the town. The former place has tennis-courts and skittle-alleys, with a racecourse and polo, football, and cricket grounds adjoining. In the afternoons there is usually tennis or bathing, and later, when the electric light is turned on, skittles are played—with intervals for refreshment—until dinner-time.

The ladies dress extravagantly, and it is curious to see costumes which would not disgrace church-parade in Hyde Park in a place which is nothing more nor less than a small town built on a sandbank. The shops are good, but the prices are correspondingly high, and one is tempted to get as much as possible direct from home. There are one or two private motor-cars; and, wonderful to relate, one sportsman (a Scotsman) has a dogcart, in which he drives tandem. There is only one decent road, of about two miles in length, so these vehicles seem superfluous, and are an evidence of the desire to make the most of things.

The backbone of the province, some even say of Chili, are the nitrate deposits on the *pampa* between the Cordillera of the Andes and the coast. A railway provides the means of communication between the nitrate works (or *oficinas*) and the port. The first thing which strikes a stranger on arriving at the station *en route* for the *pampa* is the number and appearance of the passengers. The third-class carriages, which are large and roomy, are generally full of a hot, dirty, and odoriferous mixture of humanity, comprising Chilians, Bolivians, and Peruvians, with a fair sprinkling of Chinese and Japanese. The majority are workmen employed by the various *oficinas*, who, with their families, seem always able to find sufficient money to come down to the coast for a holiday. Fortunately the management provides a reserved carriage for the benefit of supersensitive Europeans or others, and the charge of five dollars (or six shillings and tenpence extra) is not excessive, meaning as it does freedom from close quarters with undesirable people who too often exude fumes of garlic. The usual journey occupies about five hours; and this being across a hot, sandy plain, any small comfort is cheap at almost any price.

On leaving Iquique the train climbs diagonally up the face of the coast hills, and after about two hours one finds one's self well up on the *pampa*, with the Andes in the far distance. The whole landscape is one which prompts the inquiry as to whether the country was made before the creation commissariat turned up, or whether it was left till all supplies had been exhausted. For thousands of square miles there is no trace of either animal or vegetable life, the only creatures which appear to live in a natural state being flies—in millions—and a species of buzzard, which feeds off the carcasses of such mules and oxen as die and are left unburied on the *pampa*. The general impression is that of a desolate waste of rocks and sand, with a blazing sun and relentless glare all the year. There is no weather in Tarapacá, there being neither rain, wind, nor cold. The only change is an increase of heat in summer (December to February) and the presence of occasional clouds (or *camanchacas*) on the high grounds in winter (June to August).

As the train speeds along at the rate of about ten miles an hour, a fine, flour-like dust envelops it, penetrating into everything. Here and there can be seen the various nitrate works, spread about at distances of from one to ten miles from each other. They are uninviting in general appearance, as the workmen's camps give a squalid look to the whole place.

Many of the administration houses, where the manager and clerks live, are, however, very comfortable, and as far as possible the well-being of the employés is carefully looked after. The usual style of a *pampa* house is that of a one-storied building arrranged in a square, with an open court (or *patio*) in the centre. They are mostly built of wood, in order to withstand the frequent shocks of earthquake to which the residents of the province are treated.

Each *oficina* has to depend upon itself as regards the working, as there are no factories or stores where repairs can be made or provisions obtained; the majority of *oficinas* having their own shop (or *pulperia*), in which the workmen can buy the necessaries and some of the luxuries of life. In fact, an *oficina* is in reality a small village, where from five hundred to fifteen hundred souls live, move, and have their being.

There is little variety in the daily life on the *pampa*, there being nothing to do but work, eat, and sleep all the year. Sundays are not observed as official holidays; but there is usually a slackness both in the office and out on the grounds. The work in most places goes on day and night; but in the office the hours are from 8 A.M. till as soon after 5 P.M. as the clerks are able to finish. Breakfast is at 11 A.M., lunch at 3 P.M., and dinner about 7.30 P.M. Of recreation there is very little, the isolation and nature of the country preventing much pleasant intercourse with neighbouring works. Riding and tennis can sometimes be indulged in; but the scarcity of new faces and the unattractiveness of the surroundings do not conduce to much activity in search of amusement. Indeed, one of the worst features of life on the *pampa* is the terrible depression which comes on when one realises the loneliness of his position and the stagnation, or worse, of intellect. Even nature appears to have deserted the place, and were it not for the splendid climate, life would be little better than that of a convict settlement.

Poverty, as met with in a great city, is unknown

on the Tarapacá *pampa*. Food—of a kind—is always obtainable, and the absence of wet or cold makes housekeeping (?) a small affair to the working-man. A few skins or sacks keep him warm at night; and as his family grows, and he wishes to add a new wing to his residence, he merely puts up a rough scaffolding and nails a quantity of sacks to it. Filth and dirt seem to find willing hosts in the ordinary *oficina* camp; and children, dogs, pigs, and goats are mixed up in an unassorted living jumble.

Amidst it all, one is struck with the superficial politeness to be met with. It is quite usual to hear the poorest people, when meeting, say, '*Buenos dias, señor*,' or '*Como le va, señorita?*' which in literal English mean, 'Good-day, sir,' and 'How do you do, miss?'

In the administration houses there is a strict observance of precedence, and visitors are treated with the respect which their relative positions appear to warrant. On rising from table nobody moves until the honoured guest has first passed out, and it is odd to see the employés lined up, waiting for the manager and visitors to leave the room.

All the same, in spite of this deferential behaviour, a native will clear his throat and—well, a strong stomach and familiarity with such customs alone enable one to continue eating.

The making of nitrate itself is a comparatively simple process. The raw material (or *caliche*) is taken out of the ground at depths varying from five to twenty feet, and has to the unskilled eye the appearance of dirty limestone rock. This is carted to the machinery (or *maquina*), where it is crushed to a small size; it is then carried to the boiling-tanks, and steam and hot-water are turned on until the tank is full. After some hours of boiling, the solution is drawn off and run into cooling-tanks (or *bateas*), in which the liquid is allowed to remain for some days. At the end of the requisite time the surface water is drawn off, and a white deposit of nitrate of soda is left. This is thrown on to the drying-yards (or *canchas*), and exposed to the sun till most of the moisture has evaporated. The nitrate is then ready for putting into bags and sending to port for shipment.

It is a curious freak of nature that in the place from which one of the richest and best-known of fertilisers is taken there is not so much as a blade of grass. Some day it is possible that the Chilian or some other Government, or some enterprising company, may start a scheme for irrigating the *pampas* in the north of Chili, in which case I can scarcely picture a more delightful spot to live in; for, with vegetation and animal life, the Desert of Tarapacá would be transformed into a veritable Garden of Eden.

GIANT CIRCUMSTANCE.

By JOHN OXENHAM, Author of *Barbe of Grand Bayou, Bondman Free, John of Gerisau*, &c.

CHAPTER IX.—BROKEN LINKS.

IT was a golden afternoon in May when the leisurely transport nosed its way up the muddy estuary, and finally landed Geoff in Southampton; but it was late in the evening before his work was done and he was free to run up to town.

He hammered joyfully on the well-known door in Portman Square, and greeted the man who opened it with more joviality than he would have believed possible.

'Hello, Bourne! How's everybody?'

He felt like a schoolboy home for the holidays, or, better still, done with school, and home for good and all.

The man's eyes lightened at sight of him, but he looked so solemn that Geoff's face fell involuntarily, and he felt a chill of foreboding.

'Miss Ellen and Lord Exmoor are in the library, Mr Geoffrey,' said Bourne, and Geoff hurried along the passage.

Ellen sprang up to meet him as he entered, and gave a little cry. She was in deep black, as was Charles Doone, who stood behind her. Geoff looked anxiously from one to the other. Exmoor, he knew, was dead, and Charlie reigned in his stead.

'Oh Geoff!' said Ellen, with her arms round his neck, 'you have not heard? Dear Uncle Carrick died last Thursday. We buried him to-day;' and her tears fell afresh at thought of it all.

Geoff sat down suddenly and gazed at them hollow-eyed and speechless. Was he in any way responsible for this fresh disaster? Verily, he began to fear that misfortune dogged his heels.

Charlie Doone, to whom we may now accord his proper title, caught a glimpse of something of the kind in his face, and said quietly, 'It was at his club, Geoff. Sudden heart-failure, instantaneous and perfectly painless, and not unexpected either by himself or his doctor. Old Pargiter says he might have gone off any moment of the last six months, although he always looked so hale and well. The Crimea has its revenge at last.'

Geoff nodded, and then said quietly, 'All the same, I shall always fear that the trouble I brought on him helped to break him down.'

'You need not, my boy,' said Exmoor, with quiet emphasis which carried conviction. 'On the contrary, your little affairs quite gave a fillip to his regular enjoyment of a grievance against the Jacks-in-office. It was a very genuine grievance, and he made the most of it.'

'I'm beginning to think I must have been born under an unlucky star. See what a difference this last six months has made: Eisenach, Cameron, Uncle Carrick, Exmoor;' and, though he did not say it, they knew that he thought of Una Devon.

'Don't get morbid, my boy,' said Exmoor cheerily. 'You were not responsible for either Exmoor or Uncle Carrick or Cameron or Eisenach. You've been having difficult times, and been working too hard, I expect, as an alterative. If you'll take my advice, you'll go and play for a spell now.'

'Yes'—with a weary stretch of the arms—'I want a rest, and to feel myself a free man. I had decided to send in my papers, unless the General set himself against it, and now'—— And a spasm of painful thought flitted across the lean face. 'Do you know, Charles, that the authority which makes one man the arbiter of other men's fortunes is a very terrible responsibility.' And he gave them briefly the facts of the fight at Tembé.

'We got garbled scraps of the matter at the clubs,' said Exmoor, 'and could make neither head nor tail of it. According to the strict letter of the law, I suppose you were in the wrong. But if Everett had pushed it home he'd have run his head against the wall. He was well advised to drop it. When a small-minded man gets to the top there is absolutely no end to the mischief he may make. What are your plans, Geoff?'

'I want to feel my freedom for a time. Then I had some idea of trying the diplomatic service.'

'I wouldn't decide to throw up your present hand too hastily, if I were you. Take a good off-spell, anyway, and think it over. You've deserved a rest, if any man ever did.'

'And you two? What about you?' asked Geoff.—'Nell dear, you are looking worse than I ever remember seeing you. You are wanting a change too.'

'I was trying to persuade her to *the* change when you came in,' said Exmoor. 'Join forces, my boy, and we'll prevail over her. A quiet wedding, as soon as possible—it's what Uncle Carrick would have advised if he'd been here, I know—and then I'll take her away to any paradise she chooses. What do you say?'

'I say yes, most decidedly, and the sooner the better.'

'I am quite content now that I've got you both here again,' said Ellen. 'The rest can very well wait.'

'Charlie is right, Nell. Life is not long enough to be wasted in waiting when you can pluck your fruit at once. Get married and get away.'

'Will you come with us?'

'As far as the church, my dear, and then to the station to see you safely off, but not a step farther. Three on a wedding-trip would never do.'

After dinner an adjournment was made to the cosy little smoking-room which had been General Carrick's sanctum, and Challis found himself constantly listening for the well-known footstep outside the door, and caught himself looking round every now and again for the cheerful face and familiar figure, and each time the fact that he was gone came upon him like a fresh blow. He could not quite realise it yet, for to him the news had come like a clap, whereas the others had seen the end, and the subsequent mournful ceremonies had ruled a broad black mark between the past and the present.

The evenings were chilly yet, and the fragrance of the peat-fire in the low open hearth mingled soothingly with that of their cigars as they sat and talked, discursively and with long silences, of the past and the future, of the dear old man who was gone, and of what lay immediately before them.

And one result of it was that they prevailed on Ellen to consent to a quiet wedding a fortnight later, and Exmoor made formal entry of the date in his pocket-book, lest, as he said, he should forget it or she should attempt to go back on it.

That important matter finally settled, he did his best to detach himself from his own concerns by taking Geoff's vigorously in hand.

'Now see here, Geoff, my boy; here's an idea for you. It's always as well to go slow when you're contemplating a new start in life.'

'Such as getting married?' suggested Geoff.

'That's a different thing altogether. When once your mind is made up and the other party's also, you can't be too quick about it. But about chucking the army. Don't be too hasty. You meet Everetts in every walk in life—even in the navy, though naturally less there than in any of the other services. And it's no light thing to jettison ten years of one's life. What you want is a big rest and time to tone up. You've gone through more than most the last few months. Now, here's a suggestion. The *Seamew* is eating her head off down at Gosport. Why not take her out for a month's run—Norway, or the Western Isles, or the Mediterranean, or wherever you like? Bannatyne would bless you. He's a good chap, and he's never quite happy when he's not on the move.'

'Why don't you go honeymooning in her yourself?'

'Nell wants the Tyrol and some secret place she knows of on Garda. She's pilot now. I'm only plain captain.'

'Well,' said Challis thoughtfully, 'I'm inclined to accept your offer, Charlie. I want to get away from everything for a time. I'll be pretty poor company for Bannatyne.'

'Ban'll be all right as long as he's moving. He's cultivated a most marvellous power of silence, through being so much alone, I suppose. Wouldn't you take one or two fellows with you? Maybe you'll'——

'Not this time, old man. Myself won't be over good company, I'm thinking; but it'll be quite as much as I can stand.'

Exmoor found it difficult that night to transfer himself from the snug little room and its pleasant company to his great lonely house in Hyde Park

Terrace. For though they were in the shadow of their loss, there was no bitterness in them. Uncle Carrick's life had been a long and strenuous one, blamelessly lived, willingly laid down when the time came. There was no cause for over-sorrow. Their grateful recollections of his unvarying kindness and unlimited goodness were their prayers for the repose of his soul.

When Ellen came back into the room she found Geoff smoking thoughtfully, with his eyes fixed on the crumbling peats. She knelt on the rug and built up the ruins, and laid a fresh coping on top, and then drew up a hassock and sat with her arm on his knees.

'It is such a joy to have you back safe and sound, Geoff. My heart is completely at rest for the first time in very many months.'

'It is good to be back, dear; it is very good to be back. You and Charlie will be very happy. He is a fine fellow. I do not know any other man I would have thought quite worthy of you, Nell. I have only one regret, and that is that I can't help fearing that the dear old man who is gone cannot have felt quite satisfied with me.'

'You are quite wrong, Geoff. If you had heard him speak of you, you would not have a shadow of any such feeling.'

'I am very glad of that. Anyway, he knows the rights and wrongs of it all now, and he will know that in all things I did the very best that was in me.'

'Do you think you will give up the army?' She was avoiding an inevitable question, and they were both fully aware of it.

'I feel like it at present. It galls one to rags to feel that all one's hopes and efforts may be blocked by the petty venom of any narrow mind. It is hard, you know,' he said bitterly. 'It is not the loss of position, and all that, that one has rightfully won. It is just the rank injustice of it all.'

'I know,' she said. 'It must be dreadfully hard to bear. In some it must poison and embitter all their lives. In your case there are alleviations.'

'Yes,' he said, patting the arm that lay across his knees. 'In my case there are alleviations; but, all the same, I feel like getting out of it and being my own man. Now, tell me, what news have you of Una Devon?'

Ellen's lips pinched a trifle, and if Miss Devon's eyes could, by any possibility, have looked out of the burning peats she would have found it difficult to meet the withering scorn that glowed in her old friend's face.

'You are well quit of her, Geoff,' she said quietly. 'I have never met her to speak to since you left. They say she is going to marry Belturbet.'

And the big top-peat burned through and fell apart before he spoke, and then it was very quietly.

'I am sorry to hear that. And I am very sorry for her. Belturbet will never make any woman happy.'

'Except Lady Eugénie,' said Ellen with unaccustomed viciousness. 'His father is not expected to last the year out, and Una will be Duchess of Cashel, and miserable for the rest of her life. But I think Lady Eugénie will be happy. Of course it is not she who is going to marry Belturbet.'

'The pity of it! What does Mr Devon say about it?'

'He has never said anything about it to me. I like Mr Devon, and I am sorry for him. He looks fagged and worried. Lady Eugénie can play the Tartar, I believe, when she is set on getting her own way.'

'It's horrible to think of Una marrying that fellow. He is simply an unutterable blackguard.'

'Charlie puts it even stronger; but then he's a sailor-man, and they have a natural gift that way.'

'Well,' said Geoff after a long silence, 'if you have any idea of getting to bed before to-morrow morning, my dear, we'd better be moving;' and she kissed him and went off, grateful for the sight of his quiet face.

But for five months he had been assured in his own mind that all was over between himself and Una, and he had been quietly putting all thoughts of her away from him.

All the same, it was something of a blow to hear that she was to mate with such a one as Lord Belturbet.

(To be continued.)

NOTES FROM THE DIARY OF A LONDON MERCHANT.

By JOHN B. DRAYTON.

PART I.

WHILE I retain my memory unimpaired I will note some of the more remarkable incidents which occurred in a long business career.

ANIMAL CHARCOAL.

About the year 1858 it came to our knowledge that sugar-refiners in the United States, instead of revivifying the animal charcoal they used, sold it for manure purposes after using it once only. This animal charcoal was of very fine quality; we therefore employed an agent in the States to purchase and collect this article from the refiners. It was then packed in good hogsheads and shipped in fifty-ton parcels by sailing-vessel to London. At that time there were several sugar-refiners in London; and

although they were difficult of access to strangers, it so happened that we were well in with some of them, and we readily sold the parcels of charcoal, as they came to hand, to these firms. We obtained a price about double the first cost; so that, although the expenses were considerable, it was a good business. But large quantities were not obtainable. Of course we could always have sold it at a price for manure purposes, in case of need.

A DEAL IN WHEAT.

In 1868 the price of English wheat exceeded seventy shillings per quarter. In April of that year the representatives of a banking firm at Naples offered us three thousand quarters of white Barletta wheat at the price of fifty shillings per quarter f.o.b. Barletta; shipment in June, as soon as it was harvested. This is a fine and heavy quality, and in that climate, provided the weather was good, the wheat was in condition to be threshed as soon as cut. This seemed a tempting transaction, although somewhat speculative, and we bought the wheat. The point was to get the wheat to England before the English harvest.

When the time came we sought for a steamer to bring the wheat to London. We applied to the Austrian Lloyd's, and they offered us a steamer at six shillings per quarter, which we accepted. It turned out that this was an English steamer, with an English captain; the boat being under charter to the Austrian Lloyd's. The wheat was harvested in splendid weather, and the steamer arrived at Barletta at the right time. Then a curious thing happened. We knew, and we thought everybody knew, that Barletta was an open roadstead; but neither the Austrian Lloyd's agent here nor the captain realised this. When the captain got to Barletta, and discovered this, he seems to have lost his head; for although, of course, he had to wait till he could get his cargo on board, it being shipped by craft according to the custom of the port—and there was no undue delay, as the weather was perfect—the moment he had the last boatload on board he sailed *without signing bills of lading*. This rendered him and his steamer subject to arrest; and also it made the Naples bankers very angry. They threatened all kinds of disagreeable action if we did not hand the cash to their correspondents in London at once. This, of course, was impossible, as we had *nothing* to show that the wheat had been shipped. However, the Austrian Lloyd's representative (who was a bank director), the Naples bankers' correspondents, and ourselves agreed that the arrival of the steamer should be awaited, we handing over the cash as soon as it could be ascertained that she had the wheat on board; meanwhile, the policy of insurance being handed over to the bankers' correspondents.

In a few days the steamer arrived all in order, the money was paid, and the captain got a good wigging. Though this was well before the English harvest, we told our factors not to warehouse any of the wheat, but to sell *ex* ship as fast as it had to be discharged. We obtained from sixty-three shillings and sixpence to sixty-two shillings and sixpence at the last—an average of over sixty-three shillings, and so brought a nice little speculation to a happy conclusion. This transaction was unique. Such a thing had never been done before, and I am sure it has not been done since.

BICHROMATE OF POTASH.

About the year 1856 there was only one manufactory of this article in Great Britain and one in France. There was a good demand for it, and the price was ninepence per pound. The French manufacturer had an entire monopoly of the French market, as there was an import duty equal to about elevenpence per pound. Cobden's treaty was only negotiated some years later. The sales of the French make were made by two important houses, one in Paris and the other at Rouen; and we had business relations with both these houses. The manufactory was at Havre. We were often pressed to take up the article, but the difficulty was that it was, in the English Customs tariff, subject to a duty of 10 per cent. *ad valorem*.

At last it occurred to me that we might get this duty removed. We imported a ton to London, and employed a Custom-House agent to try and get the Board of Customs to admit it duty free. We had our own idea of the grounds on which we might succeed; but the agent thought he knew best, and went his own way to work, and failed. So we had to pay the duty. Feeling that this was due to the agent's obstinacy, we brought a second ton to London, petitioned the Customs ourselves, and ultimately obtained a Customs order admitting the article duty free. This order was addressed to us, and, as far as we knew, was not brought to the notice of others. We then made arrangements for a monthly supply of ten tons, had it shipped from Havre to Southampton as 'chemicals,' and naturally sent down the Customs' order to Southampton. To avoid letting the Scotch makers know of this competition, we sold the article in London to a large drysaltery house whose headquarters were at Leeds, but who had a warehouse in London, where the railway company delivered it. Curiously enough, the French make was so exactly like the Scotch—the identical *nuance*—that it was impossible to distinguish one from the other.

The discovery of the magenta aniline colour ended this business. Bichromate of potash was largely used for that, and the price advanced to thirteenpence per pound. The demand in France took all the French make at high prices, and no more was to be had for England. When we went to see the manufacturer at Havre about this he was greatly grieved, and actually shed tears. Some time before, he had intended to enlarge his manufactory, and with that object in view had instructed his agents to propose to us to enter into a contract for several years to take fifteen to twenty tons a month,

the price we were then paying to be the maximum, a *pro rata* reduction to be made whenever the English price was below ninepence. The agents, thinking that they knew their principal's business better than he knew it himself, and considering this a one-sided proposal, merely made us the offer at the fixed price, which of course we declined. The manufacturer, therefore, did not enlarge his manufactory, and now could not supply the home demand; and, in fact, through this mistake of the agents both he and we missed the chance of making a large sum of money.

A BROKER'S ADVANCE.

A produce broker in a large way of business in the City of London, who was believed to be not only honest and honourable, but in fact rather strait-laced, made an advance to a brother-in-law upon a parcel of iodine. This brother-in-law became incapacitated, and had to relinquish business; and when the iodine came to be sold there was a deficiency, including interest, of about three hundred pounds, which the debtor was quite unable to pay. A considerable time afterwards the father-in-law of this brother-in-law died, and *then* the broker claimed of the executor payment of this amount as due to him by the father-in-law! The executor was a physician, who knew nothing of business, and he was astounded at this claim, because, as he said, his father would never have bought anything he could not pay for. If he had owed money he would have paid it at once, and certainly would not have rendered himself liable to pay interest at the rate of 8 per cent. and 10 per cent. per annum, which was charged in the account for part of the time when the bank rate stood at these rates. Ultimately the broker agreed to submit the question to my decision. It happened that I knew more about the matter than he supposed.

Imagine, then, the meeting at the broker's office. Present—the broker, his old bookkeeper, the executor, and I. The broker's partner was there, but he maintained a detached position, and stood on the rug with his back to the fire. The first question was, could they produce any authority from the father-in-law to debit him with the account? They could not, and so they were forced to maintain that the original transaction had been with him! To establish this they could produce nothing but a page in their ledger with his name at the top, under which was the entry to his debit, 'From Ledger C,' or whatever letter it was. Having solemnly looked at that entry, I said, 'Now, then, for Ledger C,' and they could only absolutely refuse to produce it—talking about a slur upon their honour. Pressure on my part led to no further results, so I turned to the executor and said, 'This is evidently a fraudulent claim, and you should refuse to pay it.' The broker said nothing, but the old bookkeeper lifted up his hands to heaven and wondered how I dared say such things about one whose character stood so high as his revered master. I told him his opinion was not asked, and came away with the executor.

The executor, however, paid the money, and for this reason: The wife of the broker's brother-in-law was his sister; and as she had means, and the brother-in-law had none, the broker allowed him fifty pounds a year in order that he should not be wholly dependent upon his wife. So the broker told the executor that unless his claim was paid he would stop the allowance. This broker left one hundred thousand pounds at his death, and he had no family. I never spoke to him afterwards.

Perhaps the most remarkable part of this story remains to be told.

Several years afterwards, long after the broker had retired from business, I was staying at Eastbourne. The broker was staying there also. Having caught sight of me, he sent an ambassador in the person of a common friend, not once, but four times, to endeavour to induce me to withdraw what I had said; he had felt it most keenly all those years, said my friend. My repeated reply was, 'Let him produce that preceding ledger, and then we shall see.' Here was a rich man, probably thinking of the hereafter, desiring absolution at my hands without showing any sign of repentance and without restitution of that which he had dishonestly taken. A truly remarkable state of mind.

BANKING MORALITY.

One day a young man, whom I recognised as having been a clerk in the office of one of my business friends, came to me and said that he knew of some bills which were in the hands of a London bank, and which were forged—'fabricated' would, I believe, have been more exact. He personally had nothing to do with them, but he was ready to give evidence if called upon, as, knowing about them, he did not know what he ought to do; and, having given me the particulars and his address, he left the matter in my hands.

I went to the bank in question, at that time a private one, taking with me one of their old customers. I told them what I had been told, and offered to produce the young man. The banker said they did hold the bills, to the amount of about nine hundred pounds, and they had already come to the conclusion that they were forged or fabricated. They were very much annoyed, because the man who had fabricated them and discounted them at this bank was introduced by a valued customer; and it turned out that he had only opened the account with the bank *in order to discount these bills*. In the result, the bank took no steps whatever against the forger, but worried the old customer who introduced him till, in a fit of extreme irritation, he paid them the money they had lost through his introduction.

TROUBLE ABOUT A BALTIC CARGO.

We once had a cargo from the Baltic by a Danish vessel. By the charter-party there were twelve

days for discharging. The captain was cantankerous, and first demanded full payment of the freight before commencing to discharge. We agreed to pay half, and the balance on completion of the discharge. When he had delivered half, he wasted a day in trying to get us to pay the balance of freight. In the end he claimed one day's demurrage; and as we refused to pay he took out a summons, which came before Commissioner Kerr. Our broker entered the goods, and the action was brought against him. I dealt with the case in person, the court of course supposing *I* was the broker, as when the case was called on I said, 'Here.' I took a preliminary objection that the merchant, not the broker, should have been sued. The judge took note of this; but as he found we were ready to fight on the merits, the case went on. The captain had sailed, but the ship-brokers, a solicitor, and a young counsel in wig and gown were there. First the charter-party was put in, with a translation of the Danish (which cost quite a guinea), and the judge read out, 'Twelve running days for discharge, counting from the day that the consignee has notice of the vessel's arrival.' 'What was the date of your giving notice to the consignee?' asked the judge. 'We could not give notice, because the bill of lading was consigned "to order,"' replied counsel. 'Then what fools you must be,' said Commissioner Kerr, 'to sign a document the terms of which you could not carry out!' Then I said, 'We will admit receiving notice the *day after* the vessel's arrival, when we saw her in the Customs List.' This pleased the judge, and won our case by giving us the extra day. Counsel made great efforts to overcome this, but the judge sat upon him, and gave judgment with costs. I said as a last word, 'We don't claim any costs.'

A PLEASANT MEETING.

In 1856 or 1857 I met a well-known carpet manufacturer in the north, at Paris. He was on his wedding journey. He told me that they paid a young man a large sum—two thousand pounds a year, I think—to design *only* for them. This was *very* high pay for the designs he drew for them; but his talent was so extraordinary that it paid them to keep him wholly to themselves. I went with the gentleman and his bride to see this young man, who was the son of a confectioner in the Rue de Rivoli, and he drew a very large and complete design or pattern without taking any measurements, just to show us what he could do. Every day at the *table-d'hôte* the waiter was sent to fill my glass with their champagne, that we might raise our glasses together; though their seats were a long way off, I could see them. One day, just as I was saluting them, a gentleman on the other side of the bride somehow turned a siphon full on to her dress—a very pale-blue silk—and, I believe, ruined it. But both bride and bridegroom showed the utmost *sang-froid*, and treated it as an incident of no consequence.

CONTINENTAL BUSINESS DURING THE FRANCO-PRUSSIAN WAR.

The Franco-Prussian war of 1870 caused us very heavy losses, directly and indirectly. For example, on one parcel of finest currants, in London a sudden fall in price took place which made a difference of one thousand pounds. We had a contract running with a Lyons manufacturer for his make of citric acid and tartaric acid. This contract was faithfully carried out; but as the workmen were called to the war, the production was diminished and the time of delivery prolonged, so that some was delivered after the close of the war, when the price rose considerably. Our principal market for these articles was in Paris, which, as the war progressed, was closed to us. We were obliged to sell in Lyons and in Switzerland, or bring them to London. To pay for the goods we were generally able to buy notes of the Bank of France in London—they were at a premium throughout the war. But once or twice we were compelled to send sovereigns *vid* Bordeaux. When Paris was invested we had a large number of bills running there, in the hands of our Paris banker. We found afterwards that every one of these bills was paid at maturity, without advantage being taken of the prolongation allowed by law.

One day a Paris correspondent advised us that he was sending us from Havre the sheep he had on his farm near Rouen, as he was determined those Prussians should not have them. The sheep never arrived. Probably the Prussians intercepted them.

We used to sell cargoes of arsenic to a firm having works in French territory, but close to Bâle. We shipped by sailing-vessel from Plymouth to Dunkirk; thence a special train of some fifteen or twenty trucks took the arsenic to Bâle, by *tarif international*, Bâle being in Switzerland. From Bâle our buyer carted it to his works. When the war broke out we had a cargo afloat, which arrived at Dunkirk just when the French army, with the Emperor and the Prince Imperial, was being despatched to the frontier by the Eastern Railway. The railway authorities therefore telegraphed to the station-master at Dunkirk that he must not forward any goods for their line. Consequently, in accordance with the Code Napoléon (the goods belonging to a foreigner), the cargo was placed in the Custom-House warehouse at Dunkirk.

As soon as the French army had been wholly sent forward, and the Prince Imperial had received his 'baptism of fire,' the Eastern Railway telegraphed to the stationmaster at Dunkirk (without any communication with us) to send the goods forward. A train was made up and despatched, and from that time till the close of the war we could get no intelligence as to what had become of our arsenic. As will be remembered, the Eastern Railway was again wholly taken up by the military.

I went to Paris as soon as it was open, to see about this and other matters. What a city of the dead it appeared to be! Few people about, no

waiters, very few cabs for want of horses, and such heat that one was afraid to walk in the sun or to prolong his stay. I remember that there were no cabs at the Eastern Railway, and I waited there a long time hoping a cab would turn up. At last one came bringing a lady. I secured the cab in haste lest some one else should get it, and driving off, had got some little way before I discovered that I was driving away with the lady's bonnet, which she had taken off because of the great heat, and placed on the opposite seat.

To return to the arsenic. I went to the Eastern Railway. They found by reference to their books that the greater part of it—for there were several tons short, for which they could not account—had reached Paris, and as they could not send it forward, they had, in accordance with the Code Napoléon, placed the arsenic in the warehouse of the *douane*. This, being Government property, had been burnt by the Commune. Thus had our arsenic disappeared! As the Eastern Railway people said, if it had remained in their warehouse it would have been safe, but being owned by foreigners, they were compelled to put it in charge of the Government for greater safety.

The missing quantity was found at a station between Dunkirk and Paris, the trucks having been somehow detached. There they had remained all through the war, the Germans happily not having found them, or having mistaken them for flour. We sent them on to Paris and obtained a good price, as Paris was bare of the article.

I may mention here that the very first thought of the authorities was to efface all sign of the damage done by the Commune. Workmen were everywhere effacing the marks of bullets upon buildings of stone. I particularly noticed this at the Madeleine, where the fluted pillars were badly chipped.

As regards our arsenic burnt by the Commune: first, I told the Eastern Railway people that I thought they could be made responsible, as they had ordered the goods to be sent on from Dunkirk on their own responsibility, and without consulting us. When the goods arrived in Paris, it was clear that they were bound to put them in the *douane*. Their answer was that we *might* succeed; but if we went to law with them they would naturally do all they could to defeat us; whereas, if we claimed from the Government they would do all they could to help us; and, to begin with, they could establish without doubt that the arsenic was placed in the *douane*, which was burnt with all it contained.

I went to our *avocat*, a first-rate man, and he took the same view; so we left the matter in his hands. There were, of course, others who had similar claims. These cases were never tried in the courts. They were the subject of long negotiations, chiefly between the Government and the city of Paris. By the Code Napoléon, in such case the city was liable unless it were the seat of the Government, in which case, as the insurrection or riot causing the loss might have been occasioned by some act of the Government, the Government was liable to make good the loss. As the Government at that time was at Versailles, the city of Paris was liable; but it was determined not to place it on legal record that the seat of Government was away from Paris, and consequently a compromise was arranged between the Government and the city. We were paid in bonds, which we sold for cash, and realised about 65 per cent. of our claim. There was no question from the first of disputing the liability to compensate us, either by the Government or by the city.

ONLY SAILING-SHIPS.

A most striking example of the advance made in all ways during the last half-century or so is to go back to the time when there were virtually no steamers and no telegraph. When I first came to the City we were shipping cargoes of Welsh rails to the United States to make their railroads. This business came into our hands in a curious way. A retail house just commencing business, having good credit but not too much capital, bought these cargoes on long credit, and the house I was with, having credits on Brown, Shipley, & Co., and other houses, advanced them cash, and sent the goods forward for sale on commission, charging our 2 per cent. This business was brought to us by a very respectable Jew, who had ⅛th per cent. for introducing it. As I had to pass his account and get him a cheque, and as the Covent Garden Opera was at that time in the hands of the money-lenders, I could always have a couple of amphitheatre stalls by asking for them, and I used this opportunity freely. I should add that the retail house became a large and flourishing concern.

It is strange to remember that at the time of the gold discoveries in Australia the only mail was one of Green's sailing-vessels once a month. Ship-letters were also taken by another line sailing monthly. These vessels were about ninety days on the passage. Thus it took more than six months to get a reply to a letter, and a further three to four months to execute an order and get the goods out. Shippers, therefore, needed the gift of intelligent anticipation. I remember a vessel being chartered in New York, and loaded with a very large quantity of tobacco, other goods in requisition by miners, and a lot of American 'notions,' which turned out very well indeed. A shipment from London of gorgeous brass coffin-ornaments sold almost for its weight in gold, as no one else had thought of it. When a miner died (as many did) his mates gave him a grand funeral, and these ornaments were in great request.

Some shipowners here made their fortunes. There were so comparatively few vessels about, and North American vessels which could be bought for two thousand pounds or so paid their cost in the outward freight on the first voyage. There was one drawback: the sailors were apt to go off to the

goldfields when the vessel reached the Australian port.

AS ARBITRATOR.

In the early sixties a Spanish merchant called on me and said he had an action pending with regard to bichromate of potash, and he asked me if I would be a witness in the case, as he looked upon me as an expert. I assented, and in due course received a subpœna, with three pounds three shillings. The case was tried before Chief-Justice Sir W. Erle and a special jury. The merchant had purchased and shipped some of the article, and claimed damages for unmerchantable quality. It appeared this was a remanufactured article, recovered after it had been used in the production of magenta, and it was not a success, at all events at first. My evidence was to the effect that it was not merchantable. The defendant's counsel, after trying to bully me, found that I knew a great deal more about the matter than he did, and at last the judge, addressing the jury, said, 'I think, gentlemen, the witness knows a good deal more than we shall get to know about this matter, and I think it had better be referred to him.' The jury, of course, assented. The judge then asked me if I would consent to arbitrate. I said it would depend upon who would represent the other side. After consultation, the defendant named Mr Perkins (the inventor of magenta), who was present, and as I knew him to be a first-rate man, I consented. We had a long document, signed by the judge, referring the matter to us, and we thrashed the question out, calling several witnesses. Ultimately, I am pleased to say, Mr Perkins came to my view, and my solicitor drew up our decision, and we claimed fifteen pounds fifteen shillings each. This was paid; but, as is often the case, the wrong side took up the award. At all events I cleared eighteen pounds eighteen shillings out of the business.

(To be continued.)

THE SCOTTS OF ETTRICK FOREST IN OLDEN TIMES.

By Rev. J. SHARPE.

IN days bygone Ettrick Forest was the home of the Scotts. There were Scotts almost everywhere: in Thirlestane, Tushielaw, Oakwood, Sinton, and Bowhill; kinsmen all, whether near or more remote, but, alas! very often at deadly feud with each other. It is said that one at least of our Border ballads owes its origin to these feuds: that of the 'Dowie Dens of Yarrow,' which is supposed by Sir Walter Scott to refer to a duel fought at Deuchar Swire, in the vicinity of Yarrow Kirk, betwixt John Scott of Tushielaw and Walter Scott of Thirlestane, in which the latter lost his life. The duel took place in 1609, but there is no positive information as to the place where it was fought, the Presbytery records merely stating that John Scott is ordered to be summoned by the minister of the Forest to compear before the Presbytery to see and hear himself decerned to be excommunicated for the slaughter of Walter Scott of Thirlestane. Sir Walter's theory as to the origin of the 'Dowie Dens of Yarrow' is disputed on the ground that the duellists were not brothers-in-law, as is stated in the ballad, and also that in the Presbytery records there is no implication of treachery or unfairness on the part of the survivor. The ballad is, therefore, supposed to refer to a later incident in the history of the families: to the elopement of a Walter Scott of Tushielaw with Grizel Scott of Thirlestane 'without the consent of her father and the order of the Kirk,' and his marriage to her in the kirk of Bellingham in Northumberland by the minister of that parish. In the month of July 1616, on their return to the Forest, the runaways were ordered to compear in the parish kirk of St Mary of the Lowes, and there publicly 'to confess their sin in omitting the order of the Kirk, and crave God's pardon, and desire the people in time coming to count them as married folks.' At the same time the Presbytery instructed their moderator to write to the 'guidman of Thirlestane,' and request him to absent himself from the kirk of the Forest on the day of the said Walter Scott's compearance, because of the deadly feud which exists betwixt the two families. On 22nd October 1616 there occurs the following entry in the records of Melrose Presbytery: 'Simeon Scott of Bonitoun, and his brothers John and Adam Scott, and Simeon Scott in Thirlestane, summoned at the Kirk of the Forest to compear at Melrose to hear themselves decerned to be excommunicated for the horrible slaughter of Walter Scott. Compeared not, whereupon Mr James Scott is ordained to proceed against them.' Professor Veitch and others have assumed that the Walter Scott who was slain was the Walter Scott who eloped with young Grizel of Thirlestane; and doubtless, if the assumption could be proved and the identity of the two established, the fact of the elopement, coupled with the deadly feud which existed betwixt the families, would afford an intelligible motive for the slaughter. It is significant that in Motherwell's version of the ballad there is a reference to the reaving of the lady. But in the Presbytery records, in the minute of meeting which precedes the one from which we have quoted, it is distinctly stated that the Walter Scott who was slain was of Easter Essenside, and not of Tushielaw. This only shows how extremely

difficult it is to localise the poem, or to find any incident in Border history where all the circumstances will fit into the story of the ballad. It is just as probable that the ballad may refer to a daughter of the House of Dryhope as to Grizel Scott of Thirlestane. Who knows but what Mary Scott of Dryhope, traditionally known as the 'Flower of Yarrow,' may have had a love affair previous to her marriage with Walter Scott of Harden in 1576?

There is a widespread tradition that Oakwood Tower, the property of the Scotts of Harden, was the residence for a time of the famous Michael Scott, astrologer and philosopher, but better known as the Wizard, who came south from his castle of Balwearie, in the vicinity of the Forth, and astonished the inhabitants of the Border district by

> Cleaving the Eildon Hills in three,
> And bridling the Tweed with a curb of stone.

Sir Walter Scott readily appropriated the tradition, and turned it to good account in his *Lay of the Last Minstrel;* but how much of it, or how little, he believed is quite another matter, for presumably he must have known that the tower was not built until three hundred years at least after the death of the 'Magician.' If we might venture a supposition as to the origin of the tradition which seeks to identify the Wizard with the gray and sombre tower in the heart of the Forest, we would say that very probably it arose from the confounding of the Wizard's name with that of a later Michael Scott, who obtained by Royal Charter in 1517 a gift of the lands of Oakwood. A stone above a window in the east wall of the tower gives 1602 as the date of its erection; and its builder was Robert Scott, laird of Oakwood at that time, the same who compeared before the Presbytery of Melrose in November 1607 for probation of the crime of perjury whereof he accused Mr Patrick Shaw, then minister of the kirk at Selkirk. Oakwood's charge against the minister was found not proven by the Presbytery; and for the slanderous words he had uttered the laird was ordered to appear in his 'paroch' kirk and be rebuked in face of the congregation. Alexander Justice, minister at Ashkirk, was ordained to preach in Selkirk Church and administer the rebuke; but on the day appointed Justice failed to appear, for which he was taken to task by the Presbytery and sharply censured by the moderator. In his absence, Patrick Shaw had to officiate himself, and the result of Shaw's interference was that 'the guidman of Oakwood,' instead of making his confession, 'railit on the minister and called him opprobrious names.' It may be interesting to know that Patrick Shaw was the immediate successor in the kirk at Selkirk of John Welsh, son-in-law of the Reformer Knox, and that he was an ancestor of the great Sir Walter Scott; his great granddaughter, Christian Shaw, having been married to John Rutherford, minister of the parish of Yarrow, whose son, Professor Rutherford, was the maternal grandfather of 'the Shirra,' the familiar name by which Scott was known to the people in Ettrick Forest. There is abundant evidence that Patrick Shaw and his parishioner of Oakwood Tower did not get on well together. There was constant friction between the two. In March 1614 the laird of Oakwood was, at the instance of the minister, called to account by the Presbytery for profanation of the Sabbath by 'drinking during the time of sermon;' and again in the month of August following, 'for not repairing to the kirk on the afternoon of the Sabbath preceding the Communion,' his excuse being that 'he abode at home, not in contempt of the Word, but because he had to seek out letters to send to Edinburgh on the morrow.' The last time the 'guidman of Oakwood' is referred to in the records of Melrose Presbytery is in the month of June 1618, when, along with the 'guidman of Hartwoodmyers' and George Scott of Castleside, he appears before the assembled brethren and desires the process of excommunication to be stayed against his kinsmen in Newark for the horrible slaughter of Adam Dalgleish in Whithope on the ground that they are penitent.

The House of Sinton was represented in those days by Isobel Douglas, widow of Walter Scott, who, as the Presbytery records show, was of much the same turbulent type as Robert of Oakwood Tower and Walter of Thirlestane. Isobel was the 'guidwyf of Sinton,' whom the Presbytery ordained to be summoned on 4th July 1615 'for abusing of her minister publicly by words and countenance on the Sabbath betwixt the sermons in the audience of the congregation.' In the month of January 1616 there appears the following entry in the records of the Presbytery: 'Compeirit Isobel Douglas, guidwyf of South Sinton; and being chargeit quhy she repairit not to her awin paroch kirk to heir the Word, answerit she would not repair to her kirk all the dayes of her lyf.' It is recorded that 'she haunted for a brief space' the neighbouring kirk of Lilliesleaf, and that when the door there was closed against her by the order of the Presbytery, she betook herself on the Sabbath to the parish of Hassendean for the hearing of the Word. On 19th September 1615 Thomas Wilkie of Lilliesleaf was censured by his brethren 'for admitting the guidwyf of Sinton to the Sacrament of the Supper, she being a contemner of her awen minister and of her awin kirk;' and he was strictly warned that 'should he ever do the lyk again he would be suspendit of his office.' The moderator was at the same time instructed to write to the Presbytery of Jedburgh and acquaint the brethren there with the doings of the minister of Hassendean, how that he encouraged the guidwyf of Sinton to repair to his kirk notwithstanding that he understood she despised her own minister and the Word out of his mouth, and had been advised by them not to receive her in respect of her contempt. Eventually Isobel made ample amends to her minister for her abuse of him, 'which she had done in her passion,' and was readmitted to communion in her own parish kirk, having given a promise to the Presbytery that never

again would she upbraid the minister in the hearing of the people. James Scott was then minister of the Forest Kirk, or St Mary of the Lowes, and the probability is that he was a younger son of one of the families in the district. It cannot be said that Scott was an ideal pastor like the minister of Lindean and Boldside (now the parish of Galashiels), for he is described in the Presbytery records as 'careless and easy-going, as negligent in discipline, in the using of his buik, and in preparing his people for communion.' He was even suspected to be 'ane player at cairdis,' and too fond of 'beiring companie' both at Edinburgh and at home, for which he was called to account by the Presbytery and warned to behave himself better in time coming, else they would proceed against him. When questioned by the Presbytery as to why he did not teach on the Sabbath afternoon, he answered that 'he could not get an auditorie;' and when interrogated as to whether he had a session, he replied, 'He had a session every Sabbath afternoon, but the elders do not frequentlie convein in respect of deadlie feud.'

It was an extensive parish which Scott had to minister to. It included, in addition to Yarrow and Ettrick vales, the whole of Rankleburn and Buccleuch. There had been no minister in Ettrick valley from the time of the Reformation until 1618, when Mr Robert Martin was nominated by the Bishop of Glasgow, and admitted by the Synod, after trial by the Presbytery, to the new kirk of Ettrick. In September 1615 the minister of the Forest Kirk is admonished by the Presbytery, 'in respect of the largeness of his congregation and their ignorance, to be more diligent in examining and catechising his people;' and again, in the month of August 1617, 'he is forbidden to take caution for any faults, but to discipline the offenders, and exact diligently the penalties.' It would appear that for several years at least the minister of St Mary's Kirk did not reside in his parish. He excused his absence on the ground 'that he could not get a place in which to reside.' Both manse and glebe in those days were in the upper part of Yarrow, quite close to St Mary's Loch, on what is now known as the farm of Kirkstead; but the manse, which had been the vicar's house previous to the Reformation, was in Scott's time in such a state of disrepair that no one could live in it. As his non-residence was 'a great impediment to the faithful discharge of his ministrie,' and as 'the minister could not travel weil in winter to his kirk because of storms and waters,' it was deemed advisable 'to speak to my lord of Buccleuch to see whether he will make excambion with the minister of his manse and glebe, or else admit the minister as his tenant; for it is a lamentable thing that the minister should not be resident among his people, and that his life should be endangered, especially in time of winter, while travelling to his kirk.' Nothing came of the negotiations with my lord of Buccleuch. We read in a subsequent minute of the Presbytery that James Scott of St Mary of the Lowes 'is charged by his brethren, seeing his non-residence cannot be mended, to use diligence and to find the nearest roume for remaining among his people.'

Not a vestige now remains of the ancient kirk of the Forest. Where it exactly stood is still a matter of dispute. But the old churchyard remains, an enclosure on a bleak hillside, with no human habitation near, and accessible from the public road only by a steep, rough bridle-path. Within this lonely burying-ground of St Mary of the Lowes, where the bones of innumerable Scotts have been laid, a service is conducted once a year, on the fourth Sunday in July, by the minister of Yarrow parish—a fitting and appropriate tribute to the memory of the past. On that occasion the opening psalm is always that which begins, 'I to the hills will lift mine eyes,' and it is invariably sung to the grand old tune of 'French.' What memories are awakened by the sight of those graves! What thoughts crowd into our mind as we reflect on the past!

> Here, have I thought, 'twere sweet to dwell,
> And rear again the chaplain's cell,
> Like that same peaceful hermitage
> Where Milton long'd to spend his age.
> 'Twere sweet to mark the setting day
> On Bourhope's lonely top decay;
> And, as it faint and feeble died
> On the broad lake and mountain's side,
> To say, 'Thus pleasures fade away,
> Youth, talents, beauty thus decay,
> And leave us dark, forlorn, and gray.'

THE OLD RESIDENT.

A DARK, entangling wood, a shadowed stream—
A tree stupendous, dwarfing all around,
Whose head like morning mountain-top would gleam
Long ere the slanting sunshafts struck the ground;
Whose fadeless boughs, by autumn never browned,
Sheltered the prowling panther and its young—
And in and out the Indian deftly wound
From camp to camp, along the current strong,
Bound for Arcadian meres where fearless fowl did throng.

Crashed on primeval calm the stormy clang
Of hard-swung steel, which down in thunder bore
The giant's comrades all; anon they sprang
On wings of flame, and vanished evermore.
And Nature's face another aspect wore,
And herds and flocks usurped the panther's range,
Homes opulent replaced the camps of yore,
And the dusk rover now finds all things strange,
All strange and new save thee, thou enemy of change!

Green be thy boughs, and sound thy mighty heart,
Steadfast thy roots, deep anchored in the clay;
Withered the arm whose sacrilegious part
Would be to hew thy girdle of decay.
O thou, to whom man's age is but a day!
Oldest of living things, secure from harm
By transient dwellers here be thou for aye;
Be the sole hazards to thine august form
The earthquake's dizzying roll, the lightning, and the storm.

LOUGH NEAGH AND CONEY ISLAND.

IT is a remarkable fact that when, recently, two tragic cases of boating fatality occurred on the treacherous and ever-promising yet seldom faithful waters of Lough Neagh, half the world was in ignorance as to its whereabouts; and yet Lough Neagh is the largest lake in the British Isles. Fifteen miles long and eleven miles broad, it is surrounded by five counties —Antrim, Down, Armagh, Tyrone, and Londonderry—and is in the very heart of the most romantic lands of Ulster—the country of the O'Connors and the O'Neills of ancient and modern days, the scene of centuries of blood and strife, and the changing vicissitudes of these great families.

It was on Lough Neagh, as tradition has it, between Derrywara and St Columkill, past the holy Island of Coney, that the race was run between The O'Connor and The O'Neill for the lordship not only of the shores of Lough Neagh but of the whole of Ulster. All other means of settling disputes and solving the problem of sovereignty having failed, it was agreed that the two disputants should, in their respective galleys, sail from one side of the lough to the other, and that the hand that touched the shore opposite to the starting-point first should be judged the sovereign lord.

Over the storm-tossed waters of the lake, then, sailed The O'Connor and The O'Neill, their dependants, as they went, reciting again the ancient sagas and chanting once more the songs of bygone scalds. As the race proceeded, it was seen that fortune favoured The O'Connor; and as they drew near to the goal his chances of victory seemed certain. But the tables were turned in a tragic and picturesque manner; for, seeing The O'Connor on the point of touching the shore, The O'Neill raised his axe and with one blow severed his own left hand from his arm, and, seizing the dissevered member, flung it over the head of The O'Connor on to the land. The race was for The O'Neill, and this deed, shimmering between history and tradition, is recalled by the fact that the 'Blood-red Hand' is proudly cherished in the heraldic blazonry of the family of O'Neill, still residing, though not as sovereign lords, in the historic castle of Shane's, on the shores of Lough Neagh. Some authorities have it that O'Neill was a Highlander, and that the race took place in the channel dividing Ireland from Scotland between a whole fleet of galleys manned by Celts. The Lough Neagh version of the story is, however, regarded as nearer gospel.

Of the few islands on Lough Neagh, the Island of Coney possesses the most romantic associations, and the mainland, off which it stands, has been probably less affected by civilisation, as far as it is represented by the decay of myth and superstition, than any other spot in the British Isles. For though it is only some five or six miles from a railway station, it is entirely out of the beaten track of commercial and tourist life. The village of Maghery, from which one reaches Coney Island, is quite isolated from the world, and has no importance except to a few fisherfolk and to Lord Charlemont (the owner of Coney) and his friends. To this day the belief in spirits and banshees, in fairies and witches, in curses and invocations, remains fresh and uncorrected by the prose of experience. The present writer was told only the other day by a fisherman at Maghery that he had seen a woman rise out of the water and sail away on a small cloud in the direction of Antrim. A boatman told him that he had seen a strange woman pass down to the ferry at Maghery and suddenly rise in the air and disappear in a mist. Such stories are common enough, and are thoroughly and sincerely believed in. Scepticism is regarded as a form of ignorance or blindness, and is despised as such by people who are conscious of their powers as seers and soothsayers. One cannot help being struck by the attitude of the inhabitants to the outside world in general. They seem to stand aloof, as if in possession of some mysterious power that keeps them free from partaking in the gross disbelief of the stranger who may hail them within their gates. These strangers, indeed, are so rare as to be entirely discounted as a factor in their existence. They chiefly consist of occasional visitors who are to enjoy the hospitality of Lord Charlemont on

[*All Rights Reserved.*]

Coney Island: either the intimate hospitality accorded to personal friends or the general hospitality accorded on occasion to the public. Life moves along in a quaint, old world, dreamy way. The time of day is not regulated by any railway system, nor corrected even by any attempt at stage-coach precision, both of which are only known by hearsay to the majority of the inhabitants. Their talk is of fishing-trawls and the weather, of tokens and manifestations, of fairies and banshees, and of their own domestic records and traditions. Wars and rumours of wars, science and art, sport, and the pleasures of towns have neither meaning nor interest to them, and are mysterious vanities spoken in a foreign tongue. But if you would speak of ancient myth and tradition, treating it as gospel; if you would echo again the sagas and songs of old, you might be able to add not a little to your storehouse of picturesque narrative.

Chiefly they may tell you of the varied history of Coney Island, and recall the times long before the present popular holder of the Charlemont estates had converted it into one of his places of residence. From them we learn that it was a frequent resort of St Patrick, and that at one time it was accessible by road from the Armagh coast. At present it is a mile and a half from the mainland, separated by a changeful and treacherous water. The tradition of the road is backed by the fact that the remains of a road coming down to the lake are found under the heather and bog on the Armagh side, and a wedge of shallow water (except where it has been deepened to admit of boats passing) runs from this towards the island, which still goes by the name of St Patrick's Road. The name of Coney was given to the island at a later date. The generally accepted story is that, some time in the fourteenth century, some hostile clans under the lordship of The O'Neill were advancing from the Derry side to displace the O'Connors, who held possession of the southern coast of Lough Neagh. When they reached Moneymore, Dermot, the chief under whom the O'Neills were advancing, was taken seriously ill. At that time a woman, round whose name many strange and mysterious stories had collected, lived in a lonely cell in the woods of Tyrone, in a district now named Kilconey, forming part of Lord Charlemont's demesne of Drumcairne. Her name was Coney. She seems to have practised the arts of leechcraft and medicine with so much success as to inspire respect and awe in the minds of the natives. The chiefs accompanying the invalided Dermot urged him strongly to send for her and ask her advice; but Coney would only consent to give it on the condition that Dermot was brought to her cell. Thither, then, the O'Neills carried their sickly chief, who submitted to the therapeutic skill of the woman. Whatever was the nature of her success in the past, it need only be stated that in the present case the consequences were of a very effective nature, for after the administration of the first prescription Dermot promptly died! It was not surprising, therefore, that the suspicion of the O'Neills was aroused, and that they openly charged Coney with being a tool in the hands of the O'Connors to rid them of the chief of the O'Neills. The whole clan swore vengeance, which would probably have sooner or later descended upon the active offender if the O'Connors, hearing of the danger in which Coney was placed, had not carried her off and deposited her on the island henceforth to bear her name, and on which she practised her profession for many years. At her death the O'Connors erected a tower to her memory, the ruins of which still remain, and which has been selected as the final resting-place of the present owner of the island. Coney was subsequently beatified by the Pope.

It may be remarked that the Island of Coney at the mouth of New York Harbour was named by emigrants from the district of Maghery after the saint and the island round which their memories lingered.

In the reign of Queen Elizabeth, and again in the Rebellions of 1641 and 1798, Coney Island became a Government penal settlement, and executions took place on a mound that is now used to support the flagstaff on which fly Lord Charlemont's colours.

Of other traditions of Coney is the one held stubbornly by every man within a radius of ten miles of Maghery: that it is the healthiest spot in all the earth. Those who are sick or depressed seek its shores, and return avowing that a miracle has been worked, though at night they give it a wide berth, so that St Coney, the fairies, and the spirits of departed patriots and criminals may enjoy themselves unmolested.

GIANT CIRCUMSTANCE.

CHAPTER X.—THE HAND OF A FRIEND.

GENERAL CARRICK'S lawyers claimed as much of Geoff's spare time as they could capture during the next few days.

When the business had all been got through he found himself a wealthy man and a man with a new name. Uncle Carrick had left him practically the whole of his fortune, on the one sole condition that he should enjoy it under the name to which it had always been attached. To Ellen, seeing that her marriage with Exmoor and the settlements he had proposed would more than amply provide for her, he left a simple two thousand pounds a year, which, as he jovially put it in his will, might come in useful for some of her younger sons. Geoff was

for increasing the amount, but the others would not hear of it.

So Ellen and Charlie were quietly married one fine morning in St George's, Hanover Square, and two hours later were speeding away to the Tyrol.

Geoff was still captive to the slow routine of the law. He had got extended leave, the *Seamew* was chafing her anchor-chains at Gosport, and Bannatyne was counting the hours till he should have a free sea under his counter; but, until the lawyers said the word, Geoff lived in the old house in Portman Square, and chafed at his chains like the *Seamew*.

He went to his club once or twice, and then went no more. He made several calls, but found no pleasure in them. It may have been hypersensitiveness on his part. It is quite possible that what he found was what he feared to find, and that it really existed only in his imagination; but it seemed to him that the atmosphere was a trifle frosty, and his spirit was up in arms at once.

Two matters, however, enlivened this dull interregnum for him and gave him much satisfaction.

He wanted a personal attendant, and bethought him to look up young Tom Brading and offer him a post to which, in the inherent fitness of things, he had some sort of hereditary claim. Old Brading had slipped quietly away, in answer to his final call, a week after Geoff saw him in January. In spite of his father's forebodings, young Tom had pulled through the heat and fevers and flying bullets and whirling blades of the Soudan, with no worse casualties than a smashed shoulder, which was very slow of healing, and a slashed head, of both of which honourable wounds he was not a little proud. Sometime or other he was also to get a medal, if he lived till they were distributed.

So Geoff sought him out, was pleased at the way he jumped at the suggestion, purchased his discharge, and made a good man one of the happiest men on earth. To serve Mr Geoff, as his father had served General Carrick, had been young Brading's highest hope, and happiness comes of the rare realisation of one's ideals. From such a combination comes faithful service.

'I'll serve you, Mr Geoff, as my father served the General,' said he quietly, but with a deep ring in his voice.

'Then I count myself a fortunate man, Tom, for my uncle always said Old Brading was one of the finest men he ever knew.'

And Challis never regretted that little piece of business.

The other matter surprised him somewhat, but gave him very deep pleasure.

When he got home from a protracted sitting with the lawyers one day, old Bourne handed him a card which had been left during his absence:

'The Duke of Saxe-Hohenburg-Eisenach.'

'Left it himself, Mr Geoff, and a very fine old gentleman he is, sir. Seemed kind of disappointed, too, at not finding you in, I thought,' said Bourne, with an evident suggestion that the family prestige would not suffer by the following up of so very desirable an acquaintance.

Geoff had heard from Ellen that the Eisenachs had withdrawn almost entirely from society since their son's death. There was, therefore, in the very fact of the call so plain an intimation of friendliness that he returned it the next day.

The great house still wore that air of sombre melancholy which would never leave it again until it passed into other hands.

He was shown into the same gloomy library; but presently the ancient footman came softly in and begged Geoff to follow him, and, to his surprise, led him upstairs to the very top of the house. There, at the end of a long passage, he tapped on a door, bent to catch the required permission, and quietly ushered him into the room—a great apartment lined with shelves containing bottles, retorts, and glasses of every shape and size, long tables, some similarly crowded, some waiting for their loads, long flexible gas-tubes with Bunsen-burners attached, everywhere the bright June sunshine—an ideal workshop for a student of unlimited means. His Highness was bending over a table at the far end of the room, but straightened up and came to meet his visitor at once, with outstretched hand and a grave smile of welcome.

'I hoped you would come to see me, Mr Challis,' he said. 'Now, may I crave your indulgence for just two minutes. You catch me at work, you see. —Max!'—to a tall young man who had turned from the embrasure of a window as Geoff came in—'Mr Challis will join you in a cigar perhaps. The box is on the mantelpiece there. I shall have done in a moment or two;' and he turned again to the table he had been leaning over, and was instantly absorbed in his work. He took a test-tube from its stand, carefully added a few drops from a bottle, and stood watching it keenly.

'Try one of these, Mr Challis,' said the young man; 'they are quite decent,' and drew him away towards the window out of which he had been looking. Outside was the dappled greenery of the Park, a beneficent blue sky, and soft sunshine. From below came the rumble of passing carriages and omnibuses and the subdued hum of human traffic. In the quiet room behind them the occasional gentle click of glass on glass alone broke the silence.

'In his absorption in more important matters, my uncle has overlooked the usual formalities, Mr Challis. Permit me to supply the deficiency. I am Max of Gunsberg-Gerisau. You had pretty rough times out there in the Soudan?'

And Challis regarded him with new interest, for this was a man of moment in the world just then. He was tall and well built, straight as a pine and very muscular, and carried himself with an air of distinction so assured that he could afford to be perfectly at his ease with it all. His brown hair was clipped to military brevity. His pointed beard and curling moustache were trimmed to a nice exactitude of military precision, and served to enhance

the masterfulness of his bearing. A decidedly handsome man, with a frank, strong face and bold blue eyes which regarded Challis with a look that was at once searching and friendly.

'Yes,' said Geoff; 'the distances and the desert are powerful foes. However, we got there eventually.'

'Much as usual,' smiled the other.

'I'm afraid we can't deny it. Do you think you'd have done it much better?'

'Yes, I think so. With less waste, at all events. Our machine is more highly organised than yours. We've reduced it as nearly as possible to an exact science. You—haven't.'

'We have unbounded faith in Providence, you see—in certain quarters, at all events.'

'Which makes condemnably rough work for those in the field. I prefer the machine built on experience and kept always in good running order.'

'So do I,' said Geoff quietly. 'Faith in one's star is good, but blind faith and leaps in the dark prove costly at times.'

'Ah, ha!' laughed Prince Max. 'So you, too, would urge me to caution, Mr Challis? My good uncle here has done his utmost to dissuade me from it. But the temptation to play kinglet is too strong. It's the chance of a lifetime.'

'It is a great adventure and a bold undertaking. I can at all events wish your Highness every possible success and a safe deliverance.'

'I can't get any one else to see it quite as I see it. Even Bismarck, who has played bolder games and taken greater odds than any man of his time, showed no enthusiasm. He was pleasant about it, but as non-committal as a sphinx.'

'So that, however it turns out, it will be exactly what he expected, and none to say him nay,' said Geoff, with a smile.

'Exactly! Still, it is something—everything, one might say—not to have him in opposition.'

'Yes; he doesn't brook much opposition. If he had thought badly of your chances one would have expected him to put a stop to it.'

''M—yes. The trouble is you never quite know where you are with that very astute old gentleman. He takes long, long views, and we're just pawns in his big games. However, I count on nothing from him but neutrality. If he leaves me free-handed, I'll make or break on the venture.—Well, uncle mine,' as the Grand Duke came to join them with a big pipe in his hand, into which he was thoughtfully ramming tobacco, 'have you settled him?'

'I'm afraid so, my boy. There is undoubtedly cyanide of potassium there.'

'It's a queer pastime, isn't it, Mr Challis,' said Prince Max, 'helping to knit nooses round men's necks?'

'Necks that need nooses should have them,' said Geoff.

'*Jawohl!* That is well said, Mr Challis,' said the old man. 'Besides, this is only an incident in my work. My very good friend Bevil Ray now and again sends me down something to test, without a hint of what I may expect to find. The experiment is absorbing, since I know as a rule that upon our conclusions a man's life may hang.'

'And what happens if you disagree?' asked Max.

'We never disagree,' said the Grand Duke. 'Chemical analysis is an exact science, and Bevil Ray is one of the cleverest analysts of the day.'

'Whereby we imply high compliment to ourselves,' laughed his nephew gaily. 'Well, it's the finest thing in the world to have a hobby and to be able to ride it full stretch.'

'Hobbies are good so long as you ride them on the curb,' said the old man, eying him weightily. 'If you let them run away with you it may end in a cropper.'

'One for me!' laughed Max. 'But there's a certain excitement even in a cropper. I'd sooner have the ride and the cropper than plod the common round all my days. Now, if you will excuse me, uncle, I will run away. I have a large amount of good advice to receive in other quarters, and I want to get through with it and feel myself again. I do hope Aunt Everhilde will soon be better. I will look in again before I go.—Good-bye, Mr Challis. If good fortune ever brings you into Dacia don't fail to knock on my front-door—if they have doors out there. I'm not very sure.'

'When do you mount your hobby, if all the good advice has no effect?' asked the Grand Duke

'In September, if the saddle is ready. Now, I'll trot away to the next dose.'

The Grand Duke pressed a button in the wall and accompanied him to the door.

'He is a fine lad,' he said quietly when he came back, 'but apt to be headstrong. And I do not know that the colonelcy of a Prussian regiment is the best qualification for rulership of a kingdom, even such a kingdom as Dacia.'

'I should say his Highness had many qualifications. He is bold and clear-headed, and his personality will probably grip the imaginations even of the Dacians.

'It will be a very difficult post,' with a doubtful shake of the head. 'There are so many warring interests all round. He is somewhat *entêté* yet with it all, and does not look past the glamour. However, he has chosen his saddle, and he must sit in it. And now, how have things been faring with yourself, my friend? I was very sorry to hear of General Carrick's death. He was a fine old soldier. And your sister is married to Lord Exmoor! It leaves you lonely. What are you thinking of doing yourself?'

'I am somewhat undecided, your Highness'——

'Are you thinking of quitting the army?'

'I have had thoughts of it.'

'Why? Disappointed?'

'Not with the army, nor with myself. I have done my duty as I saw it; but'——

'But due recognition has not followed?'

'Well, rightly or wrongly, I have the feeling that I am hardly likely to get justice there. It is unfor-

tunate, for it takes the heart out of one. Perhaps I have no reason'——

'I think you have, Mr Challis, every reason. I have been watching matters carefully, for I was interested on your account, and I consider the treatment you have had little short of a scandal. I told you things would probably be difficult. Unfortunately you seem to have run up against a unique specimen of pig-head. What would have happened at Tembé had you not broken bounds?'

'We should have lost a few more men, I suppose.'

'You would probably have been wiped out as completely as Hicks was, and you know it. Your action turned the day. Is it true that that woodenhead placed you under arrest?'

'I cannot deny it, your Highness; but he cancelled it afterwards and apologised, so there is no more to be said about it.'

'It is extraordinary what a fool a man can make of himself when he tries his hardest,' said the Grand Duke, puffing thoughtfully at his big pipe. 'But I should think many times before throwing it all up, my boy. You can live it down. Why not exchange?'

'I really think I would sooner quit altogether than exchange. It would feel like turning tail.'

'More so than quitting entirely?'

'Yes, I think so. I would feel it so, anyway. But I am taking a couple of months' leave, and I shall have time to think it all over. Exmoor has lent me his yacht, and I am going up to Norway.'

'Alone?'

'All alone, sir. I want to get away from everything for a time. Then I shall feel more myself again. These last six months have been fairly wasteful.'

'Ay!' said the old man quietly. They had been still more wasteful for him. 'Your trip will do you good, and after the Soudan the northern snows and mists will be refreshing. But I should think many times before giving up the army. You have proved your fitness. Your opportunities will come.'

'Meanwhile, my colonel and I are barely on speaking terms, and the idea of hanging on till more light is vouchsafed him does not greatly attract me.'

'I wonder,' began the Grand Duke thoughtfully, 'if I could not'——

'Pray, don't think of it, your Highness,' Challis broke in hastily. 'I must fight my own battle. I am none the less grateful to you for your thought of me. Did I understand that her Highness is unwell?'

'She has never recovered from our great loss,' said the old man sadly. 'I fear sometimes that she never will. It was a very grievous blow, and her thoughts dwell on it continually.'

'I grieve with you still. And I cannot yet understand why'——

'Ah, that is beyond us. We can only bow and wait. Sometime we shall understand. Must you go?' He touched the button in the wall and accompanied his guest to the door, holding his hand still, as though it were a link with him who was gone.

'Don't decide this matter too hastily, Mr Challis,' he said once more. 'Believe me, life without definite work of some kind is very flavourless, and you are not one, I imagine, to be satisfied with a life of pleasure.'

'No. I will find work of some kind, but it would be rather a satisfaction to be my own man, and subject to no one's humours and caprices.'

'The chance is not given to very many. Once more—don't decide too hastily. I shall be grateful if you will drop in on me occasionally, when you have nothing better to do;' and he shook the hand he held very cordially, and Geoff followed the footman down through the silent house.

(To be continued.)

NEW METHODS OF LIGHTING.

THE metallic showers of incandescent particles thrown off by the sun, acting on our atmosphere, give us the most suitable light for our vision, and all we can ask for in an artificial illuminant is a near copy of it; we can hardly hope to get its healthful and hygienic qualities. When our chemists discover a substance that will store sunlight and be capable of giving it off by radiation the problem will be near solution.

Many substances non-conductors of electricity at ordinary temperatures become good ones when heated. Pencils of lime, magnesia, &c. will allow a current at commercial voltages to pass sufficient to maintain them in a vivid state of incandescence, though when cold their resistance is several hundred times as much; possibly a mixture of the rare earths may give far-reaching results. What is needed is some method, chemical or electrical, of passing by the slow vibrations that characterise radiant heat, and stirring directly vibrations of the frequency corresponding to light. As in waves of sound striking the tympanum with differences of pitch, so the varying wave-lengths of light are sensible to us as colour; the variations from the primary colours—red, yellowish-green, and blue-violet—being due to the reception or reflection of the substance viewed, every opaque object assuming a hue due to the sum of the colours which it reflects; and as artificial illuminants give various colours, articles should be matched by the kind of light they are intended to be viewed in. The vitiation of the atmosphere of living-rooms by artificial light is a matter for serious consideration. A common gas-

burner will alter the chemical composition of the air as much as four persons. Light for light, candles consume more oxygen than oil-lamps and give off more carbonic acid gas; there are also other elements of danger varying with the class of illuminant, whether candles, oil, gas, acetylene, or electric light, which must be taken into consideration, circumstances governing cases. A detached villa standing by itself in the country has Hobson's choice of evils.

The points of economy and efficiency require attention. With the intensely powerful luminants now available, care must be taken not to overdo the lighting and pitch it at too high a key. Visual usefulness is the point to consider. A tallow candle placed where required is better than a misplaced arc light. What are needed for household use are lights of moderate brilliancy and good colour; these, with good judgment in the artistic arrangement for diffusion, will give better effect than double the amount badly arranged. An intelligent use of shaded light gives a sense of repose.

Sunlight, when full, is white, changing to orange-red when near the horizon; acetylene gas gives nearly a white light, ordinary gas and paraffin are yellowish, the incandescent method a yellowish-white, Welsbach mantles a greenish-white, candles orange-yellow; therefore each kind requires a shade to correct its defects, but coloured shades intelligently used are valuable in decorative effect.

The luminosity of clear glass, taken as 100, gives canary as 82; bright-green, 20; ruby, 13; cobalt-blue, barely 4—the last having a very low effect. No brilliant point of light should be left unshaded; it is injurious to the eyesight. Shades should be such as to soften and diffuse the light; it is difficult so to arrange light as to be wholly out of the power of vision, hence the necessity of shading and consequent loss of efficiency.

A yellow-orange tinge gives a warm glow and cheering effect in a room, blue or green a cold, hard hue; therefore, if using, say, a Welsbach mantle, have a rose-pink shade: it is a good selective to absorb the green rays, giving a fairly white light and not a ghastly effect.

Vacuum tubes, where a gas is rendered incandescent by an electric discharge, if improved on, have a future for interior lighting. Possibly a combination of phosphorescent substances may be discovered that will aid artificial illumination. We are a very long way off a perfect light at present.

All the practical illuminants are composed of solid particles, usually carbon, brought to a state of incandescence. In candles, lamps, and ordinary gas, the luminous flames are heated by their own combustion; electric lights and incandescent gas are rendered incandescent by outside means.

A cheap and fairly powerful radiant of low intrinsic brilliancy, capable of modification in delicate colour-tones, is required. The progress at the present time seems to be in the direction of high temperature, implying high intrinsic brilliancy.

In globes for diffusion the drawback is the absolute necessity of always keeping the grooved surfaces perfectly clean, as they collect the dust. A holophane shade causes about 12 per cent. absorption.

Regarding cost, the order is about as follows: candles, animal and vegetable oils, gas in ordinary burners, paraffin, acetylene, Welsbach incandescent; in quality of illumination, regenerative gas-burners and acetylene beat Welsbach by reason of its colour.

The old-fashioned candle, being self-contained, always ready for use, and perfectly mobile, has advantages. Putting the light where it is most useful, and concentrating it only where needed, gives good effect and reduces the cost of illumination. Although candles give a poor light and are expensive, still sixteen of them distributed subdivide the light more efficiently than a sixteen-candle-power lamp would, and look more effective.

Oil-lamps have been used almost from the dawn of civilisation. Sperm, colza, lard, olive, and whale oils, tallow, spermaceti, beeswax, and vegetable waxes, are all rich in carbon, 70 to 80 per cent. Although Pliny mentions a mineral oil in use for lighting, it is practically only within the last half-century, when the American and Russian fields were developed, and the crude, evil-smelling liquid was properly distilled for lighting purposes to render it not too volatile to be dangerous, that the enormous demand has arisen. The lamps are usually designed to give twenty to sixty candle-power; the consumption of oil is about fifty grains per candle-power per hour; and as the oil weighs about 6·6 pounds per gallon, the light is about eight hundred candle-hours per gallon. The open-air lucigen lamps—using the heavier kinds of oil, with compressed heated air-supply, spraying-nozzle, and vaporiser—burn about two gallons an hour, giving a flame three feet high and six or eight inches broad, and are about two thousand candle-power. Commercial arc lamps worked in the open generally run at forty-five to fifty volts and from six to ten ampères.

For scenic purposes, the old-fashioned limelight (oxyhydrogen), the mixed gases impinging on a pencil of lime (that had to be kept in motion), is rapidly being replaced by the electric arc.

Ordinary gas, obtained by the destructive distillation of coal in closed retorts (good coal giving about ten thousand cubic feet per ton of coal), at present is largely diluted with water-gas, which is produced by passing steam through incandescent coal or coke to break it up into hydrogen and oxygen. This is then enriched by admixture with hydrocarbons, thereby acquiring an odour very necessary considering its deadly nature. Air-gas or carburetted air (saturated with hydrocarbon vapour) is convenient under certain circumstances, as in outlying places.

Acetylene gives an intense white light, and is the latest advance in flame illuminants. Volume for volume, it gives the largest commercial yield of light. It is extremely convenient for detached country mansions, but requires proper supervision

and care. The insurance companies' regulations respecting it are stringent. It is prepared from calcic-carbide, a product produced by subjecting a mixture of powdered lime and carbon (coke) to the heat of the electric furnace. The acetylene gas is evolved from this by treating it with water, lime and acetylene resulting. It is a heavy gas, with a strong garlic odour, very rich in carbon, and when burnt as an illuminant, requires a large supply of air for the necessary quantity of oxygen; it is extremely hygroscopic, and as it forms compounds with certain metals, notably copper, this metal should not be used in connection. It is decidedly explosive, and requires careful attention. Its illuminative power is thirty-five to forty-five candle-power per cubic foot—nearly fifteen times that of gas in ordinary burners. A ton of calcic-carbide produces about ten thousand feet of acetylene.

In electric lighting we are still a very, very long way from getting an equivalent to the theoretical value of the coal burnt in the generating plant. Regarding electric lamps, it always pays to use good lamps of as high efficiency as is compatible with proper life, and to *see that you get them.* The life of a lamp depends practically on the temperature at which it is worked, other things being equal.

As regards metal reflectors: metals are exceedingly opaque to light, the velocity in them being in close relation to their electrical conductivity; but at the same time they reflect a large proportion. Highly polished silver is considered the best for reflecting purposes, and is therefore used as a facing for commoner metals.

There is an immense field open to the inventor to improve on the present forms available, or give us a new method of artificial illumination.

A STORY OF THE BASQUE COUNTRY.

CHAPTER II.

ASTILY laying down his rod in the deep shadow where cliff and shingle met, confident that it would there escape notice, and slinging his basket round to his back, where it would be least likely to embarrass his movements—for he dared not leave it below—Foster took his courage in both hands, as the French say, and began the difficult ascent.

After the first few feet, however, he was glad to discover that it became easier than his hasty and imperfect inspection from below had led him to expect, and he was able to climb on until, some fifty feet or so above the river, he came upon a narrow ledge or shelf. Here his progress was stopped, for from this point upwards—how far it was impossible for him to tell—the cliff rose smooth and perpendicular, if not, as he almost fancied, overhanging. But he felt that he might now consider himself quite out of range of any inquisitive eyes; so, slipping off his basket with a sigh of relief, he lay down at full length in comfort and fancied security, and congratulating himself on his escape from an awkward predicament, peered carefully over into the gloomy depths from which he had so successfully emerged.

He found that he could just distinguish the lighter-coloured strip of shingle from its dark surroundings, and that from his elevated position the sounds made by the advancing men were becoming distinctly more audible. The deep Basque oaths and hoarse exclamations, as one or other slipped on the smooth boulders or splashed into a deeper hole than usual, left no doubt in his mind as to the character of the midnight wanderers; and presently a thrill of excitement, if not quite of fear, ran through him as first one black figure, and then another, and yet another stepped on to the gray patch below him, followed by so many more that he could easily have imagined that he was looking down upon an immense domino, a double-six at the very least.

Their proceedings caused him much uneasiness. Instead of continuing their difficult route as he had expected, they one and all, with carefully shaded match, lit up the rubbishy little cigarettes which the foreigner so constantly and yet so badly rolls, and without which few of them can exist for more than ten consecutive minutes. They squatted about, puffing complacently and talking in low tones, but every now and then an upward glance, accompanied by a gesture of the hand in the direction of the hidden fisherman, caused the latter no little perturbation of spirit and much speculation as to its *raison d'être.*

'I wish they would go on,' he muttered. 'It must be awfully late, and Nellie will be alarmed if I don't turn up presently. As it is, I sha'n't be home until long past midnight, and that's a good deal later than I have ever been before. Bother the fellows! when are they going to make a move?'

The question had hardly left his lips than it was answered. The smugglers, if such they were, rose with one accord to their feet, and proceeding to take off their coats, piled them in little heaps here and there. Then one, a great strapping ruffian, strode, to the watcher's intense surprise and consternation, to the base of the cliff, and began to climb it exactly in the same place and in the same careful manner as the latter had just done.

Another prepared to follow, and it became perfectly evident to Foster that he had but a few short minutes ere the whole crew would be upon him!

Here was a pretty kettle of fish! Unpleasant as it would have been to encounter the men below, to be discovered in his present position was

ten times worse. In the first case, his occupation and the wherefore of his presence would have been perfectly self-evident. Whereas now—— Well, there was no saying what would happen; and how explain his reasons for being upon the ledge? He had no doubt whatever that he had stumbled—unwittingly, it is true—upon a dangerous secret, and that the shelf on which he lay, and which had at first appeared such a desirable haven of refuge, was the store-place, or, what was more likely, led to the store-place, wherein were hidden the smuggled goods that the gang had now come to fetch down to their homes in the village.

On first reaching his sanctuary he had been quite content, and had not dreamed of exploring it either way. He must at once repair the omission. There might be a chance of escape yet.

These thoughts, though long in the telling, had flashed through his brain the moment that he saw the men begin their upward movement, and he at once acted upon them while there was yet time. Raising himself cautiously into a crouching position, he proceeded to creep along the ledge towards its lower end; but after a few yards he saw that it was rapidly getting narrower, and was hardly astonished when, a little farther on, it dwindled away to nothing. He had expected as much. Quickly retracing his steps, he made in the other direction, and presently came to the mouth of a low cave which appeared to run back far into the heart of the rock. With a sinking heart he passed the opening, which told its own tale, and found, as he had expected, that at this end also the ledge came to an abrupt stop. There was no doubt about it now: he was cornered, fairly caught in a very tight place.

However, when all was considered, he said to himself he might be alarming himself unnecessarily. He was no *douanier*, no spy, not even a Frenchman. Surely the smugglers would understand that he took no interest in their operations, and that they might indulge in their little amusements until doomsday, as far as he was concerned, without fear of his divulging his discovery. But would they? Although he had unwillingly become possessed of their secret, would they trust him to keep silence? he wondered. A moment more would decide, and his heart began to beat with an unwonted and excusable rapidity when, silhouetted against the sky, the leader's head came slowly into view as he drew himself up above the edge.

When first Foster had passed the mouth of the cave, the natural impulse had been to go into it; but on second thoughts he had resisted the temptation. He felt sure that it would have no other means of access, or the smugglers would not have taken their present laborious path. It, therefore, would do him no good, and might enrage the men. The less he knew about their hoards the better chance he had of propitiating them. So he leaned up against the cliff, a strange figure in his long waders, and quietly awaited the unpleasant moment of his discovery. This, however, was not to be immediately, for the first man up waited to give a helping hand to the second, who in his turn helped the next, and there must have been half-a-dozen of them at least congregated on the ledge before they began to make a move in the direction of the cave's mouth. Suddenly their leader caught sight of the odd and unexpected apparition in front of him, and halted in fear and amazement, then with a muffled curse turned and fled, knocking down the man behind him and throwing the others into confusion; and I verily believe the whole crew of them would have fallen over the edge in their panic, and probably broken their necks in their mad flight from that most terrible of all things, the 'unknown,' had not one of them, sharper or more quick-sighted than the rest, recognised the tell-tale waders, and with a loud cry of '*C'est l'Anglais*,' stopped the rush and halted his frightened companions just in the nick of time.

'*Oui, c'est moi, messieurs*,' was all that Foster found time to say as he stepped forward; the next moment he was roughly seized and violently pushed through the opening behind him.

Inside all was dark. 'Put up the curtain,' growled a voice, adding after a moment's interval, 'and now show a light;' and in quick obedience to the latter order a lantern was immediately uncovered. By its feeble light Foster perceived that he stood in the midst of a band of some dozen scowling peasants, whose numbers were being constantly augmented by others as they made their way into the cave.

He was relieved, however, to notice amongst them several from the village with whom he had more than a nodding acquaintance; but these appeared to be somewhat ill at ease and anxious to avoid his would-be friendly gaze. Indeed, the majority of the men seemed more uncomfortable than really angry; and, auguring well from these signs, their prisoner began to hope that the matter was nothing very serious after all.

The cavern in which he found himself was low and dry, its symmetrical shape showing that it had been cut out of the rock by the agency of man, probably for the express purpose for which it was now used. And what that purpose was it required no expert to discover: the neat packages of Spanish tobacco, and long cylindrical tin cases—*bidons*, as they are called—of cheap and potent potato-spirit, made in Germany and passed through Iberian ports, telling their own tale. He had, as he had all along feared, stumbled on to an important smugglers' *cache*. A heavy blanket hung over the entrance, thus preventing the smallest glimmer of light from showing outside which possibly might attract the attention of any roving *douaniers* on the other side of the gorge. But this was an unlikely contingency. The opposite cliff was so close and of such a height that even had a ray or two of light escaped, it could hardly have been seen by anybody though he stood close to the rugged edge.

It was a most secure retreat, and no doubt had served the smugglers for many a generation.

While Foster was taking in these details the men were discussing the unusual situation in low but excited tones. Although they spoke in the barbarous Basque tongue, which bears no similarity to any known language whatever, and of which, of course, their prisoner understood not a word, he could see by their manner and gesticulations that there was some serious difference of opinion between them.

The men that he knew were evidently all of the same mind, but they were in a decided minority; the others, amongst whom was the big man, who appeared to be the leader of the gang and a man of a much superior class to the rest, outnumbering them by nearly two to one.

Foster tried once or twice to speak, but was sternly told to be silent; and, seeing that he could do nothing to help himself at this stage of the proceedings, he wisely obeyed and held his tongue, contenting himself for the present with keeping a watchful eye on the disputants. Presently the argument grew more and more animated, the two parties drawing away from each other and apparently getting ready to settle the question by an appeal to arms—for Foster saw more than one sinewy brown hand steal to red worsted waistband where nestled the deadly *navaja*, or Spanish knife, without which no Basque stirs abroad, and passion was fast rising to boiling-point—when the captain, although he belonged to the majority, suddenly appeared to give way, and in a moment everybody had calmed down; and the leader, turning towards the relieved Foster, addressed him in the following words:

'Englishman,' he said, in French of course, 'it does not need any explanation from you as to why you are here to-night. We know your mad fishing habits, and we acquit you of any intention of interfering in what does not concern you in the least. If you had stayed below—where we have found your rod, one of my men tells me—we should not have bothered our heads about you beyond telling you to go home and keep your mouth shut. But you foolishly chose to climb up here and discover our secret, and thus you not only hold us all at your mercy should you inform the *douaniers* of what you have seen to-night, but even if you refrained from doing so we could never again use the cave with the same feelings of security as we and our fathers and our grandfathers have hitherto done. In this trade we dare not take any outside risks; we have enough to do with our legitimate opponents. Dead men tell no tales; and, could I have my way, I tell you frankly that your body would be found in the river to-morrow, "drowned while fishing alone at night:" such would be the verdict. But it appears that many of my men know you, and that you and your wife have done the children many kindnesses; consequently they will not agree to your death. They are foolish, but as I desire no divisions amongst us, I have given in to them against my better judgment, and have decided to keep you a prisoner for a day or two until we can safely remove the contents of this cave to the village, which was the object of our expedition to-night. The time lost, however, thanks to you, has now made this impossible. Dawn will be here too quickly for our work, and we must therefore wait for another favourable opportunity. When this may occur I do not know; our movements depend on those of our friend the enemy. It would not, however, be safe to keep you here; there will be a search for you presently, and if this cave should be discovered we do not want you to be found in it, for you would be compelled to divulge all you know. I would let you go to-night on certain conditions, only I am afraid that the search may have already commenced, for it is very late, and you might be encountered too near here to be safe. I have, therefore, decided to put you into other quarters, where situated only I and two others know; but we have given our words to those opposed to your death that we will do you no harm, and will liberate you on the first opportunity. But you must swear to us, not on the Sacred Book, but on your word as an English gentleman—which I know will bind you—that you will, when you return, make out some excellent excuse for your absence to the officials who will question you, and then leave the country immediately. Quick. We have little time; will you swear, or will you swim?'

Foster grasped the situation at once. Unpleasant as the prospect of imprisonment was, he knew that these wild folk would not hesitate to drown him should he refuse the terms they offered. So, facing the men boldly and holding his head high, he answered in quiet but firm tones:

'As you justly say, I am quite innocent of any intention of prying into your secrets, and I regret as much as you do the ill chance that brought me here to-night. I recognise the difficulties of your position, and assent to your proposals, only asking one boon. Find means, I beg of you, to let my wife know—without any danger to yourselves—that I am safe, and will return unharmed in a day or two. Think of your own womenfolk, and grant it.'

These manly words and the manner of their delivery at once made a good impression on the band. A general murmur of assent rose from the crowd, and the captain, seeing how the land lay, after a moment's hesitation curtly nodded his head. 'It shall be done,' he cried. 'Now promise, and we will move at once.'

'I promise on my word as an Englishman,' solemnly announced Foster, and with relief clearly depicted on most of the swarthy faces, and many a muttered '*Bien*,' the men, at a word from their leader, quietly lifted a corner of the blanket, and one by one stole out in their noiseless rope-soled shoes, and silently disappeared into the night.

The captain and two of his men remained behind; and presently one of the latter slipped away also, and returning after a short absence, said something

to the other two evidently of a satisfactory nature, for, turning to Foster, the chief at once said that they were ready to conduct him to his new quarters.

'As they are farther up the river,' he continued, 'and we shall have to go down the way we came up, the descent (if we are compelled to tie your hands) will be not only very painful to you but exceeding onerous to us. Therefore, if you will give me your word not to attempt to escape we need not resort to any such unpleasant measures, and I am sure that, as you seem to fully realise your position, you will not hesitate to do as I ask.'

The man's remarks were so obviously true that Foster had no choice but to agree. So he gave his promise, and the lantern being covered with its dark cloth, and the blanket taken down, the little party proceeded to follow the others, and with considerable difficulty on Foster's part, handicapped as he was by his waders, they accomplished the descent in safety, finding themselves on the strip of shingle safe and with whole skins.

With a sign to his prisoner to follow, the captain led the way along the river-bed up-stream where Foster had hitherto considered it was quite impossible to pass. The road they took, indeed, quite justified this belief, for by nobody but the initiated could it ever have been successfully negotiated even in daylight. But his guards were not to be denied; and with one dragging him and another pushing, scrambling and crawling now up to his waist in water, now poised on the sharp edge of a huge rock, they slowly made their way along until, after some two or three hundred yards of this trying work, they reached a strip of gravel similar to but smaller than the first one. The river was now at its lowest summer level, and lay in still, deep, rocky pools divided by short lengths of shallow, with now and again a small waterfall where the stream tumbled merrily. It was all very pretty now, doubtless; but Foster saw that in winter or when the river was in flood, the narrow chasm—for at this point the gorge was nothing else, with its lofty perpendicular sides—must become a very maelstrom of tearing waters, quite irresistible in their mighty rush. Above the gravel strip there was such a deep pool that it was evident they had perforce come to the end of their journey; and Foster, looking at the apparent *impasse*, speculated as to what would be his captors' next move.

He was not long left in doubt.

Suddenly, without the least warning, they all three threw themselves upon him, and getting him down easily owing to the unexpectedness of the attack, they quickly and cleverly tied him up like a trussed fowl with the long red worsted sashes they wore. So astonished was their victim that he quite forgot to make a struggle, futile though it would have been against such odds, and he lay quite still, lost in amazement, and wondering what was going to happen next. But the proceedings of the precious trio speedily brought him back from his dreams, causing his heart to thump against his ribs and filling him with feelings of very real alarm. Lighting the lantern, which the leader had brought with him, the ruffian held it aloft against the smooth, water-worn cliff, disclosing by its dim light a small opening in the rock slightly above his head. It looked little more than a wide crack, hardly bigger, in fact, than a good-sized fox's earth; yet this was to be poor Foster's new prison. It looked more fitted for a sepulchre.

As the captain pointed this dreadful hole out to him, he smilingly remarked that it would be a nice and cool place for the Anglais to pass the hot day in. 'And you will not be troubled with visitors either,' the brute mockingly continued, 'for the most reckless *douanier* or gendarme could never penetrate so far as this up the gorge. And besides,' he added, 'as, when you are packed into it, your face will be within a few inches of the roof, any cries for help that you may be tempted to utter will be so softened and tempered in their passage to the air that they will mingle nicely with the babble of the water as it falls over the little cascade above.'

Then, picking him up, they hoisted him into the air, and putting his head into the opening, pushed him up into it as cheerfully as they would have rammed a conical shell into the muzzle of an eighty-one-ton gun.

(To be continued.)

NOTES FROM THE DIARY OF A LONDON MERCHANT.

PART II.

LITIGATION MORE COSTLY TO-DAY.

I DON'T think it is realised how much more costly litigation is nowadays in consequence of the shorter hours of the sittings, the very leisurely way in which the proceedings are conducted, and the often intolerable length of the judge's summing-up. I have had a very large experience of juries, having been liable for special juries both in the City and at Westminster for many years. In the old days we sat from 9.45 till 5 or half-past 5 if necessary to finish a case, with only half-an-hour for lunch. Now the hours are 10.30 (11 on Monday) to 4 sharp, with, I think, a full half-hour for lunch. I have a delightful memory of the pointed and terse summing-up of many of the old judges. My impression is that in later times—I can give some instances in my own time—the judges

are such very clever men that they think the jury are, comparatively speaking, fools; and so the judge labours away through the whole case so that the jury may give a verdict in accordance with *his* opinion, *theirs* being of little value.

There is a point, too, about special juries. Formerly these juries really consisted of merchants and bankers—no, I withdraw the 'bankers:' I have heard them called, but I don't think they ever answered; but the jurymen were good men, merchants and men of business. Lord Coleridge when Attorney-General altered that. By his Act of Parliament, intelligence and business knowledge are assumed to vary in direct ratio with rateable value. So one meets on special juries one or two men who have to try an important mercantile case and yet don't know what a bill of lading is. This has occurred in my own experience.

INSURANCE DIRECTORS BEATEN.

A good many years ago I had a policy in a certain mutual life office. A wealthy old gentleman who was a policy-holder had given notice of a motion at the annual meeting to considerably increase the remuneration of the directors. I determined to prevent this. I first applied to a prominent banker, whose father had been one of the founders of the company. He was entirely with me, he said, but he could do nothing to help me, as he had relinquished his policy. I then applied to the son of another of the founders, whom I knew very well. He also wished me success, but asked me if I was going to canvass for support. I replied, 'Certainly not.' He then said I had no chance of success, and that he could not associate himself with such a forlorn hope. All he would do was to promise to attend the meeting. The day came, and I found the room crowded with supporters of the directors, as my friend said it would be. The appearance of these well-to-do gentlemen led me to suppose that a small percentage, more or less, on their policies was of no consequence to *them*. I saw at once that if I moved a direct negative to the motion there was no chance for me; but I determined, all the same, to defeat it.

When the adoption of the report was moved I rose, and in answer to calls for 'name,' I gave my name, said that I was personally known to most of the directors, and that I should not detain the meeting many minutes. I should say that I am a practised and a fluent speaker, and have a good memory, especially for figures, so that I scarcely use notes. My remarks were to this effect: that economy of management was one of the fundamental features of the society; and although I did not complain of the ratio of expenses, I gave the ratio of some four or five other societies to five figures of decimals, and compared them with this society, and then concluded by saying that if the proposal to increase the remuneration of the directors were carried, the ratio of expenses would be increased by such and such a decimal.

When the old gentleman rose later on to move his proposal he gave himself away by saying that he was afraid I had taken the wind out of his sails, and that when he gave notice of his proposal he supposed it would be adopted unanimously. My business was done. I had no need to say a word more.

There were a good many speeches; even my friend spoke out; and ultimately there was a wrangle, as the directors persisted in the proposal though their friends urged them to withdraw it. They were handsomely beaten, and thus I have been the means of saving many thousands of pounds to the policy-holders.

A CORNISH MINING SWINDLE.

One of the most ludicrous and extraordinary swindles ever perpetrated in Cornish mining occurred a good many years ago. A certain very clever gentleman, finding that he must stop payment, converted himself into a limited company and went into liquidation. The assets consisted mainly or in part of three Cornish mines. One was a large, old mine, the others not of much importance. The large mine had been worked by a good company many years before, and was only closed when they had taken all the copper out of it. There was nothing left but arsenic, and for this article it had been subsequently worked with unimportant results.

This mine no longer belonged to the clever gentleman, whom we will call Mr X.; it was, of course, in the hands of the liquidator of the X. limited company. But Mr X. registered three companies for the three mines, all with the same directors, who were merely clerks of no position whatever, and began operations. These companies *never had the mines in their possession;* but the liquidator had an understanding with Mr X. by which they could have them upon payment of such a sum or sums of money.

One good man in the Channel Islands took two thousand one pound shares. The balance of the shares were allotted to Mr X. and one or two others, neither his nor their names appearing anywhere except in the list of shareholders. The directors held the statutory one share each and no more.

The first step was to pay a dividend of 2½ per cent. a month, and then open an office in London for the sale of the shares at a premium. Of course it took little money at first to pay the dividend, because the only *bonâ-fide* allotment was that of the two thousand shares. I could never find out whether this gentleman was ultimately in the swim. I am sure that at first he went in innocently. Incredible as it may seem, the shares began to find buyers—chiefly widows, governesses, and other persons of limited income, and clergymen. As the shares were placed they were transferred from the blocks in the names of X. and the others. For a few months things went merrily, and meetings of each

company were held on the mines, at which no outsider was present. The shares were issued to bearer, and by the articles of association holders of shares to bearer were not allowed to attend the meetings! The reports presented at the meetings, giving the results of four months' working, were of a very rosy character. This result was arrived at by a very simple method, for Mr X. was a genius. A great part of the outlay was charged to 'Development Account,' whilst the receipts were put to the credit of revenue.

Being so much connected with Cornwall and arsenic, I knew what a swindle this was, and was seeking advice as to the course I ought to take, when my attention was called to the fact that the *London Figaro* had written of these wonderful companies, and had asked for information concerning them. I therefore wrote to the editor, suggesting an interview. The manager called upon me, and we agreed upon a plan, which we pledged ourselves to pursue till we had put an end to this swindle and to Mr X. I was to write letters, as from various persons, giving information, and a barrister was to write leading articles from time to time, based upon these letters. We had no communication with each other, and I don't think he knew my name till afterwards.

It was really a capital amusement. Some of my letters were written by a Mr Ezra Buggins, supposed to reside in Cornwall, but occasionally in London, when he would visit Somerset House and inspect the share registers. I thought this name a good one, and over this signature I furnished a large amount of genuine information. I also 'wrote sarcastic.' As a poor parson I wrote from Newcastle blaming the editor for attacking these companies, and saying 'how useful the monthly dividends were, with my large family.' I added that Mr Buggins had pointed out that the accounts were not audited; but it was due to the economical management that the company was able to pay the monthly dividend. If there were an auditor there might be no dividend.

Mr X.'s policy had been to coax the editor of the *Figaro* to leave him alone; and with reference to the poor parson's letter, he wrote to the editor to tell him that his correspondents were imposing on him, as they had no shareholder at Newcastle who was a clergyman. Some genuine letters came to hand from Cornwall, and were inserted. This went on for some time, till Mr X. felt he must give in. He then sent a very lengthy document to the editor; said, curiously enough, that he felt sure I was at the back of it; and threatened an action for libel unless the charges were withdrawn and an apology inserted. After consulting me, the *Figaro* had a *very* strong article, recapitulating all the charges, and expressing their readiness to meet Mr X. in any court of law. This finished the companies. I heard a sad tale of poor women applying for dividends, and coming away from the office in tears.

FRENCH GREASE-RECOVERY PROCESS.

At the time of Napoleon's *coup d'état* two French gentlemen found it desirable to flee and take refuge in England. They were not Parisians, but they were men of some importance in the provinces, one being a mayor. They had invented a process for recovering the grease from the washings of woollen-mills. As these Frenchmen had good introductions, they found no difficulty in meeting with a private gentleman who found the money first to try and then to work the process, which was a simple one. The business was established in Yorkshire, the Frenchmen attending to the manufacture, and the business being managed by a gentleman sent down from London by the capitalist to look after his interest. This gentleman, as it happened, was a friend of mine.

The business was a paying one. I believe the washings, which had hitherto been allowed to run away, were at first obtained without payment, being brought to the works in large barrels on wheels, like water-carts. I have seen long strings of these carts coming into the works, where the washings were tilted into tanks. The washings contained not only the grease washed out of the wool, but the grease and fatty matter in the soap used in scouring the wool. After some time the Frenchmen had notice from their friends that they might safely return to France, and they hastily departed with great glee, especially at the prospect of rejoining their families. Strange to say, they were not heard of again! The capitalist afterwards sold the business, and it was worked on an extensive scale. Miles upon miles of piping were laid down, which brought the washings from the different mills into the works. The washings, however, had to be paid for, and became a considerable source of revenue to the mills. My friend the manager was retained by the new firm, and I bought from time to time hundreds of tons of the recovered grease, finding a ready market for it in Germany.

Petroleum and the consequent reduction in price of oils, tallow, &c., ultimately knocked this business on the head.

One of my visits to Yorkshire on this business took place at the time of a war between the Great Northern (not long opened) and the London and North-Western Railways. I travelled to Leeds first class for five shillings.

BOGUS SHIPMENT OF COTTON FROM INDIA.

A London firm with a capital of ten thousand pounds, which had not been long established, was doing a considerable business with a native house at Bombay when the Mutiny of 1857 occurred. There were considerable quantities of cotton, here and afloat, shipped from Bombay on consignment, on which the London firm had made advances. This cotton they held all through the crisis, and thus saved the Bombay house a heavy loss.

The native gentlemen expressed the most lively

gratitude, and asked for the portraits of the partners in the London firm. One of the partners had a hare-lip, and the other was rather insignificant in appearance, and they asked me what they should do. I suggested that they should send out a good portrait of Lord Palmerston and one of the Lord Derby of that day. What they did I know not.

The business went on some time longer, cotton being continuously shipped by sailing-vessels. At last one of these shipments, upon being landed at the docks, was found to consist of bales made up with some cotton outside, but only stones and rubbish in the interior. Following shipments were similar; and, in fact, a total amount of twenty thousand pounds had been advanced by acceptances against shipments of this character, the value of which was, of course, comparatively trifling. The banks who held the bills admitted that there had been laxity on the part of their Bombay managers, and the whole matter was amicably compromised. Every effort was made to find the partners in the native house, but in vain. They had gone up-country, where their identity was lost. One result followed, I believe. The Indian Government appointed inspectors to examine the parcels of cotton before shipment, so that a similar swindle should be impossible in future.

JURYMEN.

Every experienced juryman has sat in cases where the judge has done his best to impress the jury with *his* view of the way the verdict ought to go. Lord Coleridge sometimes adopted this method, and in such cases he was almost imperative. With the air of a superior person, and with a blandness which rarely forsook him, he impressed the jury with the idea that they, as men of intelligence, must take the same view as he, as a man of superior intelligence, took.

I was one of the jury in a case tried at the Guildhall before Chief-Justice Coleridge and a special jury. A young woman standing in Cheapside to view the Lord Mayor's Show was hurt, through one of the horses of a common councilman's carriage becoming restive and treading on her foot. We learnt that the job-master who horsed a large number of these carriages undertook to supply horses that would be quiet under all circumstances, and that he was liable for any damage that might arise through an accident. It was explained that this particular horse was perfectly quiet; but it so happened that the bells of Bow Church and a military band both broke out at the same moment, and the most thoroughly broken horse could not be expected to stand that.

The case was simple enough. The facts were not disputed. The plaintiff was hardly cross-examined; and, most important of all, counsel for the defendant only addressed the jury on the question of damages, asking them to give only moderate and reasonable damages. Notwithstanding this, the judge most emphatically summed up against the young woman. When the jury retired we found ten were in favour of the plaintiff and two against her. In all such cases I have found it the best way to ask the minority to give their reasons. In this case they said that the judge so evidently wanted the jury to give a verdict against the plaintiff that they did not like to go against him. To this the ten replied that it was for the jury, not for the judge, to give the verdict; and as ten were for the plaintiff they were probably right. The two did not dispute this, and we agreed upon a verdict for the plaintiff with forty pounds damages. Now comes the fun.

In the chief court at the Guildhall a short staircase led direct from the jury-box to their retiring-room. When we informed the usher that we had agreed upon our verdict, we found another jury in the box; but the judge and counsel in the next case were entirely absorbed in a discussion, and the jury had not been sworn. The usher, therefore, turned them out of the box and put us in. The discussion terminated in a settlement; and it was agreed that a certain verdict was to be given by the jury. The jury must be sworn, said the judge. We were sworn, gave the verdict agreed upon, and pocketed a guinea apiece, much to the disgust of the jurymen who had been turned out of the box. As we stayed in the box the judge said, 'You can go, gentlemen.' When we explained that we were the jury in the preceding case, and gave our verdict for the plaintiff, blandness entirely forsook the countenance of the judge but spread over the countenances of the jury as each one pocketed a second guinea. That is not all. As I went off to lunch with another juryman a gentleman ran after us. He said that he was defendant, and although it was irregular to speak to us, he wished to *thank us* for our verdict, because forty pounds was the exact sum he had offered the plaintiff! The litigation had arisen solely through her solicitor.

ABOUT ARSENIC.

When the Franco-German war broke out we had contracts running with different chemical works on the Rhine for a total quantity of between one thousand five hundred and two thousand tons of arsenic. As these contracts were all made c.i.f. Antwerp, there was no difficulty whatever in carrying them out, as far as we were concerned. The buyers, however, as they were unable to continue their business during the war, simply advised us not to ship the arsenic, as they could not receive it during the continuance of the war.

One great inconvenience, and the chief expense to us, was that we had to find and to rent warehouses at Plymouth and elsewhere to store the arsenic. At that time there was no storage at the mine where the arsenic was produced, and we practically had to take it away as it was made. Our buyers refused to compensate us for these expenses, loss of interest, &c., and we did not care to have lawsuits with them in the German courts. They did not repudiate the contracts, but readily took the arsenic when the

war was over. After the war I visited these buyers, hoping to induce them to let us ship some arsenic at once. They were anxious to have it, but they would not take the risk of getting it to their works. Everything was so disorganised by the war, they said. If we would deliver it to their works they would be glad to have it, and would pay the cost of transport from Antwerp. I then went to a capital firm at Bâle who undertook all kinds of forwarding business, and arranged with them to ship three hundred tons of arsenic to Antwerp, which they would take charge of and send by steamer through the canal and up the river, delivering one hundred tons each to three of our buyers.

The German Government and the German police were always making trouble about arsenic, especially when it was in single barrels only. At that time they did not interfere so long as it was being conveyed by water; but as soon as it touched land they could stop it, and either impose a fine or compel you to case it. Of course, if they got wind of its going up the river they would be on the watch, and interfere with the landing.

I therefore arranged with the forwarding agents that the steamer taking the arsenic should carry also a sufficient quantity of bales of cotton to completely conceal the arsenic, and by this means we successfully ran the blockade and safely delivered one hundred tons to each of the three works. It was, however, a very narrow shave. The police got to hear of it, and in less than an hour after the last hundred tons had been delivered at the works they appeared on the scene, wanting to know all about it, and threatening proceedings. Of course they could *do* nothing, as they had not caught the arsenic *in transit*.

AN UNEQUAL FIGHT.

A large parcel of chrome ore which had belonged to a company in liquidation was in our hands, and we had given the offer of it to a London colour manufacturer, who was engaged in trying some experiments with it. Meanwhile the secretary to the company came to us with a telegram in his hand, saying that he could take the parcel at a certain price. As our buyer could not yet decide, and as he said he could not ask us to hold it longer for him, we accepted the offer of the secretary, and the ore was shipped to Glasgow, where his buyers carried on business. These buyers, who were very rich, at once remitted a large part of the amount, but kept back some three hundred pounds, which the poor secretary was unable to get, though the grounds of their refusal to pay were rather vague. The secretary was worried about this, and feared very much having to sue them in Scotland; so we told him to tell his solicitor that we always owed the Glasgow manufacturers money. We were buying from them every week. The solicitor consequently attached the money we owed in the Lord Mayor's Court, as this would cause the case to be tried in London; and the secretary forthwith began his action against the Glasgow manufacturers.

As the proceedings went on it appeared that the Glasgow people were refusing to pay because they thought the secretary was a gentleman who had been with us, and had been formerly to see them on our behalf, and so they chose to assume that we had combined to make them pay more than they need have done, and they determined to see if they could not get some reduction in the price. They had simply found a mare's nest. The secretary and our agent were two distinct gentlemen, having nothing whatever in common excepting their surname, and they had never even met.

The case came on for trial at the Guildhall before Sir A. Cockburn. On the morning of the trial Sir G. Honeyman, who led for the plaintiff, said he had been reading his brief, and it seemed to him Sir A. Cockburn would take a strong view against the plaintiff. A consultation was held, and I suggested that Sir George should be requested to keep out of the way, and that the conduct of the case should be left to the junior counsel, Mr W. G. Harrison, afterwards Q.C. This course was adopted.

The first witness was the plaintiff, and a very bad witness he was. He was very nervous, constantly on the move, and the defendant's counsel worried him till he hardly knew what he said. Sir A. Cockburn evidently became strongly prejudiced against his case. It came out that one point of the defendant's case was that they were the *only* buyers, and that, knowing this, we had combined with the plaintiff against them. As soon as this came out I took a cab and brought our other buyer to the court. He was a gentleman of position, and was put in the box at once. He stated that he had not only been in treaty for the ore, but having completed his trials, he was now ready to buy the whole parcel, and at a higher price than the Glasgow people had paid for it. This completely demolished one important point of the defence.

When my turn came to enter the witness-box Serjeant Parry was sent for, and sat facing me with his eyes fixed upon me. We had heard through counsel that he was briefed with fifty guineas. Simply to cross-examine me! Other counsel had conducted the case. My evidence was simple enough, and showed that there was no mystery in the case. It had a surprising influence on Sir A. Cockburn, who evidently came round to the side of the plaintiff. After my examination-in-chief he put some questions to me quite in a conversational way, to have everything quite clear, and then said, 'Brother Parry, have you any evidence to contradict this gentleman? Because if not, I don't see what defence you have.' After a hurried few words with his clients the Serjeant said, 'My lord, if the defendants had known what the evidence of this witness would have been they would not have contested the case.' He asked me one question, *sotto voce*, 'Have you the invoice from the liquidator with you?' 'Yes,' I said, 'receipted;' and I handed it to him for his inspec-

tion; but he scarcely looked at it. He felt bound to do something for the fifty guineas. Some of the jury said they thought it was a most unjustifiable attempt on the part of the Glasgow people to get out of a bargain they had entered into; but Sir A. Cockburn, smiling, said, 'Gentlemen, you must not say anything.' He also warmly complimented Mr Harrison upon the way in which he had conducted the case.

Three points I should mention:

(1) The defendants absolutely knew beforehand what my evidence would be, because *they had seen the draft of it;* the plaintiff's solicitor, to avoid litigation, having asked my permission to send it to them. They little thought that the judge and Serjeant Parry would accept it without question.

(2) There was one point which I thought might be raised, and which I preferred to bring out myself, and I did this by way of an addition to or explanation of one of my answers in my examination-in-chief. Mr Harrison told me afterwards he thought I was going to wreck the case, but he saw at once that I had acted wisely.

(3) We had been doing a good business with the Glasgow people for years. They refused to continue to have any relations with us. No doubt they felt that unless I had come to the plaintiff's assistance they might have succeeded in defeating him.

ARTIFICIAL STONE-PAVING.

A NEW SCOTTISH INDUSTRY.

By W. DIACK.

A REMARKABLE change has taken place in the methods of street paving within the past few years. Wood, concrete, and tar-macadam are giving place to 'adamant' and 'granolithic;' even granite and sandstone slabs are falling into disuse, and the manufacture of various kinds of artificial paving is becoming an industry of considerable national importance. A recent return shows that in over sixty of the principal towns of Britain experiments have been made with artificial granite paving; and in these its use is (with two solitary exceptions) being steadily extended. Even in Lancashire and Yorkshire, the home of the natural flagstone, the use of granite concrete is increasing.

The older forms of paving have certain peculiar disadvantages. Concrete supplies a firm foothold for pedestrians; but in these days when pavements have to be taken up every other day for the repair of gas and water mains and electric conduits, its continued use has become impracticable. Concrete can never be repatched so as to retain its original strength; and, apart from this, the cost of taking it up and relaying it is all but prohibitive. Granite slabs are free from these drawbacks, and even on streets where the traffic is busiest will last for generations. Unfortunately, however, after they have been in use for a few months, these slabs rapidly assume a smooth and glossy surface, and soon become positively dangerous to foot-passengers. In wet weather especially, the unwary pedestrian who chances to tread on a piece of paper or peel may not infrequently find himself precipitated on the pavement in a rather undignified fashion.

Something was required which would combine the durability of granite with the firm foothold supplied by cement, and which would at the same time be furnished in blocks of convenient size. It is such slabs of artificial stone that are now being supplied in increasing quantities from the various granite centres throughout the country.

The Adamant and Stone-Paving Company were the pioneers in the manufacture of artificial stone by pressure, and their extensive works in the suburbs of Aberdeen now employ a considerable staff of workmen, who every week despatch by railway and steamboat about two hundred tons of artificial paving. The busy factory is situated among the great hills of waste granite beside the Dancing Cairns quarries—a picturesque spot in the valley of Don about three miles from Aberdeen.

At the farther end of the buildings are three powerful steam crushing-machines. Into these are wheeled the waste chips and stones from the neighbouring quarry, and soon these powerful appliances are heard crunching the shapeless chips and boulders into fine granite dust. As it rushes forth, this dust passes through a revolving sieve which separates the rougher-grained from the finer material. It is this crushed granite which forms the foundation of artificial paving. In some other districts destructor refuse has been used for this purpose, but has not been found by any means so durable as granite. To this granite dust is added a specific quantity of Portland cement and a liberal supply of water, the whole mass being thoroughly mixed by machinery specially designed for the purpose. This semi-liquid mass is then placed in a strong cast-steel mould of the size and shape required for the slab to be made, the sizes more generally used being two feet square and two feet by three feet six inches. Tight-fitting pieces of fibrous material are placed in the mould both under and above the mixture, so that when pressure is applied to it, while the superfluous water is expelled, none of the cement is lost. When the wet concrete in the mould has been carefully levelled, it is placed under the ram of a powerful hydraulic press capable of applying to the mixture a pressure of

five hundred tons. There are no air-holes or voids left in the slab after it has been subjected to a spell of such treatment; and it is just in this that the superiority of pressed flags consists.

Two styles of hydraulic press are used in the manufacture of slabs, and the latest and most improved is in some respects the simpler of the two. A set of three rotating moulds revolves round the central column of the press. The wet concrete is filled into the mould at a point we shall designate A. Then the table containing the three moulds—all of which are equidistant from one another—is made to revolve exactly one-third of a circle. This brings the wet concrete immediately under the hydraulic ram, a point which we may term B. The ram descends, and the superfluous water is expelled. While this is being done the second mould of the series is being rapidly filled with wet concrete and carefully levelled. Again the table makes one-third of a revolution. The liquid mass has again reached the point directly under the ram of the press, and the pressed slab has been carried forward one stage farther—namely, to the point C—where it is removed from the mould. Here a hydraulic lift pushes up the newly pressed slab until it is clear of the mould, when it is immediately seized by the vacuum discharge-gear and transferred to a trolly, which, when loaded, is at once wheeled off to the drying-shed.

Immediately the pressed slab leaves the mould the table again makes a one-third revolution; the empty mould returns to the point A, where it was first loaded, and thus the cycle goes on indefinitely. It will be seen that three operations are always being conducted simultaneously. At A the mould is being filled with semi-liquid concrete, at B the concrete in the second mould is being subjected to hydraulic pressure, and at C the finished slab is being discharged from the third mould.

To work this press only two attendants are required—one to fill the moulds and operate the levers, and the second to remove the finished slabs. By means of this press an output of from thirty to forty slabs per hour can be readily obtained—a considerable improvement on the earlier style of press, which is at work in another part of the building, and where the massive steel moulds have to be conveyed backwards from the discharging-bench to the loading-bench by means of a hydraulic crane.

Before the slabs are ready for use they must, of course, undergo a period of seasoning and maturing. When the specially built trollies have been loaded with slabs they are wheeled into the spacious drying-shed already referred to, where the 'adamant,' resting slab above slab, undergoes the first stage of the maturing process. The drying, however, must not proceed too rapidly, for the quality of the stone is greatly improved if the concrete retains its moisture for several days. For this reason it is desirable to prevent as far as possible the free circulation of air by keeping the slabs indoors for a time. After remaining for several days in the drying compartment, the slabs are taken into the open air and piled in huge stacks, where they remain until thoroughly matured and ready for use.

The artificial stone thus produced not only forms a dense, non-porous, non-slippery paving, but is as easily worked as the finest York stone. Its remarkable power of resistance to crushing force was shown by a test made recently by Messrs D. Kirkcaldy & Sons, the well-known London experts, who found that a slab one foot square and two and one-eighth inches thick was crushed at 413·1 tons.

The growing popularity of this form of artificial paving is shown by the statistics furnished by the Aberdeen Harbour Board. In 1896 only nine hundred and forty-eight tons were despatched by steamboat from the Granite City. Gradually the figures mounted up until in 1903 the quantity despatched had reached five thousand one hundred and fifty-seven tons. To these figures must, of course, be added the amount used locally and the quantities despatched by rail to inland centres.

The success of the Aberdeen experiment has led to the establishment of plant for the manufacture of artificial paving in various other granite districts throughout the country—at Shap, Greenwich, and Leicester, as well as at Cambridge, Fulham, Wigan, Newport, and other important centres; and all the present indications point to yet greater developments in this newly established industry.

TAPESTRIES.

This, beloved, is the chamber—so the guide-book doth affirm us—
That a queen did once inhabit in the dim, forgotten days;
And the tapestries around us by her royal hand were woven,
All these verdant orchard alleys, little Cupid-gods, and fays.

Deep and narrow gleams the casement, like an eye by age ensunken,
Yet its light, though scantly measured, not less surely hath prevailed;
And the colours on the arras, so voluptuously splendid,
Have through fleeting generations to a sober sadness failed.

Only here and thither glancing, through the maze of sombre stitches,
Runs a thread of gold untarnished by the circling of the years;
All invincible it speaketh, by a dusty sunbeam challenged,
Of the gallant souls before us, of their passion, of their tears.

And my thoughts and fancies, dearest, that a moment's wistful gazing
On these melancholy relics seemed to render most forlorn,
Change to gladsomeness and courage when I see thee, sweet, beside me,
For I whisper, Love the golden doth each age, undimmed, adorn.

SIXTH SERIES.

AN EDINBURGH RAT-CATCHER OF THE OLDEN TIME.

By Major-General TWEEDIE, C.S.I.

WHEN I was a student at the Edinburgh University some fifty years ago, a familiar object on the sunny side of the Grassmarket was old Jamie Gordon the rat-catcher. Even now, in walking down the Bow or the Candlemaker Row I sometimes wonder why no one in the least resembling Jamie ever comes in sight. Is it because his kind is extinct, and the rats are electrocuted nowadays, or is it that only the young have eyes for oddities, while to the old all things seem alike? The reader will please pardon this piece of moralising. I was talking of James Gordon, rat-catcher, the shambling, shuffling, blue-bonneted Jamie, the weak-kneed and dilapidated Jamie, whose clothes were only fit to be hung up in a potato-field, and who cared so little for appearances that he would not have bartered away a glass of whisky for the best suit that ever hung at a shop-door. Jamie at home and Jamie abroad were two different fellows. 'Bosom of the family' he had none to speak of, all his children being out in the world; but he lived, when I knew him, in a one-roomed 'house,' so called by courtesy only, at the end of a long dark passage which burrowed its way into one of the much-divided and subdivided blocks of building then separating the West Port from Laurieston. Inside of his crib his normal state was that of slumber after his nocturnal labours of snaring rats in slaughter-houses and tanneries, picking up 'orra duds' which had been left out too late in bleaching-greens, filling a mysterious basket with vegetables from market-gardens, and otherwise looking after property. Out of doors, with two or three terriers at his heels, there never was any one more wide awake and cheerful. If the police winked at him as he winked at the police—that is, with ineffable good-humour and drollery—that explains the comparative immunity which he enjoyed from oakum-picking! Even M'Levy the thief-catcher, when spoken to about him, would say good-naturedly, 'Jamie 's been long about; never mind him.' The terriers were more of a make-believe than anything else. The war against the rodents was carried on chiefly by means of traps, poison, and other devices; and the terriers were merely kept for sale to those who jumped to the conclusion that a rat-catcher's canine aides-de-camp were bound to be 'fell chiels at the vermin,' as Dandie Dinmont said to Brown. And so it may be with the one or two terriers which a rat-catcher in a rural district keeps for his own proper use; but those which the rat-catcher buys or steals one day and sells the next belong to a different category. Jamie's features were so villainous, and yet withal so comical and so typically Scottish, that he was in some request with artists; and indeed it was in the studio of one of the great group-painters of the period, the late Mr Erskine Nicol, that I made his acquaintance. Following up the introduction, I occasionally visited Jamie in his den, which was light enough once it was entered, owing to its window opening on a ropewalk—that is, a strip of ground used for rope-twisting. By favour of the rope-maker, the terriers had the run of this convenient space instead of being put on the chain. Jamie's sayings were neither many nor original; but when he was asked one day how it was that his doggies needed no tying up, his answer was worth remembering. 'I tie them by the teeth,' said he; which, being interpreted, meant, 'I feed them so well and treat them so civilly that they never think of leaving me.' The writer of this little sketch has held since those days many diplomatic situations in many countries. He has had to do with Indians, Afghans, Ethiopians, Persians, Arabs, and others; and Jamie's plan of 'tying them by the teeth' he has simply found invaluable. Indeed, it has hardly ever failed him; and he hereby hands it over free, gratis, or the next thing to it, to the readers of *Chambers's Journal*. The interior of the old man's dwelling was more like rat-fancying than rat-killing. Cagefuls of the hateful vermin were stowed away under the bed, and other cagefuls hung from hooks on the wall.

[*All Rights Reserved.*]

Sometimes the inmates of a cage would fall foul of one another, and join battle like human beings, the slaughter ending in cannibalism. The rats in the cages were not always of Jamie's own catching. His great purveyors were the brood of gamins and street-arabs who in these advanced days attach themselves to literature. At that time Edinburgh had no evening newspapers or newspaper-boys. The ancestral stock of the ragged urchins who nowadays sell the specials on Princes Street found its vocation in the fifties in fishing for rats at street-corners. A string with a running noose at one end of it would be let down through the grating in the gutter into the sewer below. A slight enough bait would serve to bring the rats forward one after the other. And then a jerk and a pull, and up would come a sleek creature, with a piece of tight-lacing round its middle, squealing with terror like a snared leveret. A little ragamuffin who had filled his pockets, or, if he had no pockets, his bosom, with rats in this manner had only to carry his live-stock to Jamie in order to obtain the market price for it, which ranged from a penny to threepence a head according to the demand. 'Demand? What could anyone want with such loathsome cargo?' may here exclaim some puzzled reader. But, in sober truth, the captured rats formed, as I suppose their remote descendants do at this day, important figures in a great educational system. Everybody knows, or ought to know, that the education even of the most thoroughbred terrier can no more proceed apart from rats than can that of the young doctor proceed apart from anatomical subjects!

Considering what a very great seat of learning the Modern Athens has always been, it is probable that schools of ratting—'extramural' schools, of course—have a place at this day among its institutions, though of this I know nothing. But in Jamie's time the university city was uncommonly well equipped in this respect. Honest James himself, indeed, was the keeper of a modest grove in which the question was put to terriers in Socratic fashion. *Petits maîtres* from George Square and its vicinity frequently gave him a call with terrier puppies which were candidates for honours, but as yet unentered. With enviable *sang-froid* Jamie would then introduce his hand into a cage of wriggling, squirming vermin, take one cannily by the scruff of the neck, tie a long string to its tail, and set it on the run in the ropewalk. 'Beast or body,' said Dandie Dinmont, 'education should aye be minded;' and this is readily granted. But a very sad pity it is when, owing to the force of circumstances, our boys have to be brought up too exclusively in a town. What youth having any practical acquaintance with the stackyard and the barn, the hillside ferreting-match and the otter-hunt, would so far demean himself as to set a terrier a-yammering at the tail of a tethered rat in the West Port of Edinburgh? But this by the way.

The Grassmarket seminary of polite learning was only for beginners. 'Little fishes are sweet' was what Jamie said when very young gentlemen brought their terriers and paid their fees at sixpence a rat into his grimy hand; but his real harvests came to him when a great *exposition* was being given at a regular rat-pit, and perhaps a hundred rats had to be delivered all in prime fighting fettle, and punctually to the minute. A rat-pit, it should perhaps be mentioned, was not a 'pit,' any more than a cock-pit was a 'pit'—I trust that both structures may now be spoken of in the past tense—but a circular space enclosed with palisading; and a hundred rats turned out together in so tight a place made work for a 'senior wrangler.' About the time of which I am writing a really eminent man came to Edinburgh, an Irishman of the name of M'Fadyen, who in his own select circle enjoyed undying fame in connection with a high-class piece of London ratting. With bated breath it was told of him that he had actually presided on a certain historic occasion when a monkey was backed to destroy a hundred rats in a rat-pit in an incredibly short space of time. Only those who were in the secret, and M'Fadyen among the number, backed Jacko, who, however, at the appointed moment jumped into the arena armed with a little hammer. In the articles of the match there was nothing to forbid the use of such a weapon. *Rap, rap, rap* from the hairy one's hammer, every rap on a rat's cranium, and the bets were won. With the spoils of this masterstroke, M'Fadyen, as I was saying, had started an exceedingly high-class canine college, mostly subterranean, within a short distance of the Tron Kirk. Through the appointment of a badger as one of the resident professors, the curriculum was carried to the highest point which the law, as it was in those days, tolerated. In the rat and cat department James Gordon was the purveyor both in ordinary and extraordinary. In short, the institution was one of which any city in the world might have been proud. But unfortunately the police took a different view. M'Fadyen was found to be 'wanted' in some other place; Edinburgh fell behind again, and Jamie's business as an educationist was thrown back on his private pupils, the smaller rat-pits, and the canine repositories.

If modern Edinburgh can boast of a canine repository I do not know of it; but in Jamie's day there were several dealers whose yards and kennels the most fastidious might visit with pleasure. Foremost among these was Wullie Carlyle, a Roxburghshire man, and one of the greatest authorities then living on the points of the Dandie Dinmont. Carlyle's premises were in the Lothian Road, which as yet abounded in unreclaimed spaces. Never do I pass what was once the entrance, at a spot about opposite the middle of the present Caledonian Railway goods station, without recalling the image of Jamie, as I have so often seen him, squatted there on his hunkers, with a mysterious poke beside him. His errand at such times was plain enough to the initiated: some one who was about to pick a terrier had trysted him to be there 'in the hour of cause' with

a few live rats, or, sad to relate, perhaps a pussy cat, for it was all one to Jamie. Practical tests and trials of this sort were, however, the very things that Carlyle detested. He kept a spring-cart and a mule for carrying him twice a year over the Border country. From these trips he would return with puppies packed under a net as thickly as little pigs on a market-day in Dumfriesshire; after which he expected his customers to take the 'game' or pluck of his selections for granted, and be thankful. A high-handed man, and a big one to boot, was Wullie; and woe betide the rat-catcher daring to enter his precincts otherwise than closely following a patron from whom good prices were in prospect!

These glimpses into bygone times are perhaps too trivial to be worth opening. But the old cannot help recalling the scenes which were once familiar, and it is but natural if they indulge the opinion that others will like to read of them in leisure moments.

GIANT CIRCUMSTANCE.

CHAPTER XI.—MEDICAMENT.

AS Challis was going along Park Lane he overtook Colonel Trevor sauntering slowly towards the Marble Arch at a pace that became a wooden leg and a certain regard for appearances.

'Ah, Geoff, dear lad, you're the very man I want. I've got a most infernal fit of the blues. Come along with me and cheer me up.'

'Where to?'

'The club.'

'Which club? You patronise so many.'

'Retired Services—Old Fogeys.'

'All right. I'll go there with you. I feel a bit that way myself.'

'I see. Does it strike you, my boy, that you may be a trifle thin-skinned in patches?'

'Shouldn't be a bit surprised, colonel. Circumstances have tended somewhat that way. How have you been keeping yourself?'

'Fairly. I miss your uncle sadly.'

'Dear old chap! I can't get used to it. I'm always expecting him to turn up.'

Geoff took his arm and assisted him into a hansom at the corner, and they jogged on in silence till Trevor broke out, 'I'm inclined to think I'd exchange if I were in your place, you know, Geoff.'

'No, you wouldn't. If you were in my place you'd cut it and go farming.'

'Gad! I believe I would. I've wanted to be a farmer all my life, but I never had the chance, and now I can't afford it. It's a costly business, I believe.'

They had a comfortable little dinner, and several of the old fogeys came up to Geoff and shook him warmly by the hand, gruffly expressing their sense of loss in his own. They clung to one another, these old fellows, you see, and the call that summoned one of their number pealed a warning for the rest. They were short-tempered at times, and quick and hot of speech as a rule, but very warm-hearted; upholders of the older ideas and of a high code of manners and morals, which made them look somewhat askance at some of the doings of the younger folk. For them the past was mellowed and refined, since they remembered only its outstanding glories. The smaller things, which had irked them at the time, were forgotten, and in the light of the past the present seemed crude and wanting.

As Geoff and the colonel were travelling slowly towards the latter's chambers in the Albany they were brought to a stand by a sudden turmoil in a dark little street opening off Piccadilly, a smothered turmoil of battle—deep-drawn breathings, subdued curses, blows, and the spasmodic tread and shuffle of many feet, and a writhing mass of ragged urchins whirled into view beneath a lamp. There might be a score or so, but they were bunched in such a coil that all that was visible was a bristle of arms and legs, and occasional strenuous faces bobbing up to the light and dipping quickly out of sight again. Then the bunch disintegrated suddenly. Several small figures lay upon the ground, and the victors proceeded to kick them up again.

'Stop that!' shouted Challis, striding forward, and at sound of him they were gone like a scurry of fighting sparrows, all except one who lay still.

The two men bent over the prostrate one. The fact that he was there proved him insensible; item, considerable flow of blood from several nasty cuts in the head; item, one leg twisted beneath him in a way a small boy's leg has no right to be unless it is broken.

'Hospital. I'll see to him, colonel,' said Geoff, and picked the small figure up and walked off with it into Piccadilly. A policeman strolled up inquiringly.

'It's all right, constable. A set of young rascals fighting, and this one seems to have got some kicks. I'll take him to St George's and see him strapped up.'

'Right you are, sir! Just little divvles they are up some o' them side-streets. Never happy unless they're plugging one another.'

'Boys will be boys,' said Geoff.

'Just little divvles,' said the constable oracularly. 'And not content with their fistises, but they must go belting and kicking.'

Trevor saw Geoff and the boy into a cab, the constable sauntering off on a fruitless investigation of

the street out of which they had come. A minute later several small figures stole silently out of dark corners and sped away after the cab to learn where their chum should be landed, and Colonel Trevor walked slowly towards the Albany.

The small boy came to himself before the hospital was reached. Possibly the unusual experience of riding inside a hansom tended thereto.

'Now then, wot 's this?' he demanded imperatively. 'W'ere you a-takin' me to? I ain't done nothin'.'

'Yes, you have. You've got your head cut open in half-a-dozen places and broken your leg. I'm going to get you patched up.'

'I don' need no patchin' up. Jes' you le' me—le' me—le'—me'—— and he went, and remained away till the doctor had cut away some of his tangles, and washed and stitched up some of his cuts, and plastered the rest, and strapped up the broken leg.

As soon as he opened his eyes again he tried to get off the bed with 'bolt' in his face.

Geoff caught hold of him. 'Now, sonny, just you lie quietly there. Your leg 's broken and you 've lost blood.'

The small boy looked down at his strapped leg and felt over the unusual condition of his head, and then lay staring at Geoff.

'Well, I'm blessed!' was his brief summing-up of the situation.

'You'll be all right in a day or two, except the leg. That will take longer,' said Geoff, with a nod. 'Any one you'd like to send your present address to?'

'Naw!' And presently, in a tone of hopeful anxiety, 'Say, mister, did I come 'ere in a keb?'

'You did. Hansom.'

'Aw!' and he blinked hard at Geoff. 'Army man?' he inquired, as the result of careful investigation.

'Yes. Artillery,' said Challis, humouring his patient's bent. 'Just back from Soudan.'

'You 'll le' me go soon 's I 'm all right, capting?'

'Certainly!'

'Right-ho! Then I—think—I 'll go—to—sleep;' and he turned over and was asleep in a moment.

As Challis left the hospital he became aware of sundry small black figures dodging corners behind him, and of shrill whispers.

'That 's 'im!' 'That 's the cove wot took 'im.' 'Arsk 'im, Jimmy!' and so on.

'Ask away, Jimmy, my man. Don't be frightened,' said Geoff, stopping and speaking into the surrounding darkness. 'Is that one of your mates that got hurt?'

'That 's it, guv'nor. 'E ain't dead, is 'e?'

'Dead? Not a bit of it. Leg broken and head knocked about a bit. He 'll be all right in a week or two. How did it happen?'

'Aw! We was jist 'avin' a scrum wi' some o' 'em Proossia Street chaps, an' the capting 'e got downed.'

'An' they kicked 'im w'en 'e was down. They allus kicks, does them Proossians,' said a shrill little pipe.

'Ah! kicking 's bad,' said Geoff. 'Kicking 's not in the game.'

'Naw, 'tain't. But they kicks all the same.'

'Will you tell his people where he is—his father and mother, or whoever it is he lives with?'

'Ain't got any people, capting ain't. 'E 's all on 'is own.'

'What does he do?'

'Aw—lots.'

'And where does he live?'

'Anyw'eres.' 'Now'eres.'

'And do you all live anywheres, nowheres?'

'No; we 've got 'omes, most on us. An' some 'f us 'as got fathers an'——

'An' some 'f us wishes we 'adn't,' piped the shrill-voiced one.

'That 's a bad lookout,' said Challis. 'I shall come across to-morrow morning at eleven to see the captain. If you 're here I 'll tell you how he 's going on.'

'Thank 'e, sir! 'Night, sir!' and they were gone, and Geoff went thoughtfully home to his big, lonely house; and as he looked up at it, and thought of the few heads it sheltered, he thought also of the rough little heads that had no homes to go to—or if homes, of such a character that they would have preferred being without them.

When he walked round in the morning he was amused to find Colonel Trevor there before him.

'Well, captain?' said Geoff to the small boy, with a military salute. 'How goes it?'

'I 'm all right 'cep' for this 'ere bloomin' leg and this 'ere bloomin' 'ead. 'Ad to stitch it up, the old bloke says. Three stitches an' two stitches. 'Ow long 'll I 'ave to be 'ere?'

'You must get that leg well, you know, or you might break it again and have trouble with it.'

''Ow long?'

'Maybe a week or two.'

'Not in this 'ere bed?' in a tone of alarmed remonstrance.

'No; they 'll let you get up in a day or two, I expect, when your head 's better.'

''Ead 's better now.'

'Is it? Then we 'll have a chat, you and I; and Colonel Trevor can stay and listen if he wants to.'

'Old bloke a colonel?'

'That is Colonel Trevor, V.C. He fought in the Crimea and left one leg there.'

'My! I 'd jolly well leave both mine for a V.C.'

'Good boy!' said Trevor, with a benignant smile.

'Now, captain, never mind the colonel 's leg. Lend me your ears!'

'Garn! Wot d' yer'——

'I 'm not going to take them off. I want to talk to you, and I want you to listen.'

'Talk so 's I can understand, then. Is it a preach?'

'No, it isn't a preach. What 's your name, and where do you live?'

'Name's Dick. They calls me Bantam. Don't live anyw'eres in partic'lar. Coving Gawden 'Otel might find me, an', ag'in, it mightn't.'

'Got any relations—fathers, mothers, sisters, brothers, uncles, cousins, aunts?'

''Ow yer does reel it off! Naw! Ain't got any of 'em, an' don't know 's I wants 'em.'

'Quite on your own, eh!'

'Rather!'

'Like it?'

'Like it better 'n some wot I sees.'

'How would you like to have a place you could always go to at nights?'

''Pends on the place. None o' yer 'omes for me, so don't you'——

'No, I didn't mean that. Just a little home for yourself.'

'Garn! Think I'm a millinaire?'

'Can you read and write?'

'Yus.'

'Who taught you?'

'Never you mind! When I'm big enough I'm goin' to be a soger too. An' you gets on best if you kin read an' write, so I learnt 'em. Sums too.'

'Good boy!' said Trevor.

'Well now, captain,' said Geoff, 'here's an idea that has come into my head during the night, and I want your opinion on it. Suppose I took a room in your neighbourhood, and put in tables and chairs and things, would you and the other fellows care to use it as a kind of club all for yourselves, where you could always meet and talk and have games if you wanted? Kind of headquarters, you know.'

'Smoke?'

'Do anything you wanted so long as it was on the straight. But if you want to be a soldier, I advise you not to smoke just yet.'

'An' why?'

'Because it will keep you small and puny. Smoke as much as you like when you've got your height. You don't want to be just a drummer-boy or bugler, I suppose?'

'Not me! I'm goin' to be a sarjint.'

'Then you want to grow. We might perhaps have some drilling and gymnastics at that room I was speaking of.'

'Any preachin' t' make yer sick o' yerself?'

'No preaching to make you sick of yourself. Perhaps we could manage a bit of a band later on.'

'Fifes an' drums?' with great accession of interest.

'Fifes and drums, by all means.'

'And a uniform for marchin' out?'

'A uniform for marching out, by all means; and in summer a fortnight under canvas at the seaside somewhere.'

'Real guns?'

'Real guns.'

'I'm on! Say! you ain't dotty, be you? An' you ain't gammonin' a chap wot 's down?'

'I'm not dotty and I'm not gammoning a chap what 's down. I'll do my part if you and the rest will do yours. You're quite sure of the rest?'

'You bet! I'll see to 'em. They does wot I tells 'em.'

'All right! You get that leg better as quick as you can, and we'll see to it between us.'

'Right-ho!' And they left him lying with visions in his eyes.

When they came out of the big front-door they became aware of a warm discussion going on behind one of the pillars.

''E won't care for fl'ars, yer Johnnie!'

'Yus, 'e will. Yer does w'en yer in 'orspital, even if yer doesn't w'en yer not. Wus in 'orspital myself wunst, an' I knows.'

'Packet o' ceegrettes would be more in capting's line.'

'Won't let yer smoke in 'orspital.'

Then a tously head and two sharp eyes peered round the pillar and caught sight of the two men, and silence fell on the ragged group.

'Good-morning, boys!' said Challis. 'Come to ask after the captain? He's going on all right. Five stitches in his head and his leg in splints.'

'W'en 'll 'e be out, capting?'

'Not for a week or two perhaps. That leg will take time, you know. Like to see him, some of you?'

'Yus, sir,' very eagerly from every man of them.

So he got permission, and the awe-stricken company filed in on their toes, with deprecatory sniffles and quick side-glances at everything within range; and when they came to the captain's bedside the shame-faced grins which shot to and fro set the nurses smiling in company.

The flower-bearer bashfully tendered his offering, which the captain received characteristically.

'Thank 'e, Squeaker. Sneak 'em?'

'Naw, I didn't. Kerried a fat wife's barskit to Waterloo, an' she give me them an' tuppence.' Then, with a face like the setting sun, and voice all squeaks and jerks, 'Bought yer some smokes wi' ther tuppence;' and he shoved a dilapidated packet of cigarettes at his leader.

'Yer a good sort, Squeaker. But they won't let me smoke w'ile I'm 'ere. 'Sides, I've stopped off smokin'.'

'Aw, capting!' with a smothered guffaw and an admiring glance, under the belief that this sudden face-about was assumed for the temporary benefit of the higher powers.

'Fac'! An' you chaps 'ave got to stop it off too, or yer'll never grow big, an' yer'll be buglers and drummer-boys all yer lives.'

A shuffle of discomfort was the only response to this exordium.

'That old bloke's got a wooden leg. 'E's V.C., an' 'is leg's in ther Crimea;' and all the beady eyes turned on Trevor and Challis, who stood at a discreet distance to give them fair-play. 'T' other 's artillery,

an' 'e's goin' to take us a room for 'eadquarters, an' give us drills, *an'* uniforms, *an'* real guns, *an'* drums an' fifes, *an'* a camp at seaside, an'—oh, my blessed buttons—ain't we goin' to 'ave a glory 'allelujah time w'en I gits out! Blame this leg!'

''Ow's yer 'ead, capting?' asked spokesman Squeaker with pointed delicacy.

''Ead's all right. Got five stitches in'—with a touch of pride. 'I ain't dotty, Squeaker. Neither's 'e. I arsked 'im straight. Yer kin arsk 'im yerselves.'

'Now, you mustn't get excited, captain,' said a pleasant-faced nurse, 'or your head will suffer;' and Challis came forward to marshal the ragged brigade out.

'Proossia Bob's bunked it, capting,' was the Squeaker's parting news in a delighted whisper. 'Thought 'e'd done fer yer.'

'Chump!' said the captain. 'I ain't killed so easy's all that.'

'So you're going into the ragged school business, my boy?' said Trevor as they crossed into the Park.

'I'm going to give a waste product a chance of turning itself to good account. It's too valuable to run loose in the gutters, and it'll give me something to think about. I can see great possibilities in it.'

'So can I, if you'll let me bear a hand.'

'Your leg and your V.C. will be a famous draw. Now let's go and search for a house for our lion-cubs.'

(To be continued.)

IDLE HOURS IN CÆSAR'S CITY.

By G. G. Chatterton.

WHERE but in Cæsar's City may one so satisfactorily welcome idle hours? Where else spend them with such rich results for mind and eye as in this centre of contrasts and contradictions alike in its buildings and its inhabitants? The passing visitor is denied these idle hours because of the enormous pressure upon time its sights demand; but for those who may tarry awhile, how fascinatingly can they slip by apart from any special end in this catholic, cosmopolitan Rome, where class jostles class, and the modern elbows the antique, and the sordid runs parallel with the splendid more than in any other town the world contains! Close round the Vatican—greatest of palaces, which covers thirteen and a half acres of ground and contains eleven thousand apartments—run narrow, evil-smelling streets, each one, however, marked proudly with the fine white marble slab bearing its name in large, clear-chiselled letters with which every street in Rome is practically and decoratively labelled; and straight off such slums the great bridge across the Tiber, adorned with splendid antique statuary, conducts to the old Castel San Angelo, crowned with its beautiful Destroying Angel and forming one of the most picturesque parts of Rome.

But with none of these objects have we to do at present, out this short winter afternoon to idle merely; not to seek things, but to let things come to us with the piquant contrasts which Rome seems almost to plan to lay before its visitors. We stroll down the Corso (the gay and fashionable street so called because in former times during Carnival horse-races were run in it), past Prince Doria's magnificent Palazzo and the rows of large modern shops, making slow progress on the narrow footway, thronged like the street with all varieties of humanity: soldiers in light-blue and in dark-blue uniforms, and those of the Bersaglieri with their full dark cloaks and wide hats with the wonderful sweeping plumes of glistening dark-green feathers; barefoot Franciscan monks in brown cassocks with knotted-rope girdles, and Carthusian monks in white with red and blue crosses. Priests and tourists swarm equally; and the street is thick with the open landaus of fashionable ladies driving up and down to see and to be seen, with the traffic of the hired carriages and the long carts of the overladen, gaily-tasselled mules; whilst anon comes the sombre chariot, all black without and within, of some cardinal on his way to his affairs. We turn off by the Via Condotti (so named because beneath it is the conduit of the rushing waters of Rome), to arrive at the Piazza di Spagna, the great central square bordered by shops of jewellery and *bric-à-brac*, hotels, tea-rooms, and the most picturesque of all the flower-markets, held formerly round the basin of Bernini's pretty fountain, but from whence, perhaps with advantage, ousted when the electric tram-lines were laid, and the merchants were permitted to retire to the foot of the noble *scalinata* ascending to the Trinità Dei Monti. Here in a long range they bank their lovely flowers, backed according to the season by tall mimosa, eucalyptus, and pink almond-blossom, forming even in winter a blaze of colour in roses and violets, irises and carnations; narcissus and snowdrops nestle in white tufts among green ferns, and the penetrating scent of mignonette adds to the perfume in the air.

Flitting up and down the steps, or basking on them gossiping and eating their favourite burnt nuts out of paper horns, are the artists' models, who congregate here for selection; whole families from one generation to another pursuing this calling so eminently to the fancy of the indolent Italian, the beauty it demands inheritedly descending. The peasant costume is scrupulously maintained, the women wearing the curious, but to them becoming, square head-gear, snowy shirt-bodice laced in by the

wide velvet corslet, and gay-coloured, short, full skirts; men and boys with soft Tyrolean-shaped hats, short coats and breeches in soft-toned russet blue and green velveteen, and blue stockings cross-gartered—all adding a charming effect to the region of the Piazza di Spagna. Groups of the boys are gambling with the *soldi* their parents have given them back out of their earnings; some small urchins, eagerly engrossed, who can stake but in *centesimi*. We must pause to admire the pretty little faces before, retracing our way down the flight of steps, we pass along the Piazza by the Hôtel de Londres to take the road which slopes up to the Pincian Hill.

It is a pleasant way, edged on one side with pepper and ivy and ilex trees, and on the other the high wall of the Pincian terraces, tufted with fern and creeper and cactus. In front of us are winding round, a long file two and two abreast, of the scholars of the Jesuit order, the *prêti rossi*, in their brilliant crimson coats, commonly introduced with excellent effect by Roman artists into their landscapes, and showing well now in the living picture; and as we pause to admire a shrine let into the wall, a white marble Madonna and Child standing out in high relief, with a little votive lamp burning brightly by them, a peasant woman comes toiling up the slope. By the hand she leads a tiny boy, a tinier one is in her arms, and she halts to cross herself before the shrine and to mutter a prayer; the tiny boy likewise crossing himself whilst taking off his hat. The baby's head must be uncovered too, his hat untied beneath his little chin, and he is placed upon the ground to stand, and taught to sign the cross. So waveringly his small fat fingers stray in his attempts, whilst his brother, in pride of age, signs it glibly many times in example for him. It is a charming incident in our way before we are on the Pincio, the centre of the public drives and gardens on the ground where once stood the sumptuous palace of the Acilii Glabriones, before it lapsed into a desert waste where in the Middle Ages the ghost of the tyrant Nero was believed to wander, and which to-day is to the Eternal City as is Hyde Park to London.

Here in one end of the circular sweep, where the date-palms tower high, the band plays in the afternoon and the Roman world drives round and round the limited circle of the carriage-drive, or the fashionables pull up to take the air and receive the visits of their friends on foot. Handsome equipages, coroneted, with well-bred, well-groomed horses, there are in numbers; the footmen, who descend immediately the carriage halts, standing at its back behind the mistress until she orders it to proceed again. Mounted gendarmes command the traffic, and present an imposing effect with their shining helmets and long dark cloaks, covering to their horses' quarters, flung aside, displaying rich-toned orange lining. In London Hyde Park, far away, how chill and misty is it in this hour of the December day! But here the scene is bright and gay. True, the flowers have still to wait their beauty. The roses are yet sparing of their bloom, and the camellias but in bud; but the length of the terrace-gardens of the hill the orange-trees glow golden with their fruit, and its high grounds are verdant with palms and bananas and pepper-trees and the deep green of the ilex; and the sun, shining down brilliantly, as in Rome it will even in midwinter, glints on colour everywhere. For who need wear sombre garb? Not the ladies in their carriages, whose dark wrap waits in the fur to throw across their shoulders when the sun goes down. Not the children: neither the little *donnas* in white and ostrich-feathered hats, who play and toss their gay striped balls, nor the youthful Romans of the poorer class, who play here too in their bright red or blue frocks. And extra gay figures in the crowd are the nurses who carry the infants of the aristocracy on white satin pillows covered with fine lace. Their full skirts, always of some brilliant colour, are trimmed round with a broad band in a contrasting tone; round their heads a thick quilling of gay ribbon finishes in a bow at the nape of the neck, and falls in wide sash-like ends to their feet; whilst the coil of their dark hair glitters with adornments: large gilt combs with balls, and pins of gold and silver filigree flowers a good inch in diameter. They wear filigree ear-rings to match, and altogether are most picturesquely striking figures.

The seats are all full, the penny chairs all taken. Men who in lands different from this easy-going one would be busy at some occupation, sit reading the papers or chatting with their friends as they watch the shifting crowd; and the students from the priests' training colleges stroll by to get the air and listen to the band, they too subscribing largely to the colour in the motley with their long coats of crimson, of blue with orange slashings, and purple with red.

Then by degrees will fade the warmth from the sun and the glow out of its shine; the last blare from the band rolls out, and the throng breaks up. From the churches in the town below ring the Ave Maria bells, and we walk along the Pincio to the Trinità Dei Monti, where at the Ave of each day the unseen nuns in choir so sweetly sing the Vespers. Tunefully swells and sinks the simple cadence with an indescribably restful, soothing influence, making us wish that its service could be twice as long before we turn out again among the beggars gathered round the door to catch the visitors emerging. Hurrying up comes the one-legged man who earlier posts himself for the gay folk on the Pincio, his little dog with its absurd little high hat with feather plume begging at his side. Its hat is now thrust hastily upon its head again, and it resumes its begging posture, and we drop some *soldi* in its little tin before we cross to the wall opposite, over the long steps down to the Piazza di Spagna, to see the afterglow of the sunset behind St Peter's, framing in a flame of saffron streaked with tongues of fiery red the great dome which so majestically dominates

the dome of every other church in Rome. Magnificent always behind it are the sunsets, and they linger long, as though, like ourselves, loath to quit the scene.

But the day is done. The last of the artists' models come straggling up the flight of steps: a family, the father fiercely handsome, after a wild, typical bandit fashion, dark and bearded, leading by the hand his small, quaint replica in costume, a tiny boy of quite perfect child-like beauty, with cherub face and large, soft gray eyes, gray with the blue shadows that only Italy provides; and the mother, a mild walking Madonna, carrying a rosy, black-eyed infant. The beggars have finished gossiping and are all dispersing; the little dog, knowing that now comes the time of an uncovered head and the uninterrupted enjoyment of all four feet, frisking along gladly on them. And so we too must turn homewards with pleasant and abiding memories of our idle hours in Cæsar's City.

A STORY OF THE BASQUE COUNTRY.

CHAPTER III.

LUCKILY for the poor fellow, the lower surface of his prison was quite smooth, and the hole itself sloped upwards, and was not so very small, after all, inside. Indeed, if he had not been bound he might have lain almost comfortably in it. And he reflected, 'It might have been worse. The men that saved my life in the cave, the men that know me, will see that I get out of this before long.'

Presently he felt something pressing against the soles of his feet, and again he heard the cultivated, mocking voice. 'Just a little pebble, my friend,' it said, 'to keep you snug and tight, and prevent you from slipping down into the river—which would be a deplorable thing to happen, would it not? True, it will perhaps deprive you of a little extra light and air; still, it does not fit too closely, and will make you so very much safer that I am sure you will appreciate it. And now I must say adieu, or, let us hope, rather *au revoir*. I see that the weather is changing, and I fear that we shall shortly have a storm, and that I shall get a ducking; you, however, have nothing to fear from the rain—ah! ah! And now, once again, *au revoir, monsieur l'Anglais; dormez bien.*' And then the voice ceased for good and all, and a deep silence reigned, broken only by the murmur of the tumbling waters and the pumping of the lonely prisoner's heart.

But the latter soon resumed its normal beat as Foster reflected that, outrageous and uncomfortable as his position was, he had really very little to fear beyond a certain amount of cramp and possible want of food. He did not doubt but that he would be released in a day or two, for the smugglers were not savages, and he had done them no harm; or, if he was not released soon, they would at least bring him food and drink and loosen his bonds, which, though soft and broad, were rather too tight to be pleasant. As he thus reasoned, his spirit rose again. He knew that, by some means or other, his wife would be assured of his safety, for the Basques always keep their word; and as she was a brave little woman, she would understand how matters stood, and patiently make the best of them. As he lay thus thinking, tired with his recent rough experience, a pleasant drowsiness stole over him, and presently, lulled by the soft murmur of the stream, he slept as calmly and peacefully as a child.

When he awoke, for some moments he could not imagine what was the matter with him, or on what strange bed he was lying, but soon the recollection of his strange adventures crowded back into his brain. He could see now; not very distinctly indeed, but still quite well enough to tell him that it was day, but whether morning or afternoon it was impossible to say. In his slanting position he could make out the big stone at his feet almost blocking the entrance to the hole, though not quite, for its upper part did not touch the roof, but left a space of some few inches through which came the comforting, welcome light. Above him, the jagged rock descended within a foot of his head, and he noticed immediately over his eyes a deep crack which glistened with what appeared to him to be wet. Doubtless, he told himself, water found its way down this fissure in bad weather, and he wished it would rain now, so that some of it—not too much—might drip into his mouth and assuage the thirst that was already beginning to worry him. Yes, the more he thought about it the thirstier he became. Rain would be a godsend. Perhaps it was raining; it was impossible for him to tell. His captor of the previous night had prophesied it, certainly; and, now that he paid attention to it, the noise made by the river did seem louder than it was before he slept. Yes, it was decidedly much louder; there must have been a storm, although not in his neighbourhood perhaps.

In these mountainous regions heavy local disturbances often occurred in the higher plateaus that sent the river down in a roaring flood, sometimes, he remembered remarking, as much as twelve hours before the actual rain—if it came at all—reached the lower parts of the valley.

Suddenly a terrible thought struck him. Suppose the river did come down? In this narrow chasm, he knew that the water would rise with appalling rapidity to a height—well, he had often noticed the débris of floods, bits of stick and such-like flotsam caught in some root or rocky projection far above his head where the banks were high. His present

miserable quarters were not more than six or seven feet above the level of the water; continued rain or even a severe storm would assuredly bring down such a spate as would in a few hours reach the level of his prison, and he would be drowned like a crippled rat wedged into a crack in a sewer.

Heavens, what a fate! His flesh crept at the thought of it. He could almost feel the water at his feet now! Merciful powers, save him from such a death! Then he remembered the smugglers' promise that no harm should happen to him. Surely they would rescue him should the river be really rising. But could they, even if they desired it? Ah! that was another question. Very little rain, a rise of a couple of feet, would render an ascent against the stream by the path up which he had come an absolutely impossible feat, he thought; and as to any hope of aid from the top, goodness only knew where the top was, or if it was sufficiently retired and screened from possible observation from the road to allow of men in the smugglers' position attempting it. He doubted it. The idea of rain now was horrible, abominable. His thirst had fled before the notion of how appallingly it might be quenched.

With straining ears he strove to gather by its sound some idea of the volume of water now descending, but his efforts brought him little comfort. On the contrary, they convinced him of the correctness of his surmise; there was no doubt about it, the river had already risen considerably. And then he heard another faint and moaning sound, which, rapidly increasing, soon developed into the rush of a strong wind, followed by the lashing of such a fierce storm as to completely smother in its wild embrace the heavy rumbling of the water.

A prey to the liveliest fear, Foster lay and waited, and as the hours slowly dragged along, and the ever-increasing roar of a tearing flood became continuous and insistent, the miserable man knew that his death was only a matter of time. Nobody could get to his rescue now, and even were he not by some extraordinary chance drowned, he would certainly be starved. It would be days before the water sank low enough for the bed of the river to be practicable.

Still the rain poured down, and still the roar of the flood grew louder and louder, and then all at once the hideous fancies of a few hours before became still more hideous realities. He felt, and shortly saw, the thin line of scum and yellow water creeping past the edge of the big stone, and rising in playful eddies round his red-bound legs and ankles!

Slowly but surely it rose, now advancing with a little spurt half-way up his calves, only to drop back again, but never quite so far as before. Luckily he had his strong, thick waders on, and at first did not feel the cold; but the creeping flood lapped him higher and higher, inch by inch, until there remained little more than the upper part of his body free from its chilly embrace. As it rose above his waist much of it found its way down the inside of his waders, and Foster, lying with agonised face slowly waiting for a dreadful death, could feel it numbing his bound limbs and crushing the heat out of him as the ice-pack drives the fever from the blood of the raving sick.

And at last only his pallid upturned face is clear. The stealthy turgid flood gurgles round his neck and in and out of his ears, singing its song of death. And then, as he gives a despairing cry to his God for mercy to his wife and boys, his tortured senses leave him, and his troubles end at last.

. . . . . .

Mrs Foster put down her novel with a yawn and looked at her watch.

'Nearly eleven!' she exclaimed. No wonder that I am getting sleepy. It's too bad of Jack to stay out so late as this, especially as he knows that I am always anxious when he is on one of those idiotic night expeditions. I'm sure he'll break his neck or drown himself one of these days, or nights rather; and what pleasure he can find in it passes my comprehension. I don't think it right, either, that two women should be left alone at night in this outlandish part of the world. Not that there is anything to fear from these good mountain folk; but some of the wandering tramps that are for ever crossing over from Spain might take it into their heads to pay the house a visit, and I don't think I should relish that particularly. I'll get the girl in. I want to see her about to-morrow's dinner. Marie!' she called sharply, rising and going to the door. 'Marie, I want to speak to you.'

The maid entered the room rubbing her eyes—she evidently had been taking a nap—and then a long half-hour passed in discussions of a domestic character before her mistress again consulted her watch.

The result seriously annoyed her.

'Half-past!' she cried in a startled tone. 'I never knew your master to stay out so late before. What can have kept him? I hope nothing has happened.'

The note of alarm in her mistress's voice quickly communicated itself to Marie, who at once began to suggest all sorts of horrible reasons, each one more impossible than the other, to account for the delay in Foster's return. With the true love of her class for such things, she poured into her mistress's unwilling ears a flood of gruesome pictures about the accidents that had happened to people who had stayed out too late in the mountains, and suggested with much volubility and relish that her master had fallen a victim to one and all of them.

Although Nellie was a plucky woman, and knew that the servant was a romancer of the first order, the recital of these horrors could not fail to exercise a disturbing effect upon her; and after another half-hour had sped, spent outside on the terrace listening for the longed-for footsteps, she became seriously alarmed and convinced that something untoward had happened to her husband.

And when the cracked bell of the distant village church boomed out the solemn twelve strokes of midnight, she determined to go down, late as it was, to the gendarmerie or the *douaniers'* barracks, and get them to make a search along the river's banks to find her missing husband.

Loading Foster's revolver—though no shot, she was not afraid of it—she announced her intention to Marie, who immediately broke out into wild ravings and wailings. Nothing, she declared, would induce her to leave the shelter of the house at that hour, and wild horses would not keep her inside it alone and without madame.

But madame was obdurate. Marie might come with her or Marie might stay, she herself was going to the gendarmerie, without a shadow of a doubt; and so, the frightened girl choosing the lesser evil, the two women made their way down on to the dusty road, and, with hearts in their mouths at every strange sound and shadow, set off on their lonely walk.

Nothing happened to them, and in due time they arrived at the *douaniers'* barracks. Here there was a man on watch, to whom they told their story, and who was rather inclined at first to make light of their fears. Luckily, he was young and susceptible, and had long cast sheep's-eyes at Marie's rosy cheeks and trim figure, set off by the, to him, novel but becoming dress of the English parlour-maid. So, after much shrugging of his broad shoulders and scratching of his black bullet-head, he agreed to awaken his sergeant and take the risk of a wigging for his pains. But the sergeant was all attention. Foster was well known to him, and many a dish of fried trout had he and his family enjoyed owing to the Englishman's liberality with his catches. He was also a man of action; and being quite of opinion, on hearing Nellie's story, that something had happened to his fisherman-friend, he quickly roused some of his men, and then ran down to the gendarmerie to alarm the brigadier there.

At all frontier villages there is no lack of these fine men. They act more or less as frontier guards, and with the *douaniers*, who are armed also with rifle and revolver—though they only carry the latter on patrol—constitute a very excellent force for this particular work. Hence a large party of both arms was soon afoot, half going up and half down the river. Nellie accompanied the latter as far as the house, to which she thought it best to return, so that she might have hot water and some food ready in case—well, 'in case that poor, dear, stupid old Jack of hers had sprained an ankle,' she told herself, 'or had fallen into the river and got half-drowned.'

But I need hardly say that the search was unavailing. With the fixed idea in their heads that Foster had met with an accident, and was lying helpless somewhere or other, they shouted loudly as they hunted along down the banks of the river and their vicinity, thus warning the smugglers that danger was abroad, and effectually by their noise preventing the chance of meeting with any of these gentry.

How the members of the band that had captured Foster evaded their hereditary foes is only known to the daring individuals themselves: probably by dispersing over the fields and gaining their homes by unfrequented paths and the useful back-window in the yard; but not one of them was seen by the searchers, who returned to their quarters soon after daylight, fully convinced that the man they sought was lying at the bottom of one of the numerous deep pools which at frequent intervals studded the river's course.

Racked with suspense, Nellie had, after preparing the necessary food and water, again left the house, unable to longer bear the drear inaction, and was awaiting the return of the men in the village; and it was almost a relief to her to see, as they straggled in in twos and threes, that none of them bore the limp and sodden burden she so dreaded. But after hearing their reports, and learning that they proposed dragging the pools later on, when they could get outside help so as to release the men for day duty, her heart sank within her. Drag the pools! Oh, ominous words! At the sound of them the tears sprang to her eyes.

The two sergeants—brigadiers, as they are called in France—were kindly old men, and did their best to comfort her.

'Take courage, madame,' one of them exclaimed; 'we still have the gorge to search—though I don't think it likely that even such a daring fisherman as monsieur would have ventured to wade it in the dark. We did not, of course, attempt it, but we shall presently unless—*tiens!*' He broke off suddenly and anxiously scanned the heavens, for a raindrop had just fallen on his face. He had grown gray in the mountain preventive service, and knew what that drop portended, and for a moment he hesitated, but only for a moment. He was hungry and tired, but his finer feelings triumphed, and calling to a couple of fresh men who had not been out previously, he hurried off with them towards the higher end of the valley. But it was a long way off, and when at last he reached the point where the river left the rocky gorge it was too late; *the water was already coming down!*

So, with a heart full of pity for the woman who, he felt certain, was about to be so sorely tried, he slowly wended his way homeward, convinced that it would be many days ere the bruised and battered body, recognisable only by some familiar mark, would be deposited in some quiet corner or on some bright shingly bar far down in the lower valley. He had seen what the wrathful river could do once or twice before.

But the pools were not to be dragged that day. The rain descended with tropical force, and the swollen yellow waters forbade anything of the kind being carried out.

Strange to say, however, this unexpected delay did not seem to affect Mrs Foster adversely. Indeed,

her behaviour since her second return to the cottage in the morning had undergone an extraordinary change. Instead of being torn with grief and fear as before, she was now calm and collected. Most of her anxiety seemed dispelled, and there was almost an air of suppressed relief about her that was most puzzling to the few people she saw. The village mayor, a worthy butcher, had gone away from the short visit he had felt it his duty to pay shocked and shaking his fat head. 'They are barbarians these English,' he said to his wife over his cabbage-soup. 'Madame has no grief at all. *C'est épatant.*'

'All the better,' was the canny remark of the lady, 'for she will be thus enabled to pay our bill on Saturday as usual; she will not have the excuses such as our people use.'

But could the worthy couple have seen the scrap of dirty paper snugly hidden in the bosom of her dress, and which the lady under discussion had found mysteriously lying on her table, they would not have been so ready to criticise, for on it was written in a crabbed and illiterate hand these wonderful words: 'Monsieur is safe. For our sakes he must remain away for a while. As you value his life, say no word to the *douaniers*.—CONTRABAND.'

It was not so odd, therefore, that she bore up under her affliction so well, and could call out almost cheerfully when, dripping with the rain and carrying the usual basket on his arm, the slim figure of the little patient of the day before appeared, 'Well, Bertrand, and what have you got to sell me to-day?'

The lad made no reply, but glanced nervously about him, and then, apparently satisfied that Mrs Foster was alone, drew close to her and almost inaudibly whispered, 'Where's Marie?' Much wondering, Nellie answered that the girl was far away in the kitchen; and, seeing that he had something weighing on his mind, she hastened to ask him what was the matter. But Bertrand found it difficult to begin, whatever it was that he wanted to say; and it was only after he had shifted himself from one leg to the other a dozen times, and twiddled his wet blue *béret*, or Basque bonnet, round and round in his nervous fingers until it had become a shapeless mass, that he found courage to ask, 'Did you get the paper?'

Nellie's heart gave a bound; but, fearful of any display of over-anxiety alarming the boy, she merely nodded her head, and patting the little chap's shoulder encouragingly, answered, 'Yes, Bertrand; and I felt at once that it was you who had left it on my table. I know you are my friend, as I am yours, and I have not told a soul about it. I believe what it says, and that no harm will come to monsieur; but I should like to hear more if you can tell me anything, dear boy.'

The lad's eyes glistened. He was evidently torn with some conflicting emotions; but when Nellie, with ready tact, said, 'And how is the poor finger, and what did you buy with the sous I gave you? Monsieur will have a whole pocketful for you for bringing the paper, when he returns,' his feelings quite overcame him, and bursting into tears, he cried wildly, 'Oh madame! he will never return again unless we can get him at once, for he is tied up in a hole in the river-bank somewhere in the great gorge, and the water is rising so fast that he will be drowned.'

Stunned by this terrible revelation, Nellie's first impulse was to give way to despair; but her plucky Irish blood coming to the rescue, she mastered her emotion, and quickly calming the excited lad, soon by a series of adroit questions discovered all that he knew about the matter, which amounted to this: while searching for hens' eggs in the straw above the bullock-stable he had overheard his father and uncle, both of whom had been out with the *chef* on a smuggling expedition the previous night, talking about the Anglais. He gathered from their words that, for some reason or other which they did not allude to, they had helped the *chef* to tie Foster up, and had put him in a hole somewhere in the gorge, meaning to let him out when something to do with the contraband had been accomplished. But the rain had made the river rise, and the *douaniers* being about when they first perceived it, they could not safely go and fetch him, and now it was too late. His father had suggested that they might get down to the hole from the top of the cliff by means of a rope, because he knew just exactly where it was; but his uncle had replied that it would be sheer madness to try it now when everybody was buzzing about, for they would be stopped with the rope and questioned before they had gone a hundred yards from the village. Nor could they hope to work undisturbed with the road running as it did not much farther away than was the edge of the cliff above the hole. And, also, the uncle had added that without the *chef's* orders they dared not act, and they knew that the latter had gone down *là bas* some hours before, and had left no instructions with them. No, the Anglais must drown; it was the fortune of war, and one of the domineering race the less was no great matter.

Such was the dreadful story that Nellie had, with infinite patience, to extract from the boy between sobs and excuses for betraying his father, who, he assured her with much earnestness, beat him always, and whom he did not love; and all the time the rain poured down relentlessly, each drop, she felt, adding to the danger of delay. And now she put a crucial question, for beyond knowing that the boy's Christian name was Bertrand, she was entirely ignorant as to the rest of it: 'What is your name, Bertrand?' she asked him carelessly, and Bertrand proudly and glibly answered, 'Bertrand Jean Marie Pierre Joseph Etcheverray,' all in one long rattle.

Her object accomplished, Nellie sprang to her feet, and without either hat or umbrella, tore from the room without knowing or caring what became of her informant. Rushing headlong down the

steep path, she made her way at top speed to her friendly old brigadier, and in two minutes that amazed functionary was in possession of the chief points in her story. Hardly had the name of Etcheverray passed her lips when her listener was calling for two men, and slinging his revolver-case over his shoulder, was off down the village, accompanied by his satellites, as fast as his sturdy old legs would carry him. He was just in time.

(To be continued.)

MYSTERIOUS WHITE RACES.

By L. E. Neame.

THE idea that in remote parts of the tropics, amidst the dark-skinned races, there exist mysterious isolated white tribes bearing a strong resemblance to Europeans has long possessed a curious fascination for the Old World. The early adventurers in Central and Southern America brought home many tales of extraordinary cities beyond the mountains, and vague stories afloat in South Africa thirty or forty years ago furnished Mr Rider Haggard with a theme for one of his best-known novels, *Allan Quatermain.*

Similar legends are met with in almost all the less-explored parts of the globe, and they have always certain features in common. The isolated white peoples almost invariably inhabit a mountainous region in a vague 'interior'—always the 'just beyond;' they hold aloof from the surrounding races; they are seldom seen, and yet are definitely stated to be more civilised and better educated than the darker masses whom they avoid. Who they are and whence they came no one knows; native fables afford no explanation. Once it was thought that forgotten white explorers might have built up unknown kingdoms in the wild places of the earth. But upon examination these theories vanish as rapidly as do the white tribes themselves, and the ultimate explanation is almost prosaic.

Yet so strong a hold has the idea gained that even at the beginning of the twentieth century the possibility of the existence of a genuine white race is not altogether scoffed at. It is less than two years ago that an American officer engaged in the operations against the Moros in the Philippines collected apparently substantial evidence relating to a mysterious white tribe in the island of Mindanao. The mountainous district in the centre of this island has never been explored, and even the coast is not well known. But along the seaboard many stories are told of the fierce white people who have their home in the forest-clad mountains of the interior. Eye-witnesses depose to having seen a strange, fair-complexioned girl loitering near a coast village, a girl who fled towards the hills as soon as she was addressed. Other men and women of a light-complexioned race are said to have been seen by more venturesome natives who were bold enough to approach the wild mountain district. The United States officer was so impressed that he determined to conduct an exploring party across the centre of the island. But apparently the mysterious white folk had vanished, for the world has as yet heard nothing of his search being crowned with success.

Arabia, however, can with more reason boast of a white tribe. For years stories of such a race have been told in the Persian Gulf, and the Rev. S. M. Zwemer, an American missionary stationed at Muscat, alluded some time ago to 'coffee-house babble in Eastern Oman concerning a mysterious race of light-complexioned people who live somewhere in the mountains, shun strangers, and speak a language of their own.' Various theories have been propounded to explain the fable; but probably the explanation is to be found in the narrative of a journey made in Oman in 1876 by Colonel S. B. Miles, published some time ago in the *Geographical Journal.* Colonel Miles, in the course of his travels nearly thirty years ago, came across a town named Sheraizi in the heart of the Green Mountains. This strange place was perched like an eagle's nest on the top of a great cliff, and was inhabited by a people of lighter skin than the rest of the tribes of the interior. They rarely descended to the plains, and refused to mix or intermarry with the Arabs. Colonel Miles found they were the descendants of a portion of the Persian army which invaded Oman in the tenth century. The isolation of the town and the curious behaviour of its people through so many generations would undoubtedly give rise to exaggerated stories in the bazaars on the distant coast, and in this case the origin of the fable may be regarded as fairly certain.

Unfortunately for the romance of the world it seems practically impossible for stories of this character to have the origins novelists would wish. The world is comparatively small to-day. The trail of the explorer is over every land from Paraguay to Tibet. Forbidden lands are entered; hidden cities exist only in the imagination of the fictionist. In a period when trains run to Bokhara and the Great African Lakes, when the tourist appears at Khartoum, and Lhassa itself is threatened, there is no room for a mysterious white race. Even the Dark Continent is no longer allowed to have its mysteries. The photographer sits on the battered walls of Kano; the Fulani emperors have passed away.

One may no longer believe in the existence of a strange white people in the heart of Equatorial

Africa. Mr Rider Haggard's splendid race are probably only the Ba-hima originally discovered by Speke in south-western Uganda. At least, Sir Harry Johnston claims to have discovered in them the clue to many of the mysterious white race legends found in the Dark Continent. He was engaged in nothing more thrilling than a tour of inspection to Ankole when he came across them. They are of a very light complexion, and are the 'aristocrats' of this region. Sir Harry Johnston says they are 'obviously descended from a Gala, Somali, or other Hamitic stock,' and adds that some of them are more like Egyptians than is the case with Galas and Somalis. Romance disappears before the tread of the explorer. The Dark Continent is dark no more.

FATE'S REVENGE.

A STORY OF THE WAR OF '70.

By CLIVE HOLLAND, Author of *Marcelle of the Latin Quarter*, &c.

FOR weeks previous to the fall of Sedan, which had placed the German armies free to advance upon Paris itself, those living in the country round about the doomed city had been flocking into it with white faces and loud curses upon their lips against the Prussians, who had wrought this great woe. And at length the last batches of the terrified, who had clung to hope outside the walls of Paris with the tenacity of those who will neither believe in defeat as being possible nor admit it when it has taken place, straggled in through the fortifications with carts and trollies laden hastily with what they most valued, with the soldiers of the Crown Prince almost on their heels.

Amongst the last to abandon to the invader their little homestead, which was set back a couple of miles or so from the banks of the Marne, near Villiers, had been old Edouard Crepaux and his wife; and it was not till they had been surprised by a handful of Prussian scouts, and had seen their niece, Jeanette Landry, stabbed through the breast for crying out, '*Vive la France! À bas les cochons Prussiens!*' and watched from a distance, with unspeakable rage, their cottage being burned by the orders of the youthful lieutenant, that they had fled.

All along the dusty road to Paris, where the small body of Badenese as yet dared not follow them for fear of being cut off from their base, old Edouard muttered curses and threats, and Mère Crepaux at his side shed silent tears over poor Jeanette and the grief of her boy Philippe when he should hear the news.

'May they be accursed for all time!' burst out the man as they passed a smouldering pile that had once been a trim villa. '*Ma pauvre Jeanette!* And thou lying with thy white face and blood-stained breast turned up to the sunlight. The fiends! And that white-faced boy did nothing to prevent it. And thou wast to have been a daughter to us at the finish of the war. And now you are a bride of France. Yes, "*Vive la France!*" I too called out, and yet the Prussian pigs would not take any notice of me. Ah! when Philippe knows, he will see that his chassepot misses no Badenese of whom he can get a sight.'

And all the way to Paris old Edouard let fall his curses, and his wife wept on. At sundown they entered the city by the Porte de Charenton amidst a crowding mêlée of fugitives and vehicles crushing into Paris in hot haste on hearing the news of the Prussian advance: children bruised and bleeding from stumbles against the carts or from pushing their way through the brambles in their flight; ladies in carriages, holding their jewel-cases in their laps, or afoot, hatless, dusty, and dishevelled; old men—too old to shoulder a chassepot—stumbling and shuffling along in the heat and dust: a multitude of the useless, whose devouring, hungry mouths could well be spared inside the terrified city.

The tide of humanity swept the Crepaux along the Rue de Charenton, and then down one of the by-streets, where, meeting one of the *garde mobile*, old Edouard inquired for his son.

'Corporal Philippe Crepaux,' said the old man, with a flash of pride adding 'of the One Hundred and Fifteenth Regiment of the Line.'

But the other only shook his head, said he was sorry, but knew nothing of the One Hundred and Fifteenth, and no one—positively no one—named Crepaux.

The old people wandered on. They had left most of those who had entered the Porte de Charenton with them in the main street, and now they felt strangely alone. The people they met regarded them almost with suspicion—so virulent was the spy-mania—or regarded them not at all, being too fully occupied with their own affairs or in reading the latest news.

As they leant against a doorway in the Rue Liber, through the opened shutters of a window they heard a man use a bitter oath and then read out the surrender of Laon. There was no use denying it; these pigs of Prussians were winning. The paper said something about Trochu and the proposed advance, and a victory near Thionville. But who knew that this victory would not vanish into thin air as so many others had previously done? And as they stood there the noise of the thronging

multitudes in the Boulevard de Bercy and adjacent streets, like the low mutterings of an enraged animal, struck them with fear.

'We must be moving on,' exclaimed old Edouard at length; 'we may be even taken for Prussian spies if we loiter. Who knows?' and he shivered.

They started off to make their way to the house of some friends in the Rue des Martyrs. They went along the Boulevard de la Chapelle, which they had found after several inquiries of people who were, most of them, too much engaged in the endeavour to find out if the news of the Prussian advance on Paris were really true to pay much heed to the old man's questions, which were always the same: '*Pardon, m'sieu;* but can you direct me to the Rue des Martyrs by way of the Boulevard de la Chapelle?'

When he heard persons saying, 'Have you heard the news: the Prussians are at Champigny? What is Trochu doing?' he longed to tell them that some Badenese were even at Villiers, and the tears sprang up into his dust-swollen eyes as he thought of Jeanette with the wound in her breast and her white face turned up to the stars. She would never again bring home Frisky from the pasture at sundown for milking, because he had watched Frisky herself being driven off with a lurching shamble of a run at the point of a Badenese bayonet.

They walked on and on till they reached the point where the Rue des Martyrs is intersected by the Boulevard de Clichy, along which, with a rattling, heart-throbbing roll of drums, came a detachment of National Guards, supported by a battalion of newly recruited Zouaves. An immense concourse of people, drawn down from the heights of Montmartre, accompanied them, running alongside the marching soldiers, taking their hands, slapping them upon the shoulders, and cheering them on with cries of, 'Success to the army of Paris! Long live Trochu! Long live Bazaine!' and other cries of more local significance.

Crushed back against the front of a shop, and every now and again almost carried into the vortex of surging, shouting humanity as it swept by them with an uglier rush than usual, stood old Crepaux and his wife, hoping against hope that amongst these brave sons of France so eager to repel the Prussian bayonets they might perhaps catch a glimpse of Philippe.

But it was not to be. For the latter was standing on the ramparts of Paris not a mile from the Porte de Charenton, through which they had passed in with thousands of other fugitives a few hours earlier.

When the last of the Zouaves had gone out of sight, and the roll of the drums had become a spluttering rattle in the distance, the two turned into the Rue des Martyrs, and ere long succeeded in finding the number of which they were in search.

Ariane Primat herself came to the door with a white, scared face, fearing lest it might be her husband returned wounded or perhaps brought home dead. For had not the cries of the street, 'The Prussians near Paris,' rung in her ears all day?

'Oh, it is you, Uncle Edouard, and you, Aunt Marthe!' she cried out.

'Yes, yes, Ariane, and tired out. Surely the Prussians have come at last.'

And the two old folks stumbled into the sitting-room on the ground-floor, and sank wearily into the first chairs which came handy. Then over some bread and *vin ordinaire* placed upon the table in a hurry, Ariane listened to the story of their flight. Her husband, Jules, was stationed near the Porte de Charenton, and she wondered he had not seen them, forgetting the thousands of fugitives who had fled into the heart of Paris since sunrise. Jules had been drawn for service in one of the newly recruited Zouave regiments but a fortnight ago.

Oh, the business! It was dreadful. It was going to ruin fast enough, notwithstanding her efforts to keep it together. But Paris needed her brave Jules, and so he had to go. Maybe he would bring Philippe in with him. He often came.

And these two, when they had listened to the story of the burning of the farm, the stealing of the cow, and the death of Jeanette, would see in future that each shot they fired against those *canailles* the Prussians sped home. Poor Jeanette! And she so pretty and young. It was cruel. But what was to be expected. Prussians were savages. They lived like the pigs they were in their own country. Poor Jeanette, with her face turned up to the sky! Perhaps little Fidele would go and lick her hand, if the Prussians had not thrown her, fluffy hair and all, into the pot already.

They sat chatting for an hour, and then, when the lamp was lighted, a couple of neighbours dropped in and heard the story of the swooping down of the Prussian skirmishers at Villiers. Then, when these had gone home, old Crepaux put on his horn-rimmed spectacles and read the latest news from one of the authorised papers, which put the best face on affairs and spoke hopefully of the proposed action of General Trochu.

At midnight Jules Primat and his cousin, Philippe Crepaux, came in, and the terrible tale was gone over again, whilst Philippe alternately sobbed and cursed. Already inflamed by proclamations couched in hysterical language dictated by despair, by the story of Sedan, and the slaughter at Bazeilles, told him by a man of the One Hundred and Sixth who had miraculously escaped both capture and slaughter, Philippe raged in his despair, and would have seized his chassepot and started for Villiers forthwith had he not been restrained.

All night long he tossed in a frenzy of passion up in one of the fourth-story rooms which had been allotted to him. Why had not the One Hundred and Fifteenth been ordered to march to

Champigny, where the Prussians were now declared to be?

Then he remembered Jeanette—his poor Jeanette, who, when he had left the farm a few months ago, had leant her head on his breast, and he vowed with streaming eyes that he would come back to marry her when the Prussians were beaten back across the Rhine, a sergeant at least, with a bronzed face, fierce moustache, and a jaunty air. Jeanette now lying with her pretty face ashen-gray like the man he had seen lying dead in the gutter near the Faubourg St Denis, where he had fallen, shot as a supposed spy; her hair, in which she had always taken such pride, spread out over the damp earth; her white bodice, against the spotlessness of which he had often watched her heart beating, all blood-stained. At last he could bear the thought no longer, so he got up off the bed and sat playing with the lock of his chassepot, a bullet from which, if God willed, might later on find the brain or the heart of the fair-haired lieutenant who had stood by and seen poor Jeanette slaughtered. Who knew?

And so he sat thinking, in the darkness, till at daybreak the clear, shrill note of a bugle roused him out of his stupor of rage and grief, and warned him that he would have to be going. He crept downstairs softly, and left the Rue des Martyrs in the light of the gray, cold dawn, whilst Paris still, for the most part, slumbered—the city which was soon to be so wakeful day and night with the enemy thundering at its very outworks.

A few days and there no longer came fugitives crushing in at the gates, north, east, west, and south. The girdle of iron which had, a couple of weeks before, closed round Sedan and its encircled host with its irresistible coils, had now surrounded Paris. Paris lay invested, cut off on every side, whilst within her walls every one waited for the sortie which would crush the Prussians back headlong completely, and bring deliverance to the beleaguered city.

For two months Philippe fretted, with his soul in wait for the Prussians. So anxious was he to get but a sight of these butchers that he applied to be transferred to another regiment, so that he might bear a part in the attack on the heights of Sceaux on the 19th of September; but his application was unsuccessful.

Till the 29th of November he endured the torture of a caged animal. Every inactive hour had burned Jeanette's death more deeply into his heart, and he knew no peace till he found himself, on the 30th of November, marching out of the Bois de Vincennes on the way to Champigny, in the gray, half-light of a wintry dawn.

Quite early his regiment got into action and played no inconspicuous part in retaking the village from the Prussians, who were driven out by the terribly heavy fire rained upon them.

At the end of a street, as the Prussians were wavering, Philippe and a handful of his comrades, who had become detached for the moment from the main body, found a shattered wall and a heap of bricks and mortar which had an hour or two before been a smart villa. Between this and the end of the street was an open space, across which small parties of the enemy were every now and then being forced to retreat. Every time a single soldier ran into the open, waving his sword or firing his rifle, he toppled over with a dozen bullets in him. The first he received was almost invariably Philippe's, who crammed the cartridges into his chassepot with a terrible celerity but no haste. He could not afford to miss a single Badenese. Every time one of them stumbled, as the bullet struck him, to crash over with a staggering lurch, or threw up his arms and fell in a heap on the frozen ground, Philippe gave a little grunt of satisfaction, and looked out with smoke-reddened eyes for the next.

For some time no one attempted to cross the fatal oblong strip of ground. Then a great fear entered his mind that there would, for the present at least, be no more work for his chassepot, the breech of which had become so hot that he could scarcely bear his hand on it.

Firing—a volley, then straggling shots, then several volleys on the right—however, gave warning that the Badenese had not been entirely driven from the two or three houses they had hastily fortified with earth and wine-casks filled with clay and soil.

Philippe turned to a comrade who lay stretched full length along the top of the wall, and exclaimed, 'There will be more pigs running across in a minute. Hand me a few cartridges; mine are almost all gone, and I don't want to miss any of the *canaille*.'

'I've none myself,' said the other, with a laugh. 'There goes another;' and a jet of flame spurted from his chassepot as a young officer, sabre in hand, made a dash to cross the open space.

'Missed him!' exclaimed Philippe, with a grin, cramming in a cartridge.

But the young Prussian only ran a couple of paces farther, and then collapsed with a shriek. There was warm work for the next few minutes, and at last Philippe had to spring down off the heap to search the pouch of a comrade who lay at the bottom of it, shot through the head during the first moments of the fight. Another man fell off the top of the wall with a heavy thud; he turned over and sighed twice. Philippe stooped down, felt him, and then unslung his cartridge-box and climbed up again so that he could see what was going on.

Two hundred mètres to the left down the street, every now and again, through the shutters of a half-dismantled house, a jet of flame spurted. It was evident that the Prussians were there, and that he and his handful of comrades would have to be a little more shy of showing themselves. Two or three of the men behind the wall commenced to return the fire from the house, but Philippe had other work. He knocked over three Prussians one

after another as they made a mad dash across the *place*, now strewn thick with their comrades.

A fearful explosion shook the ground, and in the distraction of the moment half-a-dozen Prussians got clear away. Then there was a rush down the street from the direction of which the recent volley-firing had come, and in the mêlée, in which Prussians and a couple of hundred men of the One Hundred and Fifteenth were mixed up, the French were seen to be exterminating their enemies. A smart dash by Philippe and his companions took the last handful of the latter in the rear, and finished the affair. There was now only the house down the street to be reckoned with. That still held out, the little garrison having been, doubtless, strengthened by the score or so of Badenese who had escaped the sharpshooters on the wall.

Covered with powder-smoke, brick-dust, and grime, Philippe and his companions advanced with the rest down the street. Several were hit. One man fell down in the gutter right against a Prussian, and was trampled underfoot by his comrades eagerly pressing on to get at their enemies in the house. One or two men hopelessly in the rear had sprung on to a doorstep or a dead Badenese, and were replying to the fire from the windows of the house, the bullets from their chassepots singing close over the heads of those in front.

Philippe, with a shot through his thigh, was one of the first to batter in the door. There was a rush up a smoke-obscured staircase with soft carpet underfoot. At the head of the stairs were a dozen men with bayonets fixed and pointed down right on a level with the breasts of the soldiers coming up.

Philippe had got pushed away from the staircase in the first rush, and struggled up with those against whom the bodies of their comrades and the Prussians who had bayoneted them, and then been shot by others, came tumbling.

There were still half-a-dozen men alive in the top room overlooking the street when he had forced his way up. One was a young Badenese lieutenant with a sabre-gash opening his shoulder. Philippe glared at him, and then suddenly became aware that he had surely seen him before. Anyhow, he was there to kill all Prussians, so he raised his chassepot and pulled the trigger. At the same instant he felt a crushing blow on his head, and fell into a corner.

When he recovered consciousness he heard soldiers singing down in the street, and crawling to the window, saw a squadron of Zouaves bivouacking in the roadway. His thigh was giving him intense pain, and his head ached as though it were crushed in; but before he went down he crossed the floor to fill up his cartridge-case, and see if the young officer over in the corner farthest from the door carried a flask.

He knelt down beside the body, turned it over on its back, and opened the tightly buttoned jacket. He pulled out a small flask from the inside breast-pocket, and with numb fingers unscrewed the metal stopper and held the flask to his lips. It was good cognac, and seemed to put new life into his body, which was shivering with cold.

There was something else in the pocket; it might be worth having. He put his hand in again and drew out a couple of photographs. With a great cry he hobbled to the window.

One was a photograph, with a dark smear across it, of his dead Jeanette, which he had had taken at the Paris fair the year before last. On the back was hastily scrawled something in German which he could not read, with two signatures at the end, as though the message, whatever it was, were countersigned.

So, after all, that was his enemy who lay over there in the corner with a small hole in his left breast. Now he knew how it was he thought he had seen him before. He would tell his father, if he ever saw him again, what a good description he had given of the murderer of poor Jeanette.

Well, he was glad—very glad—that he had killed him. He would do no more French girls to death, anyway. Jeanette would surely rest now she had been avenged. And he too must rest, and seek the ambulance or *vivandière*, and kill no more Prussians for a time. He was too tired for the latter, and wouldn't be able to shoot straight with the gash in his head, which made him feel so weak and sway about like the pontoons thrown across the Marne. So he pulled the door of the house close after him; and as he staggered along the street to the bivouac of Zouaves he thought of nothing save the dead Prussian and how glad he ought to be that he had killed him.

A SONG OF SEASONS.

I OPENED the gate of my heart full wide
(O the north wind blowing!),
When Spring came up the lone burnside
With fair, new hopes for sowing.
O'er daffodil gold of the careless Spring.
And tender wheat upspringing,
There came to me on the western wind
The sound of a wild-bird singing.

I kept my hope through the sunny days
(Southland winds a-blowing!),
When Summer lingered along the ways
To see her roses growing.
Where scents of the meadowsweet drifted on
Between the flowery hedges,
The wild duck's brood slipped in between
And scarcely stirred the sedges.

Garnering comes with the Autumn hours
(O hey! the wild winds blowing),
Yellowing grain and fading flowers
Repay the bygone sowing.
Though faring home with the gathered sheaves,
See how the gains bereave us!
Where wild-birds sang in the merry Spring
We watch the swallows leave us.

THE WOODCOCK.

By GEORGE BOLAM, F.Z.S.

W ithin the spruce's friendly shade he lies,
O n mossy fern-grown bank, while shines the sun
O 'erhead; but when the owl-light comes he flies
D own open glades, whence these are called by some
C ock-shots, and to the flooded fields he hies
O n worms, and maybe worse, to gorge him. H'm!
C ould we, who cook and serve him up *in trail*,
K now all he eats, methinks 'twould make us quail!

THE author of the above old-fashioned acrostic was well acquainted with the habits of the woodcock, for it would be difficult even in prose to more succinctly describe his general mode of living. His large, full eye, so well adapted to catch the faintest rays of light, marks him at once as essentially a crepuscular feeder, and the greater part of his day is spent in dozing quietly in thick covert. As soon as twilight comes on, however, he is all activity, and many a summer evening have we watched him toying with his mate upon the wing round the outskirts of some large wood, or chasing a rival down its open rides. At such times a faint squeak is often emitted, as well as a sort of clucking note, and the wings are frequently brought together above the back with a loud clap; but otherwise the woodcock is a very silent bird. In olden days the sportsman or the poacher used to station himself towards nightfall near these open glades to shoot the woodcock as he passed down them, and hence the name 'cock-shots' came to be applied to them, a name which, from the same cause, is sometimes used also, in sporting parlance, to signify twilight. In still earlier times woodcock used to be taken in nets hung across these open places in woods so as to intercept their flight; and the practice of shooting them in such places is still, we believe, carried on in some parts of Norway and the Continent where they breed. The idea that woodcock fed only 'on suction,' so implicitly believed in by our forefathers, has long since been exploded, though it was not long ago well enough accepted to have given rise to the adage, in reference to people addicted to the bottle, that they soon become 'fat as a woodcock by suction.'

There is probably no bird upon our game-list which is more eagerly sought after than the woodcock, or more prized alike for the sport he affords before being brought to bag as for his kitchenable qualities afterwards. Until within recent years perhaps 'the chance of a shot at wild-duck' may have run close upon 'the chance of a cock' in the mind of the ardent sportsman; but since the practice of artificially rearing the former fowl has become so common as in some places almost to rival the pheasant in that respect, the difficulty of being able to add a mallard to the day's bag has so much diminished as undoubtedly to rob the feat of much of its erstwhile prestige. It was rather the uncertainty of finding the duck, as well as his undoubted wildness, that marked him as such a much-prized addition to the bag; for in most circumstances the shot afforded by a rising mallard is by no means a difficult one. But with the woodcock how different it is! Man has not yet succeeded in controlling his erratic will, and inducing him to put in an appearance when wanted in the covert, and probably never will succeed in doing so; and who would wish to curb his twisting, rapid flight through the trees, which makes him so difficult a shot to the tyro? When there are woodcocks in the country there are always a few favoured spots where one may generally be met with; but there are few birds which can be looked upon as such glorious uncertainties. He is here to-day and gone to-morrow, often without apparent cause; and with every change in the weather, and often without it, he is as likely as not to shift his quarters. But though we may not be able to control the movements of woodcock, there are several little ways in which places and coverts may be made more attractive to them; and where considerable sums of money are annually spent in the endeavour to improve shootings, it may be quite worth while experimenting a little in this direction, more especially in localities where the birds naturally resort upon their first arrival in the country. Although they like 'soft' places to feed in, woodcock are fond of thick, dry covert to lie in

[*All Rights Reserved.*]

during the day, no place suiting them better than an old wood in which the trees, while shady enough to exclude the direct rays of the sun, are yet far enough apart to allow heather or other undergrowth to flourish beneath them. A damp rather than a wet situation is what they prefer, and the richer the soil the more worms, *et hoc genus omne*, will it contain, and the more attractive it will be to woodcocks. At night they forage over a wide tract of surrounding country in quest of earthworms and other like delicacies, visiting fields of roots and many other unsuspected places. Land capable of growing good oak-trees will generally be found favourable to them, and there is no covert to which they are more partial than that afforded by holly-bushes and the spruce-fir, more especially the latter. What it is that makes spruce so particularly attractive to them has never been satisfactorily explained; but the fact remains that in going through a mixed plantation of firs and hardwood trees, or even one of firs and pines, it will be found that in nine cases out of ten it is from the shelter of a spruce that the woodcock rises; and when there is sufficient snow upon the ground to enable the footprints of the birds to be traced, their partiality for that tree is still more evident. In a covert to which it is hoped to attract cock, a liberal allowance of spruce or some of the allied firs should be planted, and it may be remarked in passing that there are no trees which afford better shelter than these to birds of all kinds, from pheasants and wood-pigeons down to the humble and diminutive golden-crested wren, or none that are more appreciated by them.

Although the number of woodcock which remain to breed in this country has undoubtedly increased considerably of late years, the great bulk of those shot in our coverts during the winter months must still be regarded as immigrants from abroad, arriving from about the beginning of October, and taking their departure early in March, by which date many of them have already paired. Previous to the passing of the Wild Birds Protection Act, which makes it illegal to kill woodcock after the 1st of March, considerable numbers used to be shot at this season, and there is no doubt that the protection thus afforded has been the means of inducing many more pairs to remain and nest with us than used formerly to be the case; while the increase of game-coverts and plantations, especially those composed of firs, has also doubtless very materially assisted in this direction.

The densely wooded tracts of Norway and Sweden and the north of Russia are the chief breeding-stations whence our annual supply of woodcock is derived; but they nest also through the forests of central Europe as far south as the north of Italy, and penetrate northwards even to beyond the Arctic Circle, probably to the limit of tree-growth. The date of their arrival in this country, as well as the numbers in which they appear, depends much more upon the severity of the weather in their breeding-haunts than upon any climatic influences obtaining here; but in a general way the first flights may be looked for upon our eastern coast early in October, and it has been supposed that the birds prefer hazy weather, with a moderate wind from the north or north-east, for their journey. That their arrival was frequently about the time of full moon was taken by our ancestors as sufficient proof that they must have passed the summer in that planet. Thus Gay, in the *Shepherd's Walk*, says:

> He sang where woodcocks in the summer feed,
> And in what climates they renew their breed;
> Some think to northern coasts their flight they tend,
> Or to the moon in midnight hours ascend.

And we find the Rev. Charles Swainson, in that most valuable work, *The Folk-Lore of British Birds*, quoting another reason for this extraordinary supposition from a tract contained in the *Harleian Miscellany*, 'An Inquiry into the Physical and Literal Sense of that Scripture: "Yea, the stork in the heaven knoweth her appointed times; and the turtle and the crane and the swallow observe the time of their coming" (Jeremiah, viii. 7).' The author thinks that 'if storks and other migrating birds winged their flight at their periods of migration in a horizontal direction, they must have been observed by travellers;' therefore he argues 'that the stork—and the like may be said of other season-observing birds, till some place more fit can be assigned to them—does go unto and remain in some one of the celestial bodies, and that must be the moon, which is most likely because nearest and bearing most relation to this our earth, as appears in the Copernican system; yet is the distance great enough to denominate the passage thither an itineration or journey.' That the writer was not unacquainted with the habits of woodcocks is shown by his further remarks that 'in them it is remarkable that upon a change of the wind to the east, about All-hallows tide, they will seem to have come all in a night; for, though the former day none are to be found, yet the next morning they will be in every bush. I speak of the west of England, where they are most plentiful.' And he proceeds to state that two months were probably occupied by the birds in their flight to the moon, a like period upon the return journey, and three months spent by them in the lunar world.

The actual flight from the coast of Norway is probably performed by the birds in a single night without any undue exertion, and on their first arrival in this country they are invariably found to be fat and in high condition, a state common to most migratory birds at that season of the year. That they should prefer the wind behind them for the journey needs no explanation, and that they should so often arrive in foggy weather is probably due rather to the prevalence of mist at that season of the year than to any preference the birds can have for travelling in a fog. But though woodcock generally arrive during the night, this is not a universal rule, for it has more than once been our good

fortune to witness their incoming during daylight. Thus, one day in November, a few years ago, when we were shooting through some young fir-woods within three or four miles of the Northumbrian coast, woodcock were conspicuous only by their entire absence during the morning; but on going over a part of the same ground again later in the afternoon we found the woods full of them, and actually saw one or two of the birds arrive, descending like snipe from high altitudes, and pitching in amongst the trees around us. One cock, coming thus suddenly from the clouds, so to speak, was met ere he gained the shelter of the fir-trees by a sparrow-hawk, which was joined almost immediately by another hawk of the same species; and when last seen the three birds were disappearing like lightning down a ride in the wood, the hawks being close together, one a little above the other, and following all the twistings of the woodcock like greyhounds coursing a hare. Of the fate of the woodcock on that occasion no evidence was forthcoming; but in the same woods at other times we have occasionally come upon the remains of cock which had been eaten by hawks; and from the fact that whenever there is any considerable arrival of cocks in these woods there are often also one or two sparrow-hawks present, we are inclined to think that the hawks probably arrive with them from abroad, this belief being further strengthened by the fact that the hawks are generally of a colder and clearer blue colour above, with the thighs and flanks of a richer orange, than in our native-bred birds. When shooting through these woods on 2nd December last, the brother of the writer and a friend bagged twenty-seven woodcock and a sparrow-hawk, the latter a beautiful adult male in the state of plumage just referred to. The woodcock on this occasion had arrived during the previous night, and that they had come oversea was apparently proved by several having been caught on the Farne Islands, only some six miles distant as the crow flies, while two others had been captured that morning in a stable in the village of Beadnell upon the adjacent coast. But—and here a rather curious question arises—amongst the twenty-seven woodcock shot there was one having a brass ring upon his leg, which proved him to have been bred in the Duke of Northumberland's Park at Alnwick during the previous summer! Where he was shot is perhaps nine or ten miles from Alnwick, and he may, of course, never have strayed far from the place of his birth; but as woodcock are very seldom seen near their nesting-places with us after the young are fledged, it is open to conjecture whether he may not have had an extended flight somewhere in the interval, and taken up with and returned again with the migrating flock.

> If the partridge had the woodcock's thigh,
> 'Twould be the best bird that e'er did fly.
> If the woodcock had the partridge breast,
> He'd be the best bird that e'er was drest.

It may probably be news to many people to learn that the above well-known lines are as old as the time of Willughby (1688); but that the woodcock was not always held in such high esteem by the epicure is shown from the Earl of Northumberland's *Household Book*, where, in the early part of the sixteenth century, the price of a woodcock is stated to be one penny—or three-halfpence—less than that of a golden plover. In the reign of Queen Mary, however, we find the Scottish Parliament fixing the price of 'woodde-cokke' at four pennies each.

The curious fact that some dogs will scarcely touch, and will not carry, a dead woodcock, though they will readily enough hunt up the bird while alive, is well known to sportsmen, and has been reduced to verse by some one, though we cannot recollect whom:

> So my hounds will eagerly the living woodcock flush,
> But in death disdain him.

As prognosticators of the weather, the woodcock vies with such birds as the cuckoo and the swallow in ancient lore. Thus, 'One swallow maketh not summer, nor one woodcock a winter,' is a proverb at least three hundred years old; while the fact of his not coming to us in autumn until all hay is, or ought to be, safely in stack, nor the cuckoo in spring until all corn ought to have been sown, has given rise to the proverb:

> Cuckoo oats and woodcock hay
> Make the farmer run away;

a similar maxim being expressed by our neighbours on the north side of the Tweed in the lines:

> He 's nane but a judcock teds hay in October,
> An' a gowk wha saws yets when the cuckoo 's come over.

From the time of Shakespeare woodcock has always been synonymous with fool, owing to the ease with which the bird used to be taken in springes and gins; and no doubt judcock, though the name is more commonly applied to the jack-snipe, is here intended to refer to that bird, while gowk is also *Scotticè* for a daft person as well as a popular name for the cuckoo. 'Cuckoo yets ne'er fill the barn' is another kindred saying, 'yets' being, it is perhaps needless to explain, the Border rendering of oats.

Phillips tells us that

> The woodcock's early visit, and abode
> For long continuance in our temperate clime,
> Foretells a liberal harvest;

but we can scarcely say that this applies much to our country, unless it be intended to signify that a good woodcock winter (generally a hard one) is to be followed by a good summer—a popular belief of long standing now well-nigh exploded.

Another description of the bird, which is perhaps more humorous than strictly accurate, we find in *Turner on Birds*, written in 1544, and lately translated by Mr A. H. Evans, where, under 'Wodcok,' we are told that 'it runs with speed; while it is wonderfully fond of man;' the fondness being, we should have thought, rather upon the other side!

The late Sir Francis Chantrey made two woodcocks famous by killing them at one shot at Holkham, in Norfolk, in 1829, and afterwards perpetuating the event by carving the birds in marble; the singularity of the occurrence giving rise to so many epigrams and complimentary verses that they sufficed to fill a small volume published by Mr J. P. Muirhead, entitled *Winged Words on Chantrey's Woodcocks*, in which no fewer than one hundred and seventy-nine of these poetical effusions were collected together. Of these, perhaps the following are the best known and most often quoted. The first was written by the late Mr Hudson Gurney, the latter by the then Bishop of Oxford:

Driven from the north, where winter starved them,
Chantrey first shot, and then he carved them.

Life in death, a mystic lot,
Dealt thou to the winged band;
Death—from thine unerring shot,
Life—from thine undying hand.

Two cocks have often, no doubt, since then fallen to the same shot; but the following curious incident, which happened within our own knowledge in north Northumberland a few years ago, may be worth telling. Mr R. W. Maling of Twizell House was one day ferreting rabbits on a mossy bit of ground alongside a rushy stream, when, while he was sitting on the bank waiting for bunny to appear, a woodcock rose from the rushes in front of him, and he shot it. By-and-by, when the ferreting was over, he walked over to where he had marked the bird fall and picked it up, his man at the same time going to the spot where *he* too had marked the cock down, and also gathering his bird. Two woodcock had evidently risen simultaneously, though at a considerable distance apart, and been killed by the same shot; and each man had seen only one bird, and had carefully marked its fall!

Another almost equally funny episode in woodcock-shooting happened only a year or two later, when several gentlemen, including the father of the writer, were shooting in Trickley Wood, upon the Earl of Tankerville's estate, in the same county. A strip of covert had been almost beaten out, and the guns were standing pretty close together round a last clump of rhododendrons, into which several pheasants and a couple of woodcock had already fallen dead. When the keepers and beaters came up, and men and dogs went into this last clump, alike to beat it out and to recover the dead game, out bolted a fine fox with one of the woodcock in his mouth, and in spite of shouts and laughter, and threatening gestures of sticks, actually broke through the crowd and went off with his ill-gotten prize!

Well may we remember the saying of an old friend, that 'funny things often happen in fishing and shooting;' but fact is often so much stranger than fiction that one is almost afraid to tell the best of them!

GIANT CIRCUMSTANCE.

CHAPTER XII.—THE CURE WORKS.

DOWN at Gosport the *Seamew* chafed restlessly at her anchor-chains, and Captain Bannatyne paced her snowy deck and hungered for the telegram that never came. He had been ready for sea any time this last fortnight, only his passenger was lacking, and Bannatyne, good-natured soul though he was, inclined at last to mild vituperation at his dilatoriness.

But Geoff was recuperating—inwardly at all events—in a very different way, and until he had his new hobby at least on to its feet he would not allow himself that other relaxation which, bodily at all events, he was mightily craving. For, though one may come through the wear and tear of a hot-country campaign as hard as a board and apparently as tough as leather, when the work is over and the strings are loosened one is apt to feel the effects, and Geoff was beginning to feel them now.

And so it came that one day Bannatyne's long expectation was gratified. 'Shall be with you to-morrow,' said the telegram, and in his exuberance of delight he gave the boy half-a-crown for himself, which the young sinner spat upon for luck and then dissipated in cigarettes and other riotous living.

And on the joyous morrow, to the *Seamew* lying expectant, with half-expanded wings ready for instant flight, came out a shore-boat containing a tall, brown young man of military bearing, and an imp in sailorly blue, with a white face and black beads for eyes, and what he called a game-leg, and a modicum of baggage.

'Captain Carrick,' said Bannatyne, with a military salute, 'I'm mighty glad to see you, sir;' and his face showed it.

'And I'm mighty glad to be here, Bannatyne,' said Geoff, with a large smile at the other's up-to-dateness; for he had only been gazetted three days before, and his new patronymic still felt strange to him.

'This is a little friend of mine who has had an accident. I thought a sea-trip would do him no harm.—Now, captain'—to the beady-eyed, stiff-legged one—'you sit there and pick up an appetite.'

'Got one,' said the small boy pointedly.

'Well, see you keep it,' laughed Geoff.

'Anything more to come, sir?' asked Bannatyne.

'Nothing, captain. Let her go!' and the *Seamew* nosed up to her buoy and gave it a flying kiss, the white wings spread themselves joyfully, the little ship bowed a graceful adieu to the shore, thrilled through her length with the rapture of freedom,

shook off the smell of the land, and sped away towards the Channel.

'Bless my buttons!' said the beady-eyed one, as he clung to the brass ribs of the skylight. 'If this ain't something like!'

Up in London they had had a busy fortnight while the *Seamew* chafed at her buoy. A ramble through Captain Dick's district discovered premises capable of adaptation to the requirements of the case. The knocking down of some dividing walls would give them all the space they wanted at present for a drill-hall. The rooms above would make capital club-rooms and still leave space for a care-taker and his wife, whose post was like to prove no sinecure. Then there was a great attic just under the sky, and Geoff saw at a glance what that was meant for.

'Band practice,' said he, and that settled it.

'I've got just the man for commandant, and he's got just the wife,' said Trevor. 'Old Don Connacher. The General knew him. You've heard us speak of him. He was through the Mutiny and the Crimea. Got a breastful of medals. Those boys'll worship him. He's retired sergeant, and a most excellent soul; and so is his wife. If anybody can keep these young cubs in order, he can.'

'He's our man,' said Geoff. 'Perhaps you'll see him, colonel, and book him at once. Whatever terms you fix will be right.'

'He'll jump at it;' and he did, and so, metaphorically speaking, did his wife; and if they had raked through the ranks of the retired with a fine comb, they could not have found a better pair for the post.

Then there were interviews on the spot with builders and painters and fitters-up of gymnastic apparatus, and all day long there were small boys hovering about the door and trying to peep in. For Captain Dicky Bantam had been consulted on his unwonted bed, and he knew that building from the attic down to the back basement window. 'You just slips in your knife, and there you are,' was Dicky's explanation of his intimacy; and through him the news had got abroad, and all his gang, and even the Prussia Street gang, were all agog to sign on as soon as the roll was opened.

Dicky had been for ostracising the Prussia Street gang; but five minutes of Geoff's good-humoured argument turned him inside out, and widened his purview, and let light into a by no means naturally dark little mind.

Geoff found immense enjoyment in the development of his schemes. All the same, he was feeling the need of a change and a brace. There was a heap of Soudan in him still, he averred, and nothing but sea-spume and spindrift and chill northern mists would soak him back to normal. And was not the *Seamew* gnawing her anchor-chains down at Gosport and Bannatyne chafing for lack of him?

And so, as soon as he saw things well under way, he packed a portmanteau for himself, bought one for Dicky and stocked it with things which he considered necessaries, but which Dicky regarded as superfluities, and carried that young man off with him to Gosport and his first revolutionary experiences of seafaring life.

Colonel Trevor found the new departure very seductive also. Geoff had urged his friend to come with him overseas, but the colonel pleaded a proved incompatibility between slippery decks and a wooden leg, and between his internal organisation and blue water generally, and maintained that there was no place like London even in July and August. And, as Brading's shoulder was still only piecing slowly, Geoff left him with Trevor as his right-hand—or, as Trevor put it, his right-leg—man, to run his errands, do his bidding, and further matters generally.

A complexity of emotions—to say nothing of a perfectly new and somewhat disturbing sensation, which presently attacked him about the lowest button of his new waistcoat, and climbed steadily, button by button, up into his throat—choked Captain Dicky Bantam into unwonted silence, and he was content to lie absorbing wonders such as he had never even had the chance of dreaming of. The dainty neatness of all his nearer surroundings—spotless deck, brass-work like gold, paint and varnish as fresh as if they had only been laid on five minutes ago, white ropes coiled so beautifully that it seemed a shame to disturb them. The piles of snowy canvas above, swelling and straining with the might that was in them. More blue sky than he had ever seen in his life. Rolling blue waves with little white night-caps galloping in from the end of the world on one side, and racing to leap at the far-away land on the other. Stately ships sweeping along slowly and precariously, disappointing only in the fact that they kept right-side up with so much sail and so little hull. Dicky's ships on the Serpentine, with nothing like so much sail in proportion, usually completed their voyages bottom upwards. Mighty steamers churning masterfully along against wind and wave. If only the other fellows could have seen him, Dicky Bantam, lying there enjoying all this! I do not think he particularly wanted them there. But if only they could have seen him, Dicky Bantam, enjoying it all like a lord, his cup would have been full. However, other matters of a personal nature—to which Dicky never referred when he got back—occupied his attention before long, and by the time he was in condition to tackle something more tempting than ship's biscuit, the *Seamew* was winging lightly along the Norfolk coast. And presently she sped away into space, and flitted on and on, with nothing to be seen but sky and sea, for so many days that Dicky lost count and began to fear they had lost their way, or that the place they were supposed to be bound for had sunk out of sight.

Then one morning, when he crawled on deck, he sat down suddenly with hanging jaw and gaped helplessly at the crushing wonders of the Norwegian mountains.

'Well, Dicky, how's that?' asked Geoff, as he and Bannatyne came on the stricken one in their morning walk.

But Dicky only wagged his head helplessly, and gazed fearfully, and finally jerked in an awed whisper, 'Be they fixed tight?'

'They're all tight, Dicky. They've been there a long time. I don't think they're likely to fall to-day. Sight, aren't they?'

'Bless my buttons!' whispered Dicky.

They spent a fortnight among the fiords and islands, and Dicky came to be on quite familiar terms with glaciers at a distance. But he was painfully aware that the fellows at home would never believe him when he told them about these wonderful things, and that was the only spot on his sun.

He could use his leg again by this time, with strict injunctions to carefulness, and there was no part of the yacht with which he was not on terms of intimate acquaintance. The men enjoyed his spirited rattle. Rumour had it that he had been out in the Soudan with Captain Carrick and got wounded there, and I am sorry to say Dicky thought so well of the notion that, far from contradicting it, he did his best, in a negative and non-committal way, to strengthen it. Whereby he gained much unmerited renown, and some warm quarters of an hour out of which none but an unusually nimble-witted one could have issued with unshrivelled plumage.

Carrick, to give him the name which Bannatyne's constant usage was beginning to make familiar to him, was enjoying his holiday immensely. He found Bannatyne's canny, long-headed common-sense very soothing, and they became great friends. He discussed the rearing of lion-cubs with him at length, and Bannatyne urged upon him the idea of a marine branch of the scheme, maintaining to his face, and proving his point by irrefutable argument, arranged under heads and divided into points and supplemented by copious illustration, that, as a man, a sailor was worth two soldiers anyway. And Geoff promised to discuss the idea with Exmoor when he got back.

They turned their backs on the giant cliffs and wonderful fiords at last, and headed out into the Atlantic, and came down on Shetland, and so round Cape Wrath to dally among the Scotch mists and the Western Isles. And so, in due course, to another white milestone in Geoffrey Carrick's life.

They flitted leisurely down the rugged coasts of Sutherland and Ross, then across to Lewis, and came thrashing back across the Minch in a furious north-easter, from which they escaped into the open arms of a friendly loch without an idea as to their whereabouts, except that they lay in safety at a good anchorage. For they had crept in just as the light was falling, and they dropped anchor as soon as they felt the protection of the hills and could breathe freely without danger of being blown inside out.

When daylight came they were shrouded in thick, white mist, in which Carrick found huge enjoyment as being in every possible respect the absolute antithesis to the Soudan. He vowed he could feel the last of the dust and ashes working out of him with every breath he drew, and it was exactly what he had been longing for, for the last six months.

On the second day, towards sunset, the wind began to blow from the south-west. The thick white curtain thinned suddenly and resolved itself into a rout of fantastic whorls and coils, a flying army of tattered ghosts which drew silently away up the glens and corries, and clung reluctantly to the hillsides as though loath to yield a single tree. The bristling ridges stood out one by one in high relief; then, as the trailing skirts passed away behind, they lapsed and fused again into one mighty bulk of solid greenery.

Then the setting sun shone out and winked cheerfully at them from the windows of a gray castellated building at the head of the loch, and Geoffrey Carrick stood gazing at it with an enjoyment that had in it something of longing.

Great fir-clad hills, dark green, gray-green, with warmer bands of russet bracken and purple heather, humped themselves boldly round the far end of the loch, giant guardians of sanctuaries more remote. And presently they caught glimpses of these between the crowding giants—vague bulks below, all wrapped in plum-coloured bloom, elusive, intangible; and up above, hoary gray crowns swimming softly in the warm red gold of the setting sun.

'Wonderful! very wonderful!' breathed Carrick, as though a breath too loud might cause it all to vanish again. 'We've seen nothing more beautiful than that, Bannatyne,' he said, as the golden crowns began to harden into gray.

'It's pretty,' admitted the cautious one, 'but gey lonesome, I'm thinking.'

'That's its beauty, man. Now, that's my idea of a retreat. Right out of the world. Nature pure and uncontaminated.'

'Ye'd tire of it,' said Bannatyne didactically.

'Possibly, if one lived there all the year round. But as a holy place—away from the stress and strain of life—where one could get outside things and view them from a distance, and weigh them in the balances and come at their proper values'——

'Ay, ay!' said Bannatyne. 'Ye'd be well out of things if ye lived there.'

The gray house, which, as far as they could see, was the sole redemption of the scene from utter loneliness, was very cunningly placed on a precipitous rock which looked as though it had fallen from one of the nearer hills or had been playfully outcast by the giants behind. The rock stood out boldly into the sea; the gray house nestled among the firs and undergrowth with which it was clothed.

'I believe it's an island,' said Carrick.

'Shouldn't wonder,' said Bannatyne. 'I was never in here before.'

'What do you call this place?'

'Innismohr, from the chart.'

'We'll wait till morning, and then row over and have a look at it.'

And in the morning they pulled across to the rock, and all round it; and seeing no sign of occupancy, found a landing-place at the back, and climbed up through terraced gardens to the house itself. It was locked and shuttered, however, and they had to content themselves with the outside and the situation of it, which Carrick averred he had never seen equalled.

There were cottages on the shore at the extreme head of the loch, which the house and rock had hidden from them, and they paddled across, but got nothing for their pains; for, beyond some black-headed youngsters, barefooted and shy and slimly clad, and an old woman whose language they could not understand, they found no one there.

So back to the *Seamew*, and up with the sails, and away to the south, with the beauty and solitude of Innismohr fixed indelibly on Geoffrey Carrick's mind, and little thought that he would ever come to know it more intimately.

(To be continued.)

REGIMENTAL TRADITIONS.

By Horace Wyndham.

THE history of Great Britain is largely the history of the British army. Every regiment has contributed thereto, some more than others; but all have done their share in building up the Empire's power and wealth. Perhaps the two corps with the longest list of 'battle honours' are the King's Royal Rifles and the Rifle Brigade. The former of these has earned thirty-four and the latter twenty-nine. When first raised, in 1755, the King's Royal Rifles were known as the 62nd Royal American Regiment. Their present title was not conferred until 1830, and during the interval they answered to three others, for there was just as many chops and changes in military administration then as there are now. In their early days the green-coated, hard-fighting riflemen saw a good deal of active service in America, and it was on account of their gallant conduct at the capture of Quebec (when they won the heart of the heroic Wolfe) that they were granted the motto 'Celer et Audax.' Ever since then—in Spain, India, Afghanistan, China, Egypt, and South Africa—they have more than lived up to this. The late Duke of Cambridge was colonel-in-chief of the regiment for many years, and the present colonel commandant is Sir Redvers Buller, V.C. The Rifle Brigade, which wears a very similar uniform (dark green with black facings), was formed in 1800. For more than a hundred years it has been fighting well-nigh all over the world, from Copenhagen to Cape Colony. In the recent Boer campaign the brigade distinguished itself in an exceptional manner, one of its officers winning the first Victoria Cross granted during the hostilities. This was Colonel Congreve (then a captain serving with the Ladysmith Relief Force), who received the coveted decoration for a brave attempt to save the life of Lieutenant Roberts at the battle of Colenso.

In connection with the different rifle regiments of the British army (four in number), it is interesting to note that none of them carry colours. All other infantry corps, however, are provided with two sets. These are known respectively as the 'royal' or 'king's' colour, and the 'regimental.' The former of these is of the same pattern throughout the service—namely, the Union-jack on a ground of blue silk; the latter, on the other hand, matches the facings of the regiment concerned. Thus for 'royal' ones it is blue, while for other English ones it is white; but with Scotch and Irish corps it is respectively yellow and green. The only exception is in the case of the East Kent Regiment, where it is buff. One corner of the 'regimental' colour has the blue Union embroidered on it, with a wreath of roses, shamrocks, and thistles in the centre, surmounting the title, crest, and motto of the corps. Round this wreath are emblazoned the various campaigns in which the regiment has taken part since its formation. In English battalions of the line the St George's Cross appears in red on a white ground. The colours in every case are made of silk, three feet nine inches in length by three feet in breadth, the edges being fringed with gold. They are mounted on a staff about eight feet six inches in length, from the top of which hang two cords of twisted gold and crimson ending in tassels. In the cavalry, 'standards' or '*guidons*' take the place of 'colours.' These are made of crimson silk, slit up the centre—something like a pennon—and are embroidered with the regimental crest and 'battle honours.' Lancer and hussar corps, however (as well as rifles, artillery, and engineers), are not provided for in this way at all.

It is only in 'military' novels written by imaginative young ladies and in melodramas that colours are taken on active service nowadays. The last occasion when they were carried on a battlefield was during the Zulu war of 1880. It was during this campaign that a memorable feat was performed by an officer of the South Wales Borderers, who, when its capture was threatened by the enemy, cut the colour entrusted to him from its standard and wrapped it round his body. He was afterwards found lying dead in the Tugela River, with the precious silken folds still in his possession.

To the average Londoner the different regiments of Foot Guards are familiar enough. Few, however,

would probably be able to tell off-hand a Grenadier from a Coldstreamer, or a member of the Scots Guards from one of the Irish Guards. This is because they all wear so similar a uniform that it takes a trained eye to distinguish between them. The variations are for the most part confined to the arrangement of the buttons on the tunics and the colour of the busby plume. Thus the Grenadiers have their buttons arranged at regular intervals, the Coldstreams in twos, the Scots Guards in threes, and the Irish Guards in fours. With regard to plumes, the Scots Guards have none at all (and are thus easily recognised), while the Coldstreams have red, the Grenadiers white, and the Irish Guards green. This last regiment is one of the youngest in the British army, as it was only raised three or four years ago.

The London quarters of the different Guards battalions are at Wellington Barracks, at Chelsea, and at the Tower. The first-named establishment extends along the south side of the Birdcage Walk in St James's Park. It has been in military occupation continuously since 1814. Some ten years prior to this date, however, an armoury was erected on the same site. The chapel in the west corner was not opened until 1838. It contains numerous memorials of members of the brigade who have fallen in action, together with several shot-torn flags and standards captured by the great Marlborough on the field of Blenheim.

In addition to the Foot Guards, the permanent garrison of London invariably includes a proportion of the Household Cavalry. This consists of three regiments: the 1st and 2nd Life Guards and the Royal Horse Guards (always known, by the way, as 'The Blues'), quartered at Knightsbridge and Albany Street, Regent's Park. Like the Foot Guards, these corps are primarily intended as a bodyguard for the Sovereign's person, and are accordingly not really eligible for active service abroad, although a composite force, recruited from each regiment of the Guards, was employed for active service in South Africa. This exemption (to which the Scots Greys are also entitled) was originally accorded as a privilege, and as such was highly valued. Of late, however, and much to the satisfaction of all concerned, the custom has been broken through.

Although the Household Cavalry is such a *corps d'élite*, members of the rank and file have succeeded from time to time in winning their way up to commissions in it. Perhaps the most remarkable case on record was that of a young tanner's apprentice and ex-charity-school teacher named John Elley. Enlisting as a trooper in 'The Blues,' he distinguished himself so greatly in Wellington's campaigns against the French that he was promoted cornet. He died, in 1839, Lieutenant-General Sir John Elley, K.C.B., member of Parliament for Windsor, and was buried in the Chapel Royal.

While we are on the subject of commissions from the ranks in the old days, the notable record of John Shipp deserves to be mentioned. This man began life as a workhouse-boy, and went out to India as a private soldier in the Cheshire regiment. For exceptional gallantry at Bhurtpore he was given an ensigncy in the 65th Foot. In 1808 he returned to civil life. Almost immediately afterwards, however, he enlisted again (this time in a cavalry corps) and went back to India. After a few years' service in the East he rose to be an officer once more, thus obtaining two separate commissions before he had passed his thirty-first birthday. His subsequent career, however, was rather chequered. Thus, while quartered at Calcutta, he was court-martialled and cashiered for reflecting adversely upon his colonel. With a small pension which the East India Company granted him, he settled down in London and essayed fame as an author. He then became a police-inspector at Stepney, an appointment which he resigned later on in favour of the mastership of the workhouse at Liverpool.

Of the origin of the Household Brigade an interesting picture is drawn by Macaulay: 'The little army formed by Charles II. was the germ of that great and renowned army which has in the present century marched triumphant into Madrid and Paris, into Canton and Candahar. The Life Guards, who now form two regiments, were then distributed into three troops, each of which consisted of two hundred carabiniers, exclusive of officers. This corps, to which the safety of the King and Royal Family was confided, had a very peculiar character. Even the privates were designated as "Gentlemen of the Guard." Many of them were of good families, and had held commissions in the Civil War. Their pay was far higher than that of the most favoured regiment of our time, and would in that age have been thought a respectable provision for the younger son of a country squire.'

The cavalry, judging by the state of the recruiting-market, is undoubtedly the most popular in the whole service. It consists of thirty-one regiments. Of these, three are Household ones, twelve hussars, seven dragoon guards, six lancers, and three dragoons. At one time the mounted branch was divided into two classes, 'heavy' and 'light.' Nowadays, however, this distinction no longer obtains. Dragoon regiments (except the 6th Carabiniers, who wear blue) are clothed in the historic scarlet. Hussars and lancers, on the other hand (except the 16th Queen's), wear blue. Only one cavalry corps is Scottish—the 2nd Dragoons (Scots Greys); the Irish ones are four in number: the 6th Dragoon Guards, 6th Dragoons, 5th Lancers, and 8th Hussars; and the remaining twenty-six are English. They are all distinguished from one another by peculiarities in the way of head-dress and uniform. Thus the Household Cavalry and dragoons have metal helmets and horsehair plumes, lancers have 'caps,' and hussars have busbies. The Scots Greys, however, wear bearskins. A specially attractive dress is that of the 11th Hussars,

easily recognised by their crimson 'overalls.' This distinction was bestowed on the regiment in commemoration of its gallantry in a certain action where the men are reported to have waded up to their knees in the enemy's blood! At any rate, this is the generally accepted theory.

Nearly all the mounted corps—like the unmounted ones—rejoice in nicknames. The most famous of these is the 'Death or Glory Boys' of the 17th Lancers, a fitting accompaniment to the regiment's grim skull and cross-bones crest. Raised in 1759 as the 18th Light Dragoons, they were converted into lancers in 1823. The 10th Hussars are known (in recognition of their exclusiveness) as 'the Chainy Tenth,' while the 11th Hussars are equally proud of being called the 'Cherry-Pickers.' Then the 14th Hussars are nicknamed the 'Ragged Brigade,' and the 7th Hussars the 'Saucy Seventh.' The 5th Dragoon Guards are the 'Green Horse,' and the 7th Dragoon Guards are the 'Black Horse.'

Among the infantry nicknames are quite common, and there are few corps unprovided with these. The Royal Scots, for example, are familiarly known as 'Pontius Pilate's Bodyguard.' This regiment is the oldest in the service, and claims descent from almost prehistoric times. There is a tradition, indeed, that it was on duty the night before the Crucifixion. Then the Middlesex are the 'Die Hards,' the Northumberland Fusiliers the 'Fighting Fifth,' the Norfolks the 'Holy Boys,' the Essex the 'Pompadours,' the Yorkshires the 'Green Howards,' and the East Lancashires the 'Lilywhites;' while the Rifles (by reason of their dark uniforms) are commonly termed the 'Sweeps.' Nearly all regiments, too, have mottoes. These are officially recognised, and on this account are duly inscribed in the *Army List*. They are not necessarily English in their origin, for many of them have been gained in return for good service performed abroad. Some, for example, are French or German, while others are Latin, and others again are Gaelic, Irish, or Welsh. The artillery and engineers are provided with a double allowance—'Ubique' and 'Quo Fas et Gloria ducunt;' and that of the Northumberland Fusiliers, 'Quo Fata Vocant,' expresses the same thought, but in fewer words. For the Worcesters the laconic assurance 'Firm' suffices; while the Seaforth Highlanders have 'Ciudich'n Rhi!' ('Long Live the King!') as their battle-cry, the Welsh Regiment that of 'Gwell Angeun na Chywilydd!' ('Death before Shame!'), and the Irish Fusiliers that of 'Faugh-à-Ballagh!' In the cavalry one finds such regimental watchwords as 'Quis Separabit?' (4th Dragoon Guards and 5th Lancers), 'Second to None' (Scots Greys), and 'Or Glory' (17th Lancers). The first thing that a newly joined recruit has to concern himself with is to learn the regimental motto; the second is to live up to it.

One would scarcely like to hazard a definite opinion on the delicate question of which is the bravest regiment in the British army. The ones with the most 'battle honours,' however, are the King's Royal Rifles, the Rifle Brigade, the Gordon Highlanders, the Royal Scots, the Seaforth Highlanders, the Gloucesters, and the East Kent. In respect of war decorations gained by officers still serving, the Gordons can muster three V.C. and eleven D.S.O., the King's Royal Rifles have one V.C. and twenty-two D.S.O., and the Devonshire Regiment one V.C. and ten D.S.O. Figures, however, really prove nothing, for no two regiments have the same chance of proving their valour on the field. One, for example, may be lucky enough to take part in half-a-dozen campaigns, while another is doing nothing more exciting than sentry-go at Aldershot.

The frequency of the changes introduced into military uniform is proverbial. No sooner does one pattern get sanctioned than a new one is substituted. Even in the 'good old days' this was the case, and fresh designs were continually being adopted. The date when the historic scarlet first came into use seems very doubtful. More than half-a-century ago the Duke of Wellington applied to Lord Mahon for information on the subject. The question was referred to Macaulay, who stated that the custom dated from the time of Cromwell. It was not, however, until the reign of Queen Anne that red was worn in the British army to any great extent. Prior to this colonels equipped their regiments very much as they pleased. Pig-tails, it may be mentioned, were only abolished in 1808, when trousers (termed 'overalls' in the cavalry) were also first adopted. A survival of the hair-powder period is seen to this day in the 'flash' worn by officers of the Royal Welsh Fusiliers. This is a triangular piece of black silk that hangs between the shoulder-blades. A still older distinction is the 'worm,' or black border, added to the gold lace of the Somerset Light Infantry. The privilege is supposed to be granted only to a regiment that takes part in a campaign in which a commander-in-chief is killed. The last corps to be honoured were those that fought at Quebec. To a civilian these distinctions may seem trifling; to a soldier, however, they mean a great deal.

A STORY OF THE BASQUE COUNTRY.

CHAPTER IV.

AS the brigadier reached Etcheverray's homestead, the object of this expedition, the astute owner was quietly getting out of his back-window. The brigadier had come along fast, but news of the enemy in a smuggling village, like rumour in an Indian bazaar, outstrips the telegraph, and the hurried departure of the three officials from the barracks had been duly noted by those appointed to keep watch and ward over their movements. But a sharp command to 'Halt!' backed by the sight of the dull barrel of a revolver pointed straight towards him, at once brought the fugitive up with a round turn; and when the brigadier sternly told him that all was known, but that if he came at once and pointed out the place where a possible descent and rescue might still be made he might keep his head on his shoulders, perhaps—though should the Anglais be already drowned it would assuredly fall into the basket—the smuggler at once saw the force of the argument, and professed himself ready not only to lead the way, but to make the descent himself. Meanwhile the news had spread through the village like wildfire, and it was at the head of its entire population that the gendarmes, carefully guarding their prisoner and accompanied by the hatless Nellie, started on their errand of mercy.

When at length they reached the spot where the smuggler assured them that they would, by leaving the road and getting to the edge of the cliff, be immediately over the position of the hole, the crowd, much to their disgust, were stopped—there were plenty of *douaniers* and gendarmes with them now—and Etcheverray, with the brigadier and a dozen men, and of course Nellie, made across the rough and heathery ground till they stood, with many furtive clutchings at hands and coat-sleeves, looking down a perfectly straight wall of rock at whose base there tore along a roaring, swirling torrent.

The smuggler's face paled at the sight. To dangle down into this awful chasm seemed more than he could attempt, but the brigadier's cheerful remark, 'Now then, look alive. I'll admit it does not look nice; but you may as well be drowned down there as guillotined. You may escape the first, but if you don't go the second 's a certainty,' appeared to stir him with that right spirit of desperation with which it is always best to tackle desperate ventures.

Throwing himself flat on his stomach, and peering over the edge, he seemed to be looking for certain marks on the face of the opposite cliff; which appeared to the eager spectators to be so close to them as to be almost within jumping distance from their side, though in reality it was many yards across.

After a close scrutiny he evidently found what he wanted, for, moving his position a little to his right, he threw off his coat, and, stepping into a loop prepared at the end of a long and strong rope brought by the *douaniers* and manned by a dozen of the strongest of them, he was carefully lowered over the edge, where he hung for a few moments swinging in the strong wind.

The brigadier now dropped down to him the end of a ball of stout twine, and gave him careful directions as to the way in which, by different numbers of jerks upon it, he could signal to those above whether to slack away or haul up according to the requirements of his position. Then, with an '*Allez doucement*,' the tension on the rope was relaxed, and the smuggler's set white face disappeared from view down into the wind-torn chasm.

A breathless silence now fell upon the crowd, for, impelled by an irresistible impulse, both the peasants and the *douaniers* set to keep them back had left the road, and swarming down to the cliff, had joined the party there without hindrance or rebuke. Slowly the rope was paid out, and harder grew the breathing of the men holding it; and then suddenly the brigadier was seen to start, and throwing up his hand, give the sharp order to halt. Then followed the command, 'Lower away again,' and then another 'Halt;' and now the rope could be seen by the eager watchers to be violently shaken, as if Etcheverray had fallen out of the loop or was engaged in a struggle of some description.

The excitement was now intense. 'What has happened?' was the question every second person in the crowd asked his neighbour, though none paid the slightest attention to the answer when one was given, which was seldom. The seconds sped, and still the brigadier stood motionless; no distinct signal came up the cord. Then a thrill suddenly stirred the people. The brigadier was seen to be handling his line like a deep-sea fisherman who has had a nibble, and then at last came the long-expected order, 'Haul away.'

What would be the catch? How slowly the rope came in! How heavy the man seemed to be! The *man*—why not the *men?* Oh, blessed hope! Nellie had sunk to her knees, unable to stand longer, and with clasped hands and staring eyes breathlessly watched each straining yard of manila as it rose with its unknown burden. Pull, men, pull! Your excitable friends behind you will tear the rope from your hands else. Ah, what is this? The brigadier and others stoop; some kneel; some lie flat. They have hold of something! Gently with it now! That's it; over it comes; and, with a great cheer rising from half a hundred rough throats, Etcheverray, clutching a long, dripping, red-bound sort of mummy, is dragged over the edge and de-

posited on the soaked ground. Then the smuggler, with a ghastly grin, says, 'He lives; my head is safe at any rate,' and closing his eyes, falls into a dead faint, stretched out beside his insensible victim.

. . . . . .

When Foster regained his senses he found himself in bed in his own room, with an uncertain, wavering figure, which he fancied was like his wife, sitting in a chair beside him. Closing his eyes again instantly, he lay silent. He felt strangely ill and languid, and every bone in his body ached as if he had undergone a sound thrashing. Then horrible fancies flitted across his brain. He was being strangled. He was being drowned. He was climbing awful precipices. He was struggling with a monster trout. He flung up into a sitting posture; he must land the brute somehow. But a gentle voice, the voice he loved best in the world, bade him be calm and rest, and a firm, cool hand placed his head on the pillow again, while a cup was put to his lips; and presently oblivion once more fell upon him, and under the influence of the draught he slept for many hours.

When he awoke he was another man. His brain was clear. All the terrible details of his adventure came back to him with perfect distinctness, and he eagerly begged Nellie to complete them with an account of his wonderful rescue.

This she did, graphically describing everything that had happened as far as she knew it; including Etcheverray's story of his experiences at the end of the rope, which he had hastened to proudly relate to a circle of gaping admirers directly he had recovered from his short faint. He had, it appeared, been just, and only just, in time. When he had been lowered to the level of the water, he could see no sign of the hole, nor of the stone with which it had been stopped. Scared by the rushing torrent, in which his legs were dangling, he was about to give the signal to haul up, when out of the yellow flood just above him there shot up a pair of brogue-clad feet tied together with a red worsted sash! Making a frantic grab at them as they bore down upon him, he managed to catch hold, and with incredible bravery and effort—according to his own account of course—succeeded in dragging Foster's inanimate body out of the clutches of the leaping river. Then, giving the signal to haul up by means of the cord which he had kept between his teeth, he had been drawn up, scraping and bumping against the rock, to the haven of the cliff-top, where, as has already been recorded, he indulged in a little faint. Both men had been rather roughly treated by the inequalities of their perpendicular path, but no bones had been broken or other damage done of a serious nature.

Etcheverray was now in the nearest prison, and would be removed shortly to the chief town of the department to take his trial, which Foster would have to attend when it came on. But I may as well state here that when, after the long months of delay so inseparable from French law, this event did take place, it ended in something remarkably like a fiasco for want of the chief witness. This gentleman had long since left the land of Liberty, Equality, and Fraternity (save the mark!) far behind him, and, free from his embarrassment, lived peacefully in 'Merrie England.' But this is anticipating.

The timely rising of Foster's legs above the water was attributed to the stone that kept him wedged up in the hole becoming loosened and being finally washed away by the current, thus causing him to slip out into and under the water. Luckily the air still contained in his wading-trousers—the sashes with which he was bound keeping it from altogether escaping—had caused his inflated legs to rise above the surface after his unceremonious launch. By a merciful dispensation of Providence, Etcheverray happened to be there at the same moment; a few seconds earlier or later would have sealed his fate.

The flood continued for several days, and effectually prevented any attempt at visiting the now renowned '*Trou des Anglais*,' while the existence of the bigger one with its fraudulent contents was apparently still a secret. Foster said nothing about that part of the business; he saw no reason why he should; and when pressed by the authorities for fuller details of his night's adventure, he evaded explanation by declaring that he could not remember anything that had happened previous to his imprisonment in the *trou*, but that doubtless it would all come back to him before the day of the trial. When, therefore, the river had at last fallen to its former low level the excitement had almost died away, and Foster took the first opportunity possible of wading up the gorge, unnoticed by anybody, in order to settle a little matter that had been worrying him ever since his adventure.

When he got back, safe but wet, Nellie, who had been watching for him, noticed at once that his face, which had been anything but cheerful lately, was positively radiant. So, divining that there was something in the air, she flew to meet him, crying, 'Oh Jack! what's up? Something good, I can see by your shining old mug'—Nellie, I regret to say, being somewhat given to slang on occasions.

Her husband kissed her. 'Yes, old girl,' he answered, 'it's something very good indeed. Come into the house and I'll tell you.'

Trembling with excitement, Nellie obeyed, and then only when they had got into their little sitting-room and had shut the door did Foster speak again.

Thrusting his hand into his pocket, he drew forth a lump of something that shone dully with a yellow lustre, and placing it on the table before them, said in quietly triumphant accents, 'There, my dear, that's a chunk of gold; and there is much more—how much I cannot yet say—where that came from.'

Nellie gave a little gasping cry. 'Gold, Jack—real gold? Tell me all about it at once, sir;' and Jack had to sit and tell his little story instanter.

'You remember,' he said, 'that I told you how I had noticed a wet and shining piece of rock in

a small crack in the roof of the hole just above my face, and how I hoped that a few drops of water would drip from it into my mouth when it rained. Well, as I lay waiting for death, that wet patch shone brighter and brighter as the light increased, but never a drop of water came from it. I have been wondering all these days since if it was really moisture that I saw, or could it have been coal or some other mineral or metal? And so, the way being, I hoped, practicable, I determined to settle the matter to-day. I have settled it; but the idea of gold never entered my head.

'Well, my dear, you see what it was; and, as I said, there is more, for I have found what is called a pocket, a hole in a rock where gold has accumulated —washed down by the river probably—in long ages past. It only wants getting out, and that I can do with a proper tool; and we shall soon see the extent of our fortune, which cannot be a big one. Pockets are not mines. But now I must impress on you, not a hint, not a whisper to a soul.' And Nellie willingly promised.

Foster returned to his hole the next day, as well as on many following days, on each occasion bringing back in his convenient fishing-basket many big lumps of the yellow metal. But he returned from his last visit with the news that the pocket was worked out. He had cleaned it of the minutest remaining speck. Nellie urged him to explore the gorge thoroughly and seek more of the fascinating metal. But Foster knew that although there was gold to be found all over the mountains, it was no secret. It was always in such tiny particles and so scarce that it was not worth the expense of working, a pocket such as he had found being the exception that proved the rule. He might spend his life—ay, a dozen lives—looking for another and never find one. 'No,' he told his wife, 'we have no time to waste in wild-goose chases.'

So, settling up their affairs in the little village—which was not a difficult operation—and paying off the maid, and making the heart of the youthful Bertrand nearly burst with joy by presenting him with what is the ambition of every French boy to possess—a bicycle—they took their departure ostensibly for the plains, and were back again in England before the French authorities had any idea that the only witness against Etcheverray had left them lamenting.

The gold, sold in Paris to avoid the formalities of the Customs, realised nearly four thousand pounds, by which the legal gentlemen got their cheque, and the furniture was saved. Now that the remembrance of what they went through during that fateful flood is somewhat dulled, Foster and his wife often think with regret of the pleasant, homely time they spent in their vine-clad Pyrenean home.

THE END.

GOLCONDA: A CITY OF THE DEAD.

By An Anglo-Indian.

THERE is always something pathetic and yet something calming in a dead city. Even the frivolous cannot escape for a moment contrasting what was with what is. One realises the littleness of individual life as one stands upon the burial-place of dynasties, the grave of an empire. It is a spot apt to give rise to moralisings. True, the mighty have passed away and you remain. Yet what a little space it will be in the history of those ruins before you too fade away into that Nirvana in which men of all creeds have some hope!

Such a spot is Golconda, once of fabulous wealth and a fortress of impregnable strength, renowned throughout India in the days when England was inhabited by savages who belaboured one another with clubs. Yesterday the capital of an empire; to-day a mass of crumbling granite. As you climb its rugged, rubbish-strewn streets it is impossible to scoff at Macaulay's picture of some future New Zealander sitting upon a broken arch of London Bridge to sketch the ruins of St Paul's. Golconda was once as mighty as London; to-day it is but a name which is almost forgotten. The voice of the tourist echoes along its galleries; the photographer steadies his camera upon a royal throne. Empires have risen and passed away. Why should ours last through all time?

To-day the capital of the Nizam of Hyderabad, the greatest native ruler in India, looks an old city. Its high walls shut in a civilisation which belongs to a former age. But Golconda, sweltering in the plain six miles away, was ancient before one stone of Hyderabad stood upon another. Hyderabad sprang into existence only because Golconda was overcrowded. The gloomy fortress dates back two thousand years. It was a comparative modern—in the successor of Ibrahim Shah, who greatly strengthened the citadel—who began to build Hyderabad in order to relieve the pressure within the rock-built city. To-day Hyderabad has a population equal to that of Sydney. Golconda is a ruin.

It was early in the morning when I drove out from Saifabad, one of the leafy suburbs outside the walls of Hyderabad. In April in the Deccan you make your excursions before the sun is high in the heavens. The track lay across a barren land, already quivering in the glare. Brown earth, sand, a few wretched huts, small boulders and huge rocks, and away in the distance a great dark mass which ultimately resolves itself into a town built steeply up a granite mountain rising abruptly from the plain. Golconda stands alone. Not a dwelling

breaks the monotony of the desert which laps its walls. On a slight rise half a mile away stand the great tombs of those who ruled before the Nizams; but their massive domes are dwarfed by the frowning fortress which dominates the plain.

Three miles round are the granite walls, with their eighty-seven bastions; above them towers the four hundred feet of rock upon which the citadel is built. Once inside the gateway of the silent city, you have stepped out of the India of to-day. In a moment you have gone back centuries. There are said to be modern troops quartered in Golconda. Perhaps so. But the living seem to have no association with the city of the dead; they do not even inflict themselves upon the sight. All is silence; only the fierce sun floods the street with a gold-red blaze. You feel lost and awed amidst the still formidable battlements and the decaying palaces. Surely spectral warriors must lurk in those dark-shadowed entries, ready to resume the conflict suddenly ended by treachery. Even now the gigantic gates, studded with iron spikes, are strong enough to resist the charge of the war-elephants; even now huge cannon lie just as they fell during the eight months' siege in 1687, when Golconda the Impregnable defied Aurungzebe, and yielded only to treachery; since when she was ashamed, and her glory departed, and her people stole away to Hyderabad. Even to-day hundreds of old cannon-balls cut out of solid granite lie just as they were left by the defenders as they fled before the inrush of men let in by the traitorous noble; some of the quaint old ammunition resting upon the walls as it was placed to repel the attack which never came. Here and there the old guns have been used as drain-pipes for houses. Alas for Golconda, once the mighty!

But let us go through the Bala Hissar Gate—the only entrance—up into the citadel. The way is steep. A winding, broken, many-stepped path is all that leads to the summit. This was once a mountain of treasure, filled with the spoils of many a war. Nadir Shah is said to have carried away fifty million pounds sterling of spoil from the sack of Delhi; and the sack of Golconda must have yielded enormous profits to the victors. If these crumbling walls could speak, of what intrigues, battles, pleasures, spectacles, horrors, deaths, could they not tell! What mighty armies defiled upon the plain beneath! Here is the famous Ambar Khana, the king's storehouse, which once contained gold and jewels of incalculable value, including, it is said, the Koh-i-nûr diamond. That tumble-down palace may be the one in which the ambassador sent by Shah Abbas of Persia to the world-famed city lived during his compulsory stay of six years, unable to return owing to the advance of the Moguls into the Deccan. Now come mysterious black passages leading into the bowels of the rock—one, it is said, extending for miles beneath the plain, but which no one seems inclined to explore. Up, still up. Broken walls, disused palaces, dry wells, empty treasure-houses, ruined temples. Above all, the ruins of a king's palace, and above that a queen's throne—carefully whitewashed for a Viceregal visit.

Far below, buck browse quietly in the shade of the ruined battlements; in the distance the white walls of Hyderabad gleam in the sun. But Golconda the Magnificent is silent, desolate, deserted; her nobles and warriors have passed away, and lizards run fearlessly over the rusting cannon. 'Palace and mosque,' wrote the late G. W. Steevens, 'armoury and treasure-house. They are all gone. Only remains a shapeless waste of stones, almost as rough and not so substantial as the huddled granite that was before them and remains after. Two miles away rises a heap of boulders about as high; two miles from either you could not tell which was fabulous Golconda and which was creation's lumber.'

THE MONTH: SCIENCE AND ARTS.

TREASURE-TROVE AT KARNAK.

KARNAK, near Luxor, on the Nile, is well known to Egyptian tourists, and the photographs of its wondrous pillars have made it familiar to those who are not travellers. It was at Karnak that a remarkable discovery was recently made. Just below the world-famous temple no fewer than eight thousand statues, of all sorts and sizes, mostly in a wonderful state of preservation, have been unearthed from what was evidently a hiding-place. This is perhaps the most notable 'find' in the land of the Pharaohs since the discovery of the royal mummies. For some years past operations have been in progress, under the direction of M. G. Legrain, having for their object the restoration of the great Temple of Ammon at Karnak, and it was during the course of these works that a pit was discovered in which the statues were found. These mostly date from the Ptolemaic period, and are generally of gilded bronze; but some five hundred are chiselled from granite, basalt, limestone, petrified wood, and other materials. Nearly all the statues bear historical inscriptions, and (so far as one can judge from the discoverer's excellent photographs, which are reproduced in the *Illustrated London News*) they are little the worse for their long burial, or rather submersion, for the soil in which they were found was not dry sand, but mud due to infiltration from the adjacent river.

CURE OF FOGS.

It is easy enough to show on the lecture-table that an artificial fog in a glass globe can be at once dispersed by electricity; and by use of larger

apparatus it would, of course, be possible to clear the air of a large hall. But we can never look to such means to kill the fog-fiend which every year proves such a costly visitor to our towns and cities. Sir Oliver Lodge, in speaking on this subject recently at Birmingham, urged prevention rather than cure. We must improve our methods of combustion, and not allow crude coal to be burned incessantly as we now do. He recommended the system which has more than once been advocated in these columns—namely, that gas should be supplied for daily consumption—not for lighting, but as a cheap non-illuminating gas for heating and cooking purposes. Possibly he for the moment forgot that such a non-illuminating gas, which might be supplied for a few pence per thousand feet, would serve as an illuminant in conjunction with a Welsbach mantle. 'When that was done,' said he—'and there were none but governmental or manufactural reasons for not doing it that he knew of—town air would become much cleaner and purer, and towns already well drained and otherwise kept healthy would become the healthiest and pleasantest places to live in.' We must not, of course, lose sight of the fact that, however thoroughly we purify the air, we can never banish the white fogs which are natural to our climate.

JUPITER'S SIXTH SATELLITE.

Jupiter's four moons are familiar to most persons, for they can be detected with a very low magnifying power. Some persons, indeed, have claimed to see them with the naked eye. They were first discovered by Galileo just three centuries ago, by aid of the very imperfect optical means at his disposal, and were named respectively Io, Europa, Ganymede, and Callisto, but they are now generally known by the numbers 1 to 4. In September 1892 the great refracting telescope of the Lick Observatory at Mount Hamilton, in California, with its yard-diameter object-glass, enabled Professor Barnard to discover a fifth satellite belonging to the giant planet; and now the first notable astronomical discovery of the year 1905 is found in the detection of a sixth satellite. The discovery was made by Professor Perrine at the Lick Observatory, with a reflecting telescope of three feet aperture, which originally came from England. The new satellite is said to be of the fourteenth magnitude, and is some five or six million miles distant from its primary.

AFRICAN EXPLORATION.

The great stretch of country, about as large as France, which lies west of the Transvaal, and which is known as the Kalahari Desert, is now to be thoroughly explored. As long ago as 1894 the late Mr Cecil Rhodes despatched an exploring party on the same errand; but owing to various adverse circumstances the enterprise ended in failure. The commission which has been appointed for the new enterprise will be accompanied by an efficient staff of experts, and there is every hope that success will attend their efforts. The country contains no cultivated land, and is sparsely inhabited by a few nomadic tribes of Bushmen, with a few families of Hottentots. It is crowded with game, such as the eland, hartebeest, gemsbok, giraffe, &c., which thrive on the rich pasturage. There is little water, but evidence exists that plentiful supplies can be tapped beneath the surface. Signs of diamondiferous deposits are not wanting, and the commission will no doubt discover that there are other mineral treasures which only invite development.

OUT OF DATE.

It is the natural fate of human contrivances to become very soon obsolete, and especially is this the case with the appliances which every civilised nation employs for the destruction of its enemies. Ships and guns costing millions of money, which at the time of their construction were the best procurable, are cast aside very often before they have seen any active service at all. We learn one day that the British army has the finest rifle of any body of troops in the world; a short time elapses, and the order goes forth that it is to be replaced by something better. Our army is just now in this transition state with regard to its artillery. New guns are to replace the old; and if all reports be true, the fresh weapons, charged with an improved form of cordite, will be of remarkable efficiency. For example, an eighteen-pounder gun, with a charge of only one and a half pounds of cordite, will be able to pepper an enemy with shrapnel at a distance of four miles at the rate of fifteen rounds per minute. At a distance of two and a half miles effective aim will be possible, while at a mile and a half most accurate shooting will be secured. Each gun will carry about one hundred rounds.

'THE COW WITH THE IRON TAIL.'

Milk can be so easily adulterated, by adding to the amount of water which it naturally contains, that it long ago became necessary in the interests of consumers, to whom a pure milk-supply is a matter of such vital importance, to define by law the proportion that the solid constituents should bear to the liquid. Eventually the Board of Agriculture fixed upon a limit of 3 per cent. for fat and 8·5 per cent. for non-fatty solids. Since that was done many farmers and dealers who have found their way into the law-courts on the charge of selling milk not up to the required standard have pleaded that vagaries of climate have caused their cows to yield an impoverished supply, and that they (the purveyors) should not be held responsible for that which was obviously out of their power to control In order to settle the question once for all, the Essex County Council arranged a series of exhaustive experiments covering a period of three years, conducted under the supervision of a small committee of experts. The results are briefly summed up in the following quotation from their report: 'Whatever may be

the case with individual cows, the analyses afford no evidence that either excessively dry or excessively wet weather produces any such influence upon the mixed milk which finds its way into public consumption as to render the Board of Agriculture limits unfair or onerous to the farmer.'

AUTO-PASTEL.

Auto-pastel is the name of a new photographic paper which has been introduced by the Autotype Company, whose name is so much identified with the development of carbon-printing. The charge of want of permanency, which was at one time with such good reason brought against photography, is no longer true, for the modern photographer has many prepared papers to choose from, prints upon which can be guaranteed not to fade. The new paper is one of these, for it is coated with a permanent pigment, which is made sensitive to light by immersion in a 5 per cent. solution of bichromate of potash. After drying, the paper is exposed to light beneath a negative in an ordinary printing-frame, and is then developed, the developing fluid being simply water. A bath of cold water is followed by floating the exposed paper on water at a temperature of from one hundred and twenty to one hundred and fifty degrees Fahrenheit for two or three minutes. Then the paper is turned upwards and gently brushed in all directions with a large camel's-hair brush, certain parts being rendered lighter according to the taste of the operator. A final wash in cold water completes this very simple method of making a photographic print.

STARLINGS.

A correspondent of *The Field*, writing from Perthshire, complains that certain parts of the county are infested with enormous flocks of starlings, and that he believes that they will soon drive away all the song-birds from the neighbourhood. He asks whether residents in other parts of Britain have been plagued in the same way, and seeks advice as to a remedy for getting rid of the intruders. He is answered by a gentleman at Cheltenham, who protests against the proposal to destroy the starlings, and who says that they do not injure song-birds. In a wood near his house hosts of starlings roost every night, and there are plenty of song-birds too, the starlings being quite indifferent to their presence. He writes that it is a sight of surpassing interest and grandeur to see these clouds of starlings sail up and go forth in ordered movements; and he calls upon all naturalists, upon all who can see beauty and poetry where these exist, upon all who love birds, to protest against the destruction of starlings.

THE PIANOFORTE.

The evolution of the most popular of our musical instruments, the pianoforte, formed the subject of a lecture recently given by Mr George Rose in aid of the funds of the Music Trades' Benevolent Society. It will no doubt come as a surprise to many to hear that Nebuchadnezzar's dulcimer and psaltery were the precursors of the modern domestic instrument, and that the psaltery, which survives as the zither, is the ancestor of the spinet. About five hundred years ago a key-board was added to the psaltery, and it became the clavichord, an instrument which was long in vogue, and which ladies would play standing in front of it. This was the favourite instrument of Bach, so that we may be sure that it possessed several good points. He did not care for the spinet, which he found wanting in soul; and as for the then newly invented pianoforte, it was far too clumsy and harsh to win his taste. The harpsichord was the direct predecessor of the pianoforte, and was far more ambitious in its design than any of its predecessors, for it had three strings to each note, and was generally furnished with two rows of keys. The Venetian swell common to organs was invented by Schudi, the founder of the firm of Broadwood & Sons, who was making harpsichords in London in 1728. This method of controlling the volume of sound was applied by him both to harpsichords and pianofortes. It is interesting to note that the earliest recorded public performance on the pianoforte took place at Covent Garden Theatre, London, on May 16, 1767, when the playbill announced that at the end of Act I. of the *Beggars' Opera*, Miss Brickler would 'sing a favourite song from *Judith*, accompanied by Mr Dibdin on a new instrument called the pianoforte.'

THE TEACHING OF MUSIC.

In a recent address at Manchester, Sir Frederick Bridge chose for his subject 'A Weak Spot in Musical Education,' the said point of weakness being the inability of the majority of amateurs to read music at sight. And the charge is true with regard both to singers and pianists, although the former have only one line to read, while the latter have a more complex task. A striking instance of this ignorance on the part of amateurs was furnished by the lecturer himself, who asserted that recently, in trying the voices of thirty-two contraltos who were candidates for admission to the Albert Hall Choir, only three passed the simple sight-reading test. The fault is undoubtedly in the method of teaching. In the case of the pianoforte-player, everything is sacrificed to the endeavour to conquer difficult passages so that brilliant execution of one or two pieces can be assured. Hence it is that the majority of amateurs who are accounted fine players can hardly play a simple hymn tune correctly when asked to do so at first sight. The faculty of reading music at sight can be comparatively easily acquired by singers and by players of orchestral instruments if only a little time be devoted daily to theory and exercises.

JAPANESE ART.

At the recent conference of teachers one of the subjects dealt with was 'Art Teaching in Japan,' upon which occasion Baron Suyematsu (lately Minister of the Interior in Japan) took the chair.

He said that the principal object of art-teaching in his country was to make the study useful to the student in after-life. Mr E. F. Strange, of the South Kensington Art Schools, spoke in terms of great admiration of Japanese art, and pointed out that the studies of plant-forms, birds, fishes, and insects made by the artists of that country were unsurpassed. He also noted that Japanese artists had depicted birds in motion in such attitudes as only the quite recent developments of instantaneous photography had proved to be true to nature. Japan had still a distinctive and national art of its own, and he feared that it was in grave danger of being adulterated beyond recognition by admixture of modern Western ideas. He earnestly desired that Japan would abandon the wish to learn anything from us in the way of art. Another speaker, while acknowledging that the Japanese were gifted with high æsthetic culture, dwelt upon the curious circumstance that their artists utterly failed in their delineation of the human figure. They neither drew it beautifully nor had they the slightest conception of its beauties.

EXTINGUISHING FIRE ON SHIPBOARD.

Fire is under all circumstances a most dreaded agent of destruction; but it assumes a peculiarly terrible aspect when it breaks out in the hold of a vessel which is hundreds of miles from land. Many suggestions have therefore been made with a view to quickly quench such a conflagration or to make its occurrence impossible. One of the latest is described by the *Railway Supplies Journal* as the invention of Dr Staff of St Ives, Cornwall, who proposes to fix in the holds of a ship tanks containing pieces of broken marble or chalk. These tanks would be connected with the main-deck by means of pipes, and when a suitable acid solution was conveyed to the tanks through these pipes sufficient carbon dioxide gas would be generated to cover the cargo and prevent or stop combustion. Another important result would be attained in the extermination of any rats which might infest the ship. The inventor is apparently not aware that carbon dioxide is now obtainable commercially in liquid form, and that the same results would be brought about by releasing the compound from its steel containing-cylinder into the hold of the ship. The necessity for special apparatus would thus be entirely avoided, as would be the handling of corrosive acid.

A NEW LIFEBOAT.

The ordinary lifeboat, familiar to all who have visited our seaside-resorts, is built for safety and not for speed; and when at the local regatta opportunity is afforded of seeing it fully manned and under sail, it is admitted that its progress under the most favourable circumstances is but slow. Steam lifeboats have been introduced, and in many cases the strong steam-tugs kept at busy ports always ready for an emergency do life-saving work. An interesting experiment is about to be made in the employment of the motor-driven boat, the engine of which can at a moment's notice be put into action. The boat in question is at once to be stationed at Newhaven, and we shall no doubt soon hear that it is doing good work. Such a boat could not be designed without much forethought; and, among other necessities of construction, the engine had to be entirely enclosed so as to protect it from breaking waves. It was also necessary to adjust the position of the machinery so accurately that the boat should right itself without difficulty. The motor lifeboat will not only ensure good speed in reaching a wreck, but will enable the crew to conserve their strength until the moment of rescue arrives.

NEW PRUNES.

From Japan, dried Kelsey plums have recently been imported to London, Paris, and Bordeaux. This plum yields a superior prune to that of Bordeaux, and is considered one of the largest and finest in commerce. The Kelsey plum, brought from Japan, has flourished in Cape Colony, California, and Italy. The consumption of prunes in the United States exceeds one hundred million pounds annually, and San José is the prune metropolis of California, nearly all its inhabitants being dependent on the industry, which dates from 1886. In Santa Clara county ten thousand trays of fruit may be seen drying at one time. When sufficiently cured, the prunes are stored in separate bins, and there allowed to 'sweat' for ten or twenty days, after which they are ready for market.

THE RIVER.

Flow on, thou shining river, whose clear tide
From sources secret and unseen is fed,
Whose laughing waters to the vale are led,
Kissing the gray sands over which they glide.
I watch thee pour thy waves upon the dried
And sun-parched ground, enriching it with free
And generous dole, while speeding to the sea,
Whose bounty first thy copious urn supplied;
I watch thee, and I blush with conscious shame:
Thou speed'st rejoicing, I too oft repine.
Heaven is my home, as th' ocean-bed is thine,
But thou remember'st, I forgetful am.
Blithely thou hastenest to thy destined place,
I with slow steps pursue my heavenly race!

William Cowan.

*** TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Printed and Published by W. & R. Chambers, Limited, 47 Paternoster Row, London; and Edinburgh.

DORNAY'S REVENGE.

By T. W. SPEIGHT.

IN THREE CHAPTERS.—CHAPTER I.

IT was well for Dornay, when, on a certain August morning, he landed at Southampton from the P. and O. steamer in which he had voyaged from Bombay, that the police, of whom there were several about the landing-stage, had no inkling of the nature of the errand which had brought him back to his native country, or they would assuredly have shadowed him both by day and night, and so have frustrated the deadly purpose to the accomplishment of which he had vowed himself.

He was a tall, very spare man, with a long, lean face, clear-cut aquiline features, a thin-lipped mouth expressive of much determination of character, and darkly brooding, deep-set eyes under heavy brows. He was clean-shaven save for a thin white moustache with upturned ends, while his hair, also snow-white, was closely cropped. His complexion was burnt almost to a mahogany tint by the scorching sun of more than thirty Indian summers. He was dressed in a suit of white drill, with a pith helmet and a pugaree; but he would have felt more at his ease in the cool, flowing robes and the turban of a Hindu gentleman. When he landed, his sole luggage proved to be a dressing-bag and a medium-sized portmanteau; but in one hand he carried a small metal box, the lid of which was perforated with a number of minute holes, in appearance not unlike a box for fishing-bait. He took the first train to London, and on arriving there, was driven to a certain hotel in the heart of the City.

'I'm not a West-End man,' he told himself. 'I shouldn't feel at home among a lot of swells.'

At the hotel he bargained for a sunny bedroom. He was shown several, and chose a corner room with two windows, one of them fronting due south and the other due north. It was the hottest month of the hottest summer that had been experienced for years; but Dornay found the weather just to his liking. 'After all, there's no climate which comes up to that of Old England,' he reflected.

When a cup of tea had been taken up to him, he locked the door, shut the windows, drew up the venetians, and flooded the room with the hot, brilliant sunshine. The City clocks were striking five.

Then from his dressing-bag he took a stoppered phial containing some sort of unguent, with which he proceeded to smear his face, his ears, such portion of his neck as was exposed, and his hands. That done, with a tiny key attached to his watch-guard he unlocked the metal box of which mention has been made, and opened the lid. At once there issued from it a couple of flies, the like of which, it is not too much to say, had never been seen in England before. They were about the size of a common house-fly, but differed widely from it in appearance. Their bodies were longer and more tenuous, and in colour a sort of silvery-gray, while their wings were even more diaphanous than those of a mosquito, so that in some lights they were all but invisible; but when the sun shone on them they became beautifully iridescent.

At first they fluttered round Dornay; but, finding no point of attack left bare by the unguent, they presently quitted the shade in which he was sitting for the flood of sunshine which was being poured in through both windows. For a full half-hour Dornay sat without stirring, gravely watching them, as, like two specks of quivering silver light, they flew to and fro more swiftly than the eye could follow them, sometimes circling in graceful spirals, as if ascending and descending an invisible staircase, sometimes climbing the hot window-panes as if in search of an exit into the open air.

Then Dornay stripped off his coat, and, having bared his left arm to the elbow, he laid it along the table and waited. Not more than twenty seconds had gone by before his flies had settled upon it and were busily at work. Dornay sat perfectly still,

[*All Rights Reserved.*]

watching them through a magnifying-glass till they were ready to drop off from repletion. Then, taking them up tenderly, he replaced them in the box, the bottom of which he had previously sprinkled with an aromatic powder. That done, he relocked the box and placed it in the heart of whatever sunshine still remained.

In the course of next forenoon he booked himself at the King's Cross terminus for the nearest station to Marslade, his native village. Now that he was back in England for a short time, a longing had come over him to visit once more the place where he was born and brought up.

Three hours brought him to his journey's end. After an early dinner, he proceeded to feed his flies with precisely the same precautions as on the day before. The afternoon and evening were spent by him in rambling about the old village and refreshing his memory by revisiting the scenes and haunts of his youth and early manhood. In the dusk of evening he stood for a little while bareheaded by the grave in which his father and mother lay buried.

But it was not merely to revisit the grave of his parents and to renew his acquaintance with the home of his youth that he had travelled all the way from Sarunjah. Far otherwise. The dark purpose which had driven him across six thousand miles of ocean still gripped him as tenaciously as ever it had done, and he trusted that the morrow would bring him at least one step nearer its accomplishment.

Will Dornay's progenitors from the time of his great-grandfather, and, for aught known to the contrary, from a period anterior to that, had been blacksmiths at Marslade. There was a tradition which had come down from father to son, since no one knew when, that the Dornays were descended from a younger branch of the D'Aurignys (a family which traced its pedigree back to the time of the Conqueror), but that in the course of several generations the name had gradually become corrupted to what it was now. As if to lend a touch of verisimilitude to the tradition—which was less a tradition than an article of faith—the family cherished as a sacred heirloom a silver drinking-cup on which was traced in rude characters the name 'Will D'Aurigny,' with the date '1636.' Here, surely, was a proof to which no reasonably minded person could demur that the Dornays were indeed directly descended from the now extinct D'Aurignys of Castelmere!

It was a matter of course that young Will should be brought up to the family calling, and in due season step into his father's shoes. But Will was ambitious, and longed for a wider horizon than shut him in at Marslade. For all that, he worked at the forge till he was twenty; then he fell in love with and married a pretty, feather-brained girl, a milliner's apprentice in the nearest large town, who had come to the village on a visit to some relatives.

Three years later his wife eloped. She had gone to stay for a time with her parents, and it was from their house that she disappeared. Dornay made no attempt to discover what had become of her. 'A woman who will do what she has done is not worth troubling about,' he told himself. Among the things she had left behind her he found a note addressed to her in impassioned terms, and signed 'G. Udale,' of which he took possession, together with a photograph, doubtless that of the scoundrel who had lured her from her home.

Dornay had been fond of his wife without being in the least blind to the frivolity of her character, and the loss of her made a gap in his life which just then he found it impossible to fill. He had long been possessed with a secret desire to join the army, and had he not married in haste he would probably have done so. Now, however, there was nothing to hinder him from carrying out his unspoken wish. Was not a soldier's life a proper life for one who had D'Aurigny blood in his veins? So, leaving his eighteen-months-old child—a girl—in his mother's charge, he took train for London, and there enlisted in a regiment which, six months later, sailed for India.

When Dornay had been nearly two years in the East, certain tidings reached him which cut him to the quick far more than his wife's elopement had done. His daughter had been kidnapped—stolen away in the dusk of evening, presumably by a troop of gipsies who were encamped in the neighbourhood; but all the efforts of the constabulary had failed either to trace what had become of the child or to bring home the guilt of her abduction to any one.

And so five years slipped away. Dornay, who had developed rather uncommon linguistic gifts, had risen to the position of drill-sergeant to one of the native regiments just then stationed at Changudda, in the Madras Presidency. About this time the health of one of the officers, Captain Kerrison by name, broke down, and he was invalided home. It was with a shock which for a few moments absolutely stunned him that Dornay heard the name of Captain Udale mentioned as that of the officer (transferred from another regiment) appointed to fill the vacancy thus created. Could the coming officer be the man with whom his wife had eloped? The name, not a very common one, was the same. Dornay had carefully preserved the photograph, together with the note, found by him in his wife's box. He awaited with smothered impatience the coming of Captain Udale.

In due course the latter arrived. One long look at him when he first appeared on parade was enough for Dornay. There, within twenty yards of him, stood the original of the photograph!

From that hour he became, as it were, two men in one body. One of them was the smart soldier, cold and impassive, who went through the routine of his duties with mechanical exactitude and *aplomb*; the other, equally cold and impassive to outward seeming, hid within his breast a smouldering vol-

cano which at any moment might break into eruption, and only awaited some chance occasion to cause it to do so. From information derived through a secondary source, Dornay had ascertained that Captain Udale was the son of Sir Myles Udale, a baronet of old family, whose ancestral home was in the Peak of Derbyshire.

And now hour after hour, when his day's duties were over, and often far into the night, the blacksmith's son of Marslade sat brooding over his wrongs, and for the thousandth time asking himself the same question: how best he could avenge himself on the villain who had robbed him of both wife and child. For, as he rightly enough argued, had not his pretty, feather-brained Annie allowed herself to be led away by Udale, mother and daughter would never have been separated, and neither one nor the other would have been lost to him, as both now were, and for ever. The blood of the D'Aurignys cried aloud for vengeance.

But the more Dornay pondered the matter the more clearly he realised his helplessness. Nowhere did he see his way to carry out the design which lay so close to his heart. It sometimes happens, however, that when things seem at a deadlock Chance steps in and brings about an *éclaircissement* of the most unexpected kind. And so it fell out in the present instance.

Among other of Kerrison's belongings which Udale had taken over was a pet monkey, which was a favourite with everybody in the cantonment. Jacko had been allowed a great deal of freedom, a privilege he had never abused; but from the first Udale had kept him almost continuously chained up, a proceeding which drove the poor brute to the verge of madness. One day, however, he contrived to slip his chain, and for the next few hours he had a real good time after his own fashion.

Late the same afternoon, as Dornay was crossing the barrack square, he saw Captain Udale emerge from the officers' quarters armed with a dog-whip. Going up to Jacko, who had been caught and was chained to a staple in the wall, he began to lash him unmercifully. 'I 'll teach you to thieve, curse you! I'll teach you! I 'll teach you!' cried Udale, his features distorted with rage. Jacko's screams rent the air.

The train had long been laid, and now the match was applied.

Dornay strode swiftly up to Udale, his face like a white mask, and stepping between him and Jacko, turned and faced him. 'You brute! You cowardly brute!' he exclaimed in the low accents of concentrated hate. 'It is you who ought to be flogged, and not this poor beast. Touch it again at your peril.'

Sheer amazement paralysed Udale's tongue for a few seconds while the two stood and glared at each other. That any non-com. should have the audacity to address his superior officer in such terms was incredible. But he should pay dearly for it.

Advancing a step, Udale lifted his whip with a threatening gesture. 'Out of my way, you hound,' he exclaimed, 'or I will serve you as'——

The sentence was never finished. Dornay's right arm shot out from the shoulder, and the next moment Udale was sprawling on his back in the dust. Ten minutes later his assailant was thrust, handcuffed, into the semi-darkness of the guard-house.

By the court-martial which sat three days later Dornay was sentenced to receive two dozen strokes with the 'cat,' to be followed by a year's solitary confinement. He had been a favourite with his colonel, and but for that fact his sentence would probably have been a more severe one.

Next morning Dornay underwent his flogging in the barrack square before the assembled regiment. He bore his punishment in grim silence. When it was over he was escorted to the infirmary and left in the doctor's hands. He had still to undergo the second part of his sentence, but in the course of what was to have been the last night of his stay in the infirmary he disappeared. How he contrived to elude the vigilance of the sentries was a mystery which was never cleared up. Small detachments of troops were sent out in different directions, and a perfunctory search made for him; but nobody seemed particularly anxious to recapture him. It was rightly conjectured that he had taken to the jungle; and as he spoke the vernacular almost like one to the manner born, he would have no difficulty in making his way up-country should he be desirous of doing so.

And, in point of fact, that was what Dornay had set his mind upon doing. A rumour had been current in Changudda that the Rajah of Chuttenpoor, who had lately returned from a European tour, was about to remodel his army in accordance with Western ideas, and it had seemed to Dornay that, should such prove to be the case, the Rajah might not be disinclined to take him into his service.

Accordingly, one morning just six weeks after his unauthorised departure from Changudda, Dornay crossed the bridge, and, passing through the great arched gateway, entered the city of Sarunjah; and, having bathed and eaten, lost no time in seeking an audience of his Highness, who made a point at a certain hour of the day of being accessible to any one.

(To be continued.)

THE REWARDS OF PUBLIC SERVICE.

By W. V. Roberts.

JUDGED by the glittering standard of money, the rewards awaiting men who devote themselves to the public service, as represented by the House of Commons, are relatively small and not calculated to tempt those whose object in life is to amass wealth. It is true that the post of Cabinet Minister, with an emolument of five thousand pounds a year, can never be without attractions; but it can hardly be said that those attractions preponderate on the financial side. What, for instance, are the chances of a man entering the House of Commons for the first time, full of high hopes and aspirations, becoming a Cabinet Minister at all, and how long may he have to wait before obtaining even the smallest office? There are six hundred and seventy members of the House of Commons all told, and only about thirty, certainly not as many as forty, can in the ordinary course hold office at one time. It is clear, therefore, that there may be much waiting for opportunity.

Obviously, a man's greatest chance comes when a new Ministry is being formed and all the offices are being filled at the beginning of a new Parliament. But one may enter the House of Commons at almost any time, for by-elections are constantly taking place, and vacancies in the Government, affording opportunities for those who already have seats in Parliament, are of common occurrence. Mr John Morley was first returned to Parliament at a by-election in 1883, and within three years he was a member of the Cabinet as Chief Secretary for Ireland. On the other hand, the late Mr R. W. Hanbury sat in the House of Commons for twenty years, and was fifty-five years old before he attained Cabinet rank as Minister of Agriculture. Again, Sir Michael Hicks Beach entered Parliament when twenty-seven years of age, and four years later he became Secretary to the Poor-Law Board. From that time, until he retired from the Chancellorship of the Exchequer in 1902, he was never out of office when his party held the reins of power. But as against an experience like that there is the fact that several members who have sat continuously in the House of Commons since 1868, a period of thirty-six years, have never held office of any sort. Aptitude, desire, and opportunity count for much, and none can say when a young man enters the House whether he will ever attain to office and to leadership or remain throughout his life an unknown private member.

But what is the financial gain when office has been secured? There are sixty posts in the Government of the day filled by Lords and Commons, who change with a change of Ministry. Of these sixty, thirty-three are now held by members of the Lower House. Sometimes the proportion is less favourable to members of the House of Commons, an allotment of thirty offices to them being a fair average. The best-paid post is that of the Attorney-General, who last year received in salary seven thousand pounds and in fees twelve thousand nine hundred and twenty-one pounds seven shillings and ninepence, making in all the very respectable total of nineteen thousand nine hundred and twenty-one pounds seven shillings and ninepence. The Solicitor-General, who last year took second place, received in salary six thousand pounds and in fees seven thousand and sixty-eight pounds nineteen shillings and threepence, a total of thirteen thousand and sixty-eight pounds nineteen shillings and threepence, which can hardly be considered bad as incomes go nowadays. Such posts are not to be despised by men who attach importance to mere money; although, if memory rightly serves, they were not in Mrs Micawber's mind when she reflected upon the possibilities of the law for her distinguished husband. The other law officers of the Crown are less fortunate than their English brethren, for the Irish Attorney-General and the Irish Solicitor-General last year received, the former less than seven thousand pounds, and the latter not quite four thousand pounds. The salary of the Lord Advocate for Scotland is fixed at five thousand pounds, and that of the Solicitor-General at two thousand pounds. Here, then, are six posts out of thirty-three that have gone straight to the lawyers, substantially reducing the number available for the ordinary member. Putting aside the six law officers of the Crown, we find that the members of the Government receive annually in the aggregate a sum of one hundred and thirty-seven thousand pounds, those in the Cabinet taking seventy-eight thousand four hundred and twenty-five pounds, and those outside the Cabinet fifty-nine thousand four hundred pounds.

Here, again, the best-paid offices in the Cabinet are those of the Lord Chancellors of England and Ireland, who take respectively ten thousand pounds and eight thousand pounds a year. The First Lord of the Treasury (who is usually Prime Minister), the Chancellor of the Exchequer, and the five Secretaries of State—Home, Foreign, Colonial, Indian, and War—each receive five thousand pounds. The salary of the Chief Secretary for Ireland is fixed at the odd sum of four thousand four hundred and twenty-five pounds, and all the other members of the Cabinet are allotted two thousand pounds a year each. Outside the Cabinet, the most highly paid member of the Government is the Lord-Lieutenant of Ireland, whose salary is fixed at twenty thousand pounds a year. From the point of view of money it might be supposed that this office is more to be desired even than that of Attorney-General. But it must not be forgotten that the Lord-Lieutenant of Ireland, unlike a law officer,

has to maintain a Viceregal Court in Dublin, and to entertain freely, with the result that the drain upon the Lord-Lieutenant's purse will often swallow up more than the official income. His twenty thousand pounds a year, therefore, bear no relation to the nineteen thousand nine hundred and twenty-one pounds seven shillings and ninepence of the English Attorney-General, who is free from the 'social expenses' of the Lord-Lieutenant. Outside the Cabinet, no member of the Government, excepting the Lord-Lieutenant of Ireland, draws more than two thousand pounds a year, and there are only eight who can count on as much as two thousand pounds. Six take fifteen hundred pounds a year, and all the others have to be content with less, so that those who look to membership of the Government as a means of opening roads to wealth beyond the dreams of avarice must necessarily soon be disillusioned. None but the lawyers can hope to secure more than five thousand pounds a year, and only half-a-dozen can obtain as much as that.

But even when a member, by unceasing attention to ordinary duty and by the display of special gifts, has ensconced himself in office, he is still the creature of uncertainties and drawbacks that do not apply in any other walk of life. The contest between the two parties (the 'ins' and 'outs') is ever going on, and defeat may come like a thief in the night. Who would have thought that the humdrum discussion on cordite in committee of supply on that warm summer afternoon of June 1895 would have upset the Government? It may be said that that was only an accident, and that during the last twenty years the advantage of office has been overwhelmingly in favour of one party. That may be true; but all the same it would be unwise to count on finding fortune always on one side. In the first thirty years of the last century the balance of office and power went in favour of the Conservative party. From the Reform Bill of 1832 to that of 1884 the balance was on the side of the Liberals; and although it has since been on the side of the Conservatives again, he would be a bold man who would predict that it will always stay there. In the ordinary course of things a member of Parliament may be wise in concluding that his side may be in power for only the half of any appreciable period, and that the opportunity of taking office and emolument must be limited to that half or to something less than half. He may keep in mind, also, other considerations that are from the financial point of view almost equally deterrent.

The whole position is very clearly illustrated in the case of the Earl of Beaconsfield. That remarkable man first sought to enter Parliament in 1832, and it was not till 1837 that he was returned for Maidstone. From his first appearance as a candidate for Wycombe in the former year till his death in 1881, a period of forty-nine years, he was always in the public eye. From 1837 to 1881 he sat either in the House of Commons or the House of Lords, and for something like fifteen years he was the leader of his party. What, from the financial standpoint, was his reward? Altogether, he held office as Chancellor of the Exchequer or First Lord of the Treasury for periods which amounted in all to ten or eleven years, at the rate of five thousand pounds a year. In that time he could have received very little more than fifty thousand pounds. Yet in order to obtain a seat in Parliament, and to keep it, he had in the course of his career to fight seven contested elections and to present himself on nine other occasions for re-election. In those days election expenses were not limited as they are now, and almost anything might be spent. The probability is that in one way and another Mr Disraeli could not have spent much less than twenty thousand pounds in elections alone. It is reasonable also to assume that during the forty years that he sat in the House of Commons many calls were made upon his slender purse by constituents and others —and only members of Parliament know how much can be absorbed in donations, contributions, and subscriptions. If Mr Disraeli gave only two hundred and fifty pounds a year, he must, during his career, have spent ten thousand pounds in this way, making, with election expenses, thirty thousand pounds, and leaving, out of his aggregate emolument of fifty thousand pounds, only twenty thousand pounds for forty-nine years' strenuous work. Put in round figures, the whole sum only represents an average income for the time that he was in public life of something like four hundred pounds a year.

Or take the case of Mr Gladstone, who was in some respects much more fortunate than his formidable rival. Mr Gladstone entered Parliament as member for Newark in 1832, and, with a brief interval in the forties, he remained a member for one constituency or another till the date of his retirement in 1895, a period of sixty-three years. He was in office altogether for a period of about thirty years, and his financial emoluments cannot be put at less, to take round figures, than one hundred and forty thousand pounds. But during his career he faced fourteen contested elections and eleven uncontested elections, a total of twenty-five. That ought surely to be a 'record.' Probably his elections cost him from first to last not less than thirty thousand pounds; and added to that considerable sum must be the demands made upon him as a member of Parliament. In his case, as in that of the Earl of Beaconsfield, a town residence for the greater part of each year was an absolute necessity, involving what may be called a double domestic expense, and necessitating also heavy expenses in travelling. After making allowance for such obvious charges as these, it would be surprising if Mr Gladstone's emoluments from public work averaged more than one thousand pounds a year during the long period of sixty-three years that he devoted himself to the public service. And it must be remembered that he had the good fortune to be in public life while the parties to which he was attached were most favoured by the chances of office, while the

Earl of Beaconsfield during his career belonged to a party that in his lifetime tasted less than usual of the sweets of office.

A brief reference to the Marquis of Salisbury must suffice. As Indian Secretary, Foreign Secretary, and Prime Minister, Lord Salisbury held office about twenty-one years, at the uniform salary of five thousand pounds a year—say, an aggregate of one hundred and five thousand pounds. Well, Lord Salisbury entered Parliament as member for Stamford in 1853, and continued in public life till his retirement in 1902, a period of forty-nine years. His emoluments for the whole period of public service did not average much more than two thousand pounds a year. But, then, it should be said that while Mr Gladstone was constantly engaged in contested elections, Lord Salisbury never had to face a contested election in his life. From 1853 to 1868, when he succeeded to the peerage, he was five times returned for Stamford, and always without opposition. In another respect, also, Lord Salisbury was fortunate in that he led a party which, after 1885, was favoured by a long period of office, whereas his predecessor, Lord Beaconsfield, led the same party for a long time in opposition. But the great point which one would like to make is this, that the cases of these three statesmen are cited because they are the cases of the three greatest parliamentarians of the last half of the nineteenth century; and if it be asked what the three most distinguished men of their generation made out of public life, the answer is that, as detailed above, none of them made the income of a company director. These three are the men who, in the last forty years, have attained to the highest eminence in the State and rendered the State the largest service. Yet in the mere matter of money their reward has been almost beneath contempt.

In pursuing the inquiry further, however, one is confronted by the fact that some men have actually made great financial sacrifice in order to serve their country. Probably the Earl of Beaconsfield, Mr Gladstone, and the Marquis of Salisbury made sacrifices in this, that had they turned their brilliant gifts to other purposes they might, had they chosen, have amassed enormous wealth. What might not a man with Mr Gladstone's genius for finance have done on the Stock Exchange? But one would like to speak for a moment of men who have deliberately given up a career in which they were 'making' large sums. The late Sir W. Harcourt, his friends aver, was making fifteen thousand pounds a year at the Parliamentary Bar when he withdrew in order to enter Parliament as member for the city of Oxford in 1868. That income at the Bar might have been continued indefinitely, whereas Sir William gained exceedingly little, in comparison, from his service in the House of Commons. Another member gave up a lucrative practice at the Parliamentary Bar only four years ago in order to seek membership of the House—where, by the way, he has scarcely spoken at all; and yet another leader hopes to make the same sacrifice at the next general election by securing a seat in Scotland. For no one may practise at the Parliamentary Bar and be a member of the House of Commons at the same time.

Perhaps it may be well to explain for the benefit of the uninitiated why this is so, and why a member of the Parliamentary Bar is not as free as a member of the Chancery Bar or the Common Law Bar to enter the House of Commons. The reason is this. Every session a considerable number of private Bills are promoted by corporations, companies, and other bodies for carrying out such work as railway and electrical extension, the supply of gas and water, the construction of docks, harbours, piers, and so forth. These Bills are dealt with mainly by parliamentary committees; and sometimes, as in the case of the Manchester Ship-Canal, the railway extension which converted the Manchester, Sheffield, and Lincolnshire Railway into the Great Central Railway, and the water Bills promoted by the London County Council, they not only involve millions of capital in themselves, but touch adversely many powerful interests. Expert testimony of the highest kind relating to many aspects of finance, science, engineering, &c. often has to be met, calling for special qualifications apart from mere knowledge of the law and parliamentary procedure. It is obvious that when a man has established a great and brilliant reputation for conducting intricate work of this kind his services are in urgent request. Supposing, however, that amid this legal work a man decides to enter the House of Commons itself. Two objections at once arise. In the first place, he is liable with all other members to be empanelled to serve on one of these committees, and cannot both judge and plead; while, in the next place, to accept large fees on brief or refresher in order to try and induce his fellow-members to give a particular decision on a certain scheme would be highly improper. Thus there is a great distinction between work at the Parliamentary Bar and that in the High Courts, in which private interests alone are being pleaded for. All honour, therefore, to men who give up private work and private gain that they may take part in work in the House itself for the public good.

From what has so far been said it may be inferred that the public service as a money-making profession does not offer a very entrancing prospect, if regard be had simply to Ministerial office and the salary attaching thereto. On reflection, it may indeed seem strange that so many amiable and often well-meaning men should be found eager to undergo the toil of securing a seat in Parliament in order to be compelled during several months of the year to hasten away from their homes and occupations so that they may be in their places in the House at two o'clock, to remain tied during eight or ten hours a day to the dull performance of parliamentary 'duties,' and unable to leave them with confidence before midnight, lest a chance division should

decide the fate of the Government. Is there no recompense except that of office? There certainly is the possibility of a reward which so many members of Parliament prize—that is to say, the possibility of a peerage or baronetcy or knighthood, or one of the many other honours which it is in the power of a Government to bestow.

On looking back over such rewards as these that were given during the existence of the last Parliament—1895 to 1900—one sees that of members of the House of Commons eight received peerages, twenty were sworn of the Privy Council, sixteen were created baronets, and thirteen obtained the dignity of knighthood. Besides that, ten members of the House of Commons were in the same period appointed to judgeships of the High Court in England, Scotland, or Ireland. One was made a Master in Lunacy, and another Attorney-General of the Bahamas, while Lord Curzon (who then sat in the House of Commons) was made Viceroy of India. A few other members received knighthoods in one or other of the various orders of distinction, such as the Order of St Michael and St George. Excluding these last, the above list will show that no fewer than seventy members of the House of Commons obtained some honour or office of profit during the five years that the Parliament lasted. Most of those distinctions went to the party in power. As that party numbered about four hundred, it follows that, counting thirty offices in the Government itself, something like a hundred members of that party had office or other distinction, giving a proportion of one in four. If one were seeking for motive or for some ulterior purpose in those who enter parliamentary life, it would be the easiest thing in the world to take such a list and say, 'There is the explanation: one in four of all the members of the party in power have at least something to show for exertion or sacrifice.'

It is interesting to observe how large a proportion of members of Parliament prefer the honour of a Privy Councillorship. Twenty of the honours in the foregoing list took this particular form. While a Privy Councillorship carries the title of 'Right Honourable,' everybody knows that in practice this prefix is apt to be overlooked, and the Privy Councillor remains plain 'Mr.' It is not a hereditary distinction like that of a peer or baronet, and it gives no title to the holder's wife. Yet there is something about a Privy Councillorship that makes it widely coveted. In the first place, one who has been sworn of the Privy Council takes rank above baronets, Knights of the Bath, Star of India, and of all the other orders save that of the Garter, and above the Knights-Bachelor and judges. In certain functions of the State, notably on the accession of a new Sovereign, there are ceremonies which none below the rank of a Privy Councillor may attend. As most people know, the Privy Council is one of the most ancient bodies in the British constitution. In far-off days it acted as the High Court of Justice, and its Judicial Committee is still the highest court of appeal in the Empire. In matters of State it is still an executive body, the Crown issuing proclamations 'by and with the advice of the Privy Council.' At the same time, it must be said that as a complete body of over two hundred members it never meets, a few of its members connected with the Government of the day usually performing the duties that appertain to it. But there it is; and membership is a distinction of the highest order.

In the present Parliament there has been no falling off in the proportion of Privy Councillorships conferred. Here is a list of the honours bestowed upon members of the House of Commons from the general election of 1900 to date: five peerages, fifteen Privy Councillorships, eighteen baronetcies, fifteen knighthoods. This gives a total of fifty-three honours; while other things that have gone to members of the House of Commons in the same period have included a judgeship of the City of London Court, the Deputy-Mastership of the Mint, the post of representative of the British Government on the Council of the Administration of the Suez Canal, and an important appointment in the Consular Service—all valuable posts. This shows that the average of rewards in the present Parliament is quite as high as that of the last. In the five years of the last Parliament about a hundred members received some office or distinction. In the four years that this Parliament has lasted about ninety members have received office or distinction.

During both the periods spoken of, the honours were bestowed by a Unionist Government. But let it not be supposed that there is any falling off in the relative number when the Liberals are in power. In the three years 1892–95, when the Liberals last held office, there were given to members of that party eight peerages, four Privy Councillorships, fourteen baronetcies, and eleven knighthoods, with such honours as a Grand Cross of the Bath, a Grand Cross of the Star of India, and a Knighthood of the Bath. Appointments included a Lord of Appeal, two Lords-Justices of Appeal, the Recorderships of Sheffield, Manchester, and Swansea, the post of Charity Commissioner, the Chairmanship of the Scottish Fishery Board, and the Governorship of New South Wales. Altogether, something like fifty honours and appointments were conferred in three years by the Liberal Government, to say nothing of the offices in the Government itself. The offices in the Government bring the total up to over eighty, which, for a period of three years that the administration lasted, gives a higher rate than that for the two Unionist Governments that have since been in power.

In the twelve years that have passed since 1892, no fewer than one hundred and eighty members of the House of Commons have received some honour or appointment apart from membership of the Government itself. Why were some of the honours conferred? Effort is sometimes made to obtain with the announcement of an honour a statement of the

reasons for bestowing it; but the demand has always been resisted, and the world has been left to draw its own conclusion. But one cannot help feeling that it is easier now to obtain, say, a knighthood than it used to be. Raleigh and Drake, for instance, rendered service that practically saved the nation, and their efforts were rewarded by a knighthood each. If the peerage alone is considered, it will be found that of all the peers created in the last twenty years—rather more than a hundred—over three-fifths have served for a longer or shorter period in the House of Commons. For that service chiefly they have been raised to a position in the Second Estate of the Realm, with a title that will be perpetuated as long as their male posterity endures. If we look to that fact, and to the large number of Privy Councillorships, baronetcies, knighthoods, and other titles bestowed on members of the House of Commons, it seems clear that, apart from the holding of Government office and from any financial emolument, there are great prizes for public service, and that any one who has means and leisure to devote himself to a political career has a very fair chance of securing one of them.

GIANT CIRCUMSTANCE.

By JOHN OXENHAM, Author of *Barbe of Grand Bayou, Bondman Free, John of Gerisau*, &c.

CHAPTER XIII.—THE CURE SPREADS.

I AM not going to trouble you with a detailed account of Geoffrey Carrick's experimental work on the raw material and waste-product of the Empire. But, inasmuch as it occupied much of his thoughts at this time, and proved a wonderfully efficacious antidote for the blues which chilled his outlook on life as soon as he returned to town, a passing reference must be permitted now and again.

The work of alteration and adaptation had gone on famously in his absence. What with Colonel Trevor and Sergeant Connacher and Brading, the various workmen had had a time of it! They had had their noses kept to the grindstone in a way that had a deleterious effect on some of them for the remainder of their lives; for all subsequent lazyings were palliated with the reflection, murmured as a rule into an empty pewter with a melancholy wag of the head, 'That *were* a time! D'ye mind yon old bloke with the wooden leg, Jim, on that old house in Grattan Street? My eye, he were a Tartar! Nigger-driver was what he'd ought to ha' been, an' old Bagpipes was another of the same.'

So we may take it that the work owed much to Geoff's assistants in his absence, and that the fact that the great transformation was set in all its completeness, and waiting only for the curtain to rise, was due to the exertions of the military contingent, which had done its best to instil into the British working-man some of its own notions of duty and service.

For weeks the interest of all that neighbourhood had been centred on that house. There was no need to advertise its intentions. They had been discussed and disputed and fought about till every eligible member was hall-marked with visible signs of argument, and on the bubble for the opening night. For one had seen loads of gymnastic appliances going in, another had seen heaps of basket-hilted sticks, and another swore that he had watched the discharge of a cartload of rifles—real up-to-date breechloaders. But he was not believed, and suffered the fate of the too-advanced romancer.

When at last the keen-eyed scouts found a sheet of paper pinned to the door, with this brief announcement in Sergeant Connacher's stiff handwriting: 'Headquarters. Open Wednesday Night, 7 P.M.,' the word sped round the tribes as news flies through the desert, and seven o'clock Wednesday found the door besieged by a motley and disorderly multitude.

Prompt to the second the door swung open, and the eager-faced ones swept in, to the endangerment of Sergeant Connacher's life between door and wall. The advance-wave gasped with surprise, felt suddenly dirtier than usual, then hauled off its varied headgear in a quite unusual accession of confusion at the sudden jerk on to a higher plane than it was accustomed to, and slid into the first seat it could find, with its tongue deprecatingly in its cheek. For the room was filled with long trestle-tables and forms, and the tables were filled with good things, and, moreover, had white cloths on. And it was a fine bright room, panelled in pitch pine and unusually well lighted. From the roof depended ropes with cross-bars and rings; at one end were ladders in various unusual positions, and heaps of other puzzling things; on the wall a great row of fencing-sticks with basket-hilts, and—crowning glory to which every eye drew as to a magnet—a long rack full of rifles with shining stocks and barrels. And he who had suffered by reason of these exulted greatly, and showed it. There was also a piano in one corner—'Law, Bill! Ketch on to ther pianny! Music lessons free! Step along and try yer voices'—which excited much comment, but whose use presently became apparent.

At the far end of the room Geoff and his friends awaited their guests. Colonel Trevor was there, uniformed and bemedalled, and full of satisfaction

at the result of his labours as clerk of the works. Tom Brading was there, smiling almost as broadly as Mrs Connacher, who looked matronly enough to mother the whole company. Lord and Lady Exmoor were there, Exmoor in his naval plumage, and both looking as happy as the happiest newly married couple in the world should look. And last, but by no means least, save in the utterly inconsequential matter of mere size, Captain Dicky Bantam was there, a very great man indeed.

They all got settled down at last, with a little squeezing, for more had come than had been expected; and then Sergeant Connacher's voice rang out as it had rung out in wider and much less pleasant places, and every boy of them jumped in his seat and did what he was told.

'Tenshun, boys! All stand! For what you are about to receive, the Lord make you truly thankful! And that means a sight more than what's on those tables. Sit down!'

Then Mrs Connacher beamed off into a side-room, and in a moment great tin coffee-pots came rushing out like fire-buckets, and army and navy and the navy's wife sped round with them and bade the guests fall to with such hearty invitation that shyness almost vanished and tongues were unloosed. For that coffee did you good just to smell it, and the good things on the tables, though nothing extraordinary, were a treat.

Captain Dicky slid round too among his friends —and enemies—they were all friends to-night; and Mr Squeaker and the rest, who had met Carrick and Trevor at the hospital, gained great *éclat* by the recognition accorded them, and made great capital of their acquaintance.

'That's Cap'n Carrick, just 'ome from Soudan. No; 'im with ther light moustarch. 'Twere 'im carried Dicky off that night.'

''Im with the medals and the stiff leg? 'E's Colonel, V.C. Left 'is leg in Crimea.'

'That other's navy, you bloke! Don't know who 'e is. That's 'is wife, I guess. A1, ain't she?'

And so on, and so on.

When Tom Brading had been out four separate times for extra supplies, whereby several distinct species of novelty were introduced into the faring, and they had all had as much as they could comfortably stow at one sitting, the tables disappeared with the assistance of many willing hands, the forms were lined along the walls, and the company—such a grotesque mixture of tangled heads and bright eyes and rough faces—stood facing Carrick while he gave them a few hearty words of greeting and explanation.

'Well, boys, will it do?'

'Yus, sir!' in a hurricane of keys and tones, but all very expressive, and winding up with a shrill 'Prime!' from the Squeaker.

'Well, now, at most feasts there are certain observances, and we can't do better than follow them. It is usual to remember the Great Giver of all good things. That you have done. Then it is usual to stow away the good things. That you have done. And then it is usual to toast Her Majesty. So, if you please, we will sing "God save the Queen," and see that it goes with a swing.'

Ellen sat down to the piano and struck the chords, and the neighbours for several streets round heard it go with a swing.

'Thank you!' said Geoff. 'It always does one good to hear it sung like that. The last time I heard it was at Tembé Wells, in the Soudan. We had had a hot time of it. It was almost touch and go with us. But when the dervishes turned tail and bolted, some one in the square started "God save the Queen," and I tell you we sang it! Now about this place. When Dicky Bantam and I discussed the idea'—conscious look from Dicky—'Dicky's first question on the subject was, "Any preachin'?" and my reply was, "No preaching!"'

''Ear! 'ear!' and 'Good ol' Dicky!'

'We're not going to preach to you. But, all the same, we're going to give you the chance to make men of yourselves. Dicky's next question was, "Any smokin'?" and my reply was, "Smoking if you want to; but if you'll take my advice you won't smoke till you've got your height. For if you smoke young you never will attain to your full stature and be big, strong men. But there will be no compulsion in this or any other matter."'

''Ear! 'ear!'

'This place is intended as headquarters where you can meet and talk and do anything you want, and the only passport to admittance is good behaviour and cleanliness. And, by the way, the idea of this place sprang out of that fight among you in which Dicky Bantam got his leg broken.'

'Good ol' Dicky!' 'Good ol' leg!' 'Break the other, Dicky!'

'If you want to fight, come here and put the gloves on, and we'll show you how to do it properly. But, mind, no kicking here. Kicking's not the game. Well, upstairs there are rooms for games and reading. In there is a canteen where Mrs Connacher will supply light refreshments at ridiculous prices. There will be drilling-classes for all who want to join, fencing-classes, rifle-drill. When we have shaken down a bit we'll try a band, if you like. There's a room at top of the house just made for band-practice. In the basement there are lavatories and bathrooms. Later on, also, we will think about a uniform and march-outs, which Dicky was strong on, and, if you feel inclined that way, I've no doubt we could manage a fortnight's camp at the seaside in the summer.'

''Ear! 'ear!'

'Sergeant Connacher, who was through the Crimea and Indian Mutiny, will be commandant here. Only mutineers need fear him. You will find him and Mrs Connacher as good friends as any boys could want. Now I want you to give three cheers by way of thanks to Colonel Trevor and Sergeant Connacher and Tom Brading for getting this place in order while I was away.'

And they gave them till the roof shook.

'Who's the other bloke—the navy man?' shrilled the Squeaker, whose small head was getting a bit turned.

'The other bloke—the navy man—is my brother-in-law, Lord Exmoor. You will know him better as Lord Charles Doone of the *Terror*.'

Know him? The neighbours for four streets round knew it by the wild shriek of rapture that went up at his name. Hurrahs, whistles, and stampings. The transformation repairs to that house had been excellently well done or the roof would have gone up and the floor given way.

Exmoor laughingly sprang up on to a chair, and the boys thought he was going to speak to them. But all he said was, 'Now, boys, three cheers and a tiger for Captain Carrick! Hip! hip!'—and the neighbours for five streets round heard what they thought of Captain Carrick.

'Three more for the lydy,' from Mr Squeaker again.

And as soon as they had subsided, Sergeant Connacher and Tom Brading mounted the platform at the end of the room, and the sergeant put grinning Tom through a severe course of bayonet and rifle drill while the spectators got their breath.

Carrick had been looking at his watch several times and watching the door.

'Any of you like a round with the gloves?' he called out. 'There is a gymnastic professor coming shortly to show you the meaning of all these things, but he's a bit late.'

None of them, however, in spite of much friendly hustling and neighbourly exhortation, could muster courage to play gladiator before so large a company. So, to pass the time, Carrick and Exmoor divided them into two companies, Ellen sat down to the piano again and played quicksteps, and the two men led them round in a follow-my-leader fast trot, in and out and round about, till through some mischance they got inextricably tangled and broke off in shouts of laughter. By that time the gymnast had come, and he soon had them all agape with envious emulation as he swooped and swung and twirled on rings and trapeze, did deft tricks on horizontal and parallel bars, and whirled Indian clubs about in mazy evolutions from which his head issued unscathed as by a miracle.

Then they were given the freedom of the place, and they prowled away upstairs and downstairs under Captain Dicky Bantam's guidance, till they felt themselves almost as much at home as Dicky himself; but not quite, for Dicky was to live on the premises and act as aide-de-camp to Sergeant and Mrs Connacher, and he would not have changed places and prospects with any man in London that night. They learned also that the gymnastic instructor was to come two nights in the week to put them up to things, and they could begin at once if they liked; and some of their coats were off in a twinkling, whereby 'Mr Gym' was highly flattered, and expressed the opinion that he'd very soon work their flab into muscle.

It was all very wonderful, and they found it hard to realise that all this was to be theirs every night in the week if they chose. And the very thought of it planted new seeds in many a rough little heart and set it aspiring to better ways than any it had hitherto known.

'Geoff, my boy,' said Exmoor as they walked home that night, 'I've a kind of idea that you've struck oil in Grattan Street.'

'You've given a great many boys a great deal to think about,' said Ellen.

'I think we all enjoyed it as much as they did,' said Geoff.

'I can speak for four,' said Colonel Trevor. 'We'll make little men of those boys yet, and they'll live to bless Captain Dicky Bantam's broken leg and what came of it. It's a great work you've set your hand to, my boy, and I'm going to keep my finger in the pie.'

(*To be continued.*)

THE NATIONALITY OF FISHES.

By F. G. Aflalo.

If the fisherman puts before himself a blank map of the world on what is known as Mercator's Projection, and thereon jots down some of the known geographical limits of sundry groups of fishes, he finds himself confronted with strange problems. With a fish in a pond it is the same as it was with General MacMahon in the Malakoff: '*J'y suis, j'y reste.*' How any kind of fish originally found its way into a landlocked water without present outlet is a question that can be answered only by a careful investigation of whether some outlet did not previously exist. The species may have been introduced by man, or, like Topsy, it may have got there no one knows quite how. But of its remaining—since, unless released by a flood, or suffocated by a drought, or snatched by an otter, or caught by an angler, it has no choice—there can be no shadow of doubt.

A similar restraint, less only in degree, keeps the greater part of river-fishes to their native water; for, with a few known exceptions, they are unable to survive in the brine. The eel, it is true, goes down to the sea to breed; and the salmon and sea-trout, which may be a valid species or a form of brown trout, travel backwards and forwards between the head-waters and the open sea. But the case of the salmon family is a special one, and men of science

are even divided in opinion as to whether the family was in the beginning marine or domiciled in the inland waters. At any rate, several of its members divide their time between the two. These salmonoid fishes belong, with a single exception, to the waters north of the equator. The exception has a special interest for the fisherman with geographical knowledge, for it is a small New Zealander of slight economic importance, but attractive on other grounds, since its natural occurrence in the rivers and estuaries of that distant colony makes it an error to regard the acclimatised trout as the first member of the salmon family to live in these waters. What is perhaps even more interesting to the student of distribution is that the little fish (*Galaxias*) which the early settlers in that country called 'trout' is not a salmonoid at all, but is so dispersed over the Mercator map as to puzzle even the learned. It is truly the most southern of fresh-water fishes, for the thirtieth parallel south determines its northern range, and it is in fact found only in the streams of Cape Colony, Patagonia, and the Falkland Islands, and in the southernmost waters of Australasia.

The case of sea-fish looks at first sight distinct from that of the dwellers in rivers and lakes, for the free and open ocean seems without interruption from the North Atlantic to the South Pacific, and the uninformed might be tempted to expect to find the same fishes in both hemispheres: the schnapper and barracoota sporting round the Eddystone, and our plaice and pollack in the fish-shops round Sydney Harbour. But those who have fished in both places know how different is the harvest of the sea ten thousand miles apart. The visitor at Margate is told by the inevitable longshoreman, who always tenders such lore in return for potential draughts of home-brew, that if he stands at the pier-head and faces just west of north he is looking straight across at Greenland. What is more certain is that you can stand on the Land's End, and, in imagination, gaze across four or five thousand miles of sea to the coast of South America without a single charted island between. Yet between Penzance and Paramaribo considerations of temperature impose barriers in the path of the restless fishes as forbidding as if they were walls of rock.

Even in so small a tract of sea as that which lies around the island in which we live, there are apparently impassable barricades. The wolf-fish, whose ugly head may be seen on most days of the year at Scarborough market or Berwick quay, would probably attract a crowd if exposed for sale on Plymouth Barbican. *Per contra*, the pilchard, which shoals in its hundreds of thousands in Cornish moonlit bays, is rarely, if ever, seen alive on the coast of Yorkshire. The mackerel seems to resent a Fahrenheit temperature appreciably below forty-five degrees, and the greater mackerel-fisheries consequently belong to the southern shores of Britain and Ireland, whereas the herring is more in evidence in the northern waters. Two other northern forms of great interest are the bergylt and torsk, the former being also known as 'Norway haddock,' and though neither a haddock nor particularly characteristic of Norway, it is often brought into Grimsby from the North Sea grounds, and is occasionally taken in the Moray Firth. To the naturalist its chief attraction is that it brings forth living young, a method of reproduction common to very few British fishes. The torsk, which reaches a weight of over forty pounds and a length of forty inches, is a well-known Shetland fish, excellent eating when fresh, but known in more southern markets in the dry state only. It is a slimy fish to the touch, owing to the minute size of its embedded scales, and it has the beard distinctive of many members of the cod family. Mr C. O. Minchin, an angler with experience of many seas, tells me that the longshore-fishermen of Coll, in the Hebrides, had never seen torsk before one occasion when he was present. In Norway the name is applied indiscriminately to several small allied fishes of the cod tribe, having affinities no doubt with *dorsch*, a small codfish that I saw every day during a winter on the shores of the Baltic.

Perhaps the most extraordinary case of what we may call overlapping distribution is that of the three top-knots, commercially insignificant cousins of the plaice. Three of these are found on one part or other of the eastern seaboard of Britain, but one only enters the Mediterranean, occurring nowhere north of Shetland; a second ranges to the Arctic Circle, but ceases south of the Bay of Biscay; while a third, with an extraordinarily restricted domain, occurs only between the English Channel and the Norwegian coast. Some allowance must be made by the open scientific mind for accidents of capture; but the results of very many dredging expeditions warrant the foregoing account of the geography of *Zeugopterus*, which is the more dignified equivalent of the trivial name.

A more appreciated cousin of the top-knots is the sole, and it is a fact that the delicate sole of the more southern portions of the North Sea and of the littoral of the English Channel is almost entirely replaced in Scotch waters by the much less agreeable lemon-sole. This it was, no doubt, which induced Professor M'Intosh to transplant some living soles from the coast of Northumberland to Scotch waters. Whether his experiment has resulted in the supply of the genuine article for the 'sole' of Edinburgh hotel menus, I have not been in the northern capital recently enough to learn. Mr Dannevig made a similar essay to acclimatise North Sea plaice in the bays of Australia, with what success is also as yet undetermined.

That the Strait of Gibraltar, however formidable to the warships of Britain's enemies, should stop the passage east or west of migrating fishes looks at first sight impossible. Yet neither the cod nor the herring, both plentiful in the North Sea and the Atlantic, enters the Mediterranean, though a near relative of the herring, the pil-

chard, known in southern markets as the sardine, is abundant in that sea.

One or two of the world's seas approximate the conditions of lakes, with the water either very salt (as in the Dead Sea), very fresh (as in the Baltic), or almost normal (as in the Black Sea). Each of these has its peculiarities for the fisherman. The Dead Sea, subject to continual evaporation, is highly saline, and its asphaltic water is so baneful to fish-life as quickly to suffocate any fishes washed down when the Jordan is in spate. In the neighbouring Sea of Galilee, on the other hand, the fish are almost as plentiful to-day as at the time of the miraculous draught; among the more common kinds being a cat-fish, which makes itself at home in the baked mud when the waters of the Holy Land are dried up by the burning sun. Visitors to the fish-markets of Nazareth and Safed are frequently struck by the proportion of fish minus their eyes. This is the work of pelicans and fish-hawks; and, though it is ascertained that the eyes must have been gouged out when the fish were young, the loss of their eyesight appears to be no bar to an otherwise prosperous condition. It has been pointed out that many kinds of fish are common to the Jordan and the Upper Nile, and it would look as if these fresh-water fishes were dispersed, by some line of communications since destroyed, from a centre of distribution that has probably contracted to the water which we know to-day as Lake Tanganyika. The Nile, like most African rivers, is not rich in important fishes, though Mr Boulenger has of late years described collections of great interest to science. In the rivers of Morocco I never succeeded in finding anything superior to eels and barbel, though shad regularly enter some of the estuaries, and there are said to be trout in the streams of the Atlas. As to the Nile, the late Charles Williams, who served as war correspondent on three Nile expeditions, once told me that he had seen only three kinds of fish caught in that river. One, a small bream-like fish, was useless as food. A second, which made a passable dish when there was no choice, was a siluroid, which Thomas Atkins became expert in catching on an ammunition hook baited with bully beef. A third, which looked something like our mackerel, though lacking the bars, he saw caught on a stern-line from one of the river-steamers.

The Baltic, which lies in latitudes too cold during the greater part of the year to promote evaporation, receives immense fresh-water rivers. Hence its fishes are closely allied to riverine forms in some cases; and, with a few notable exceptions, its cod and herrings are dwarfed by comparison with the more robust races taken in the North Sea nets.

The Black Sea has a bed so thickly strewn with deleterious sulphur compounds that the lower strata of the water are permeated with sulphide of hydrogen. Now, the eel spawns only at great depths. This is perhaps the reason of its leaving rivers to spawn in the sea. As the uttermost depths of the Black Sea are poisonous from the cause here indicated, there are no eels whatever in that sea, though many of its other fishes are of great commercial value to the Russians.

Two other cases of apparently inexplicable distribution, analogous in some respects with the afore-mentioned association between the Nile and the Jordan, are those of the surviving lung-fishes and arapaimas or osteoglossids. Only three genera of lung-fishes survive out of at least double the number, and of these one occurs only in South America, one only in Africa, the third only in a couple of rivers of Queensland. None exist in either Europe or Asia, and indeed the range of the three in question is in each case very restricted within its own continent. The arapaimas are found only in the Brazilian region, in Central Africa, and in Sumatra, Borneo, and Queensland. The osteoglossid of the last-named country is known by the name of *barramunda;* but I found that this name was very carelessly applied to three very divergent forms: the osteoglossid, the lung-fish (*Ceratodus*), and the giant perch.

The distribution of the salmon family has already been referred to. A very curious and interesting episode of salmon itinerary is seen in the joint estuary of the Avon and Stour at Christchurch, in Hampshire, where 90 per cent. of the fish ascend the former river. This is intelligible only to any one who knows the difference between the limpid Avon and muddy Stour. In like manner, the salmon and trout of Belgium both prefer the clear waters of the Meuse to the discoloured floods of the Scheldt.

There is an insignificant little fish, in appearance not unlike a diminutive perch, known in Britain as the pope or ruffe and in France as *grémille.* For some unaccountable reason this small fresh-water fish is growing scarcer in the rivers of Spain and Italy. In France, on the other hand—where, if we may judge by the silence of Belon and other early writers, it was unknown previous to 1777—it seems to be becoming more plentiful every year in the Seine, Aube, Yonne, Meuse, Garonne, and Dordogne.

Thanks to the inquisitive research of modern science, we know approximately what kind of fish to expect in every quarter of the globe, though the extreme depths of the ocean are likely to retain their jealously guarded secrets for a long while to come, in spite of the latest improvements in dredging apparatus. The rivers of Africa, like the lakes of New Zealand, have in great measure been mapped out by the ichthyologist; and in the last the enterprise of the Anglo-Saxon has repaired the omissions of Nature, with the result that these waters now yield splendid fish undreamt of by the primitive Maori.

Man's share in distributing living fishes is considerable, even apart from such unforeseen and unconsidered accidents of engineering as that which,

through the Suez Canal, opened the Mediterranean to the sharks of the Red Sea. His planned interference in the natural range of fishes has been attended by variously desirable results. French and Belgian anglers are not to-day so unanimous as they were in respect of the merits of the American cat-fish, introduced into their rivers with such enthusiasm a few years ago. If America has sent her undesirables to European waters, has she not also given hospitality to other suspects travelling west? The carp, first introduced experimentally into Lake Erie by the United States Fish Commission, has made itself at home to such purpose that that lake alone is said to give an annual yield of three million pounds weight! Yet, however satisfactory it may be on commercial grounds, American sportsmen look askance at the carp, for the bass-fisherman says that it devours the spawn and fry of his favourite fish, while the duck-shooter declares that it ruins his prospects by tearing up the weed and fouling the water, the ducks being driven elsewhere by such outrage.

Save for occasional experiments with rainbow trout, we do little acclimatising of exotic fish in this country, the work of our fishery boards being rather directed towards preserving our indigenous species and eradicating pike and coarse fish to make room for trout. The Salmon Board of the Yorkshire Esk has of late been much exercised by the proposal of a riparian owner to introduce into that river the grayling, a favourite fish with anglers in other parts of the broad county. It is doubtful whether the Board would have power to interdict a riparian owner minded to introduce what is recognised as a game-fish; but there can be little question about the Esk being a 'hungry' river as it is, the existing salmon and trout having none too much food. The introduction of grayling, then, apart from the complication in the fishing seasons, since the open time for grayling does not correspond with that for trout, is likely to make the case of the prior occupants harder than ever.

These attempts to edit Nature, regarded from the standpoint of sport, will be condemned by the angling masses, however warmly they may be supported by men of means and leisure. The reason is obvious. Working-men anglers, accustomed to coarse fishing, have neither the money nor the inclination for fly-fishing; and the pike, the usual object of extermination, is one of the poor sportsman's favourite fish. It is fatal to fly-fishing for more reasons than one, for not only does it prey on the trout-fry, but its presence among the reeds prevents the larger fish from rising to the fly as surely as a falcon or artificial kite overhead keeps the partridges crouching in the stubbles. The predatory pike, which (on paper) keeps on one side of an imaginary line drawn across Scotland, is, like the pugnacious stickleback, a fish of northern latitudes only. The pike tribe occurs nowhere south of Italy (not even in Sicily) in Europe, and the stickleback ceases south of Algeria. The range of both families in the New World is of latitudinal coincidence with these limits. But, as was already suggested above, there is nothing incomprehensible in the limitations imposed on these fishes of fresh-water. It is when we find the marine forms obeying a mysterious injunction of 'Hold! no farther!' that we have to catch our breath in amazement.

SMUGGLERS' TRICKS.

By S. Baring-Gould.

SMUGGLING effectively is one of those fine arts that has decayed, at least in England, where, as we have duties on little else than tobacco, tea, and spirits, and where we have a seaboard closely watched, it cannot be carried out to any extent successfully. Now and then the revenue men are outwitted, but rarely on a large scale, and never can a contraband trade be carried on for long undetected. It is not at the present day worth men's while to apply their minds to the overreaching of the coastguard, and consequently the art is in its dotage and decline. Attempts are made occasionally to outwit the preventive officers, as when a vessel came into the Colne some years ago with its cordage of twisted tobacco; but it was found out. Oil-cans are made, or were made, with the interior consisting of an inverted funnel of tin. When the officers put in a stick through the neck, and turn it about, they draw it out and find that the rod has been in oil. But the upper bulging sides of the can contain smuggled spirits.

An old woman died lately at Causand, who for long hoodwinked the coastguard by carrying about a baby. This was actually a bottle or jar of brandy, which she drew off from a hidden receptacle of the smugglers. 'You've a very quiet child there; I never hear it cry,' said one of the guards to her. 'That may be,' replied Nanny; 'but I warrant you he's got a deal o' spirit in him.' And he let her pass.

In Gower, at Llangenneth, the runners of smuggled goods had contrived a most ingenious *cache*. A little stream falls in cascades from the mountain above. They diverted the stream, formed a cellar under the spot where the water splashed down, well covered with broad slates above, on which they cast torrent rubble, and in this hid their kegs. But a storm brought the stream down with such violence that one night it tore away the roof and revealed the concealed run goods. In many a farmhouse near

the coast throughout England the chimneys were constructed so as to have a chamber in the depth of the wall, entered through a hole some little way up the chimney; and many a so-called priest's chamber in an ancient mansion, though it may have served as a hiding-place for a Roman chaplain, most certainly served more frequently as a cellar in which to stow away contraband spirits. For the gentry were, in a large number of cases, quite willing to connive at the proceedings of the 'free traders.'

A certain baronet in South Devon, who died not so long ago, was shrewdly suspected of being hand-in-glove with these gentry. At last the officers were constrained to pay him a domiciliary visit. 'By all means,' said the baronet, 'search high and low; here are the keys of my cellars, and here also of the attics.' The functionaries made a good search, and discovered nothing. They had omitted to examine the old yellow-bodied family coach, which all the while was crammed with kegs.

But if the art is in decline to death in England, this is by no means the case on the Continent. In France there are not merely the frontier ports watched, but each town has its *octroi*, and food and liquor entering have to pay a toll, which takes the place of our rates. There is, accordingly, an incessant effort made, not at the frontier only, but in every town, to outwit those who watch to impose a duty or a tax.

There was a local Mrs Jarley who went about with her waxworks in the frontier towns of Belgium and France; and every one of her figures was a receptacle for spirits or Mechlin or Valenciennes lace; and a roaring trade was done by this means, and might have continued had not the manageress of the show quarrelled with one of the underlings about some small advance in wage.

'No such a being exists as a *small* enemy,' said Talleyrand; and so this fellow proved. He betrayed the whole thing. Next time that the waxworks passed the frontier the figures were examined. The Sultan of Morocco, though strictly forbidden by the Koran to take fermented liquor, was full of cognac; Rousseau, with the *contrat social* in his hand, was packed with lace; Fénelon, Archbishop of Cambrai, had his bosom and his mitre charged with English silks; Marat, bleeding in his bath, was full of English jams, even sugar; and Charlotte Corday was nothing other than a great case of comfits.

Perhaps one of the cleverest and boldest attempts to outwit the Customs officers was perpetrated after the battle of Lützen, in which Marshal Bessières was killed by a ball. Some cunning smugglers on the Rhine, having heard that the deceased marshal's body was to be conveyed to Paris, there to be buried, hastily got up a funeral convoy, with a coffin stuffed with English goods and accompanied by a carriage on which were painted the armorial bearings of the deceased, and a disguised smuggler as a hussar, and pretended mourners, came to the frontier. The aide-de-camp, with crape on his arm, presented credentials, forged of course, and demanded to be allowed to pass. But the head of the *douaniers* hesitated. He demanded to have the coffin opened. The aide-de-camp and the mourning cortège protested indignantly; and a compromise was agreed to, that a post should at once be sent to Marshal Kellermann to know whether the coffin was to be allowed to pass unexplored. The gallant officer sent word at once that no examination was to be made. But in the meantime arrived an outrider to announce that the funeral train of Marshal Bessières was on its way. What? two bodies, and two funerals! The *douaniers* at once unscrewed the coffin, and the sham aide-de-camp and the pretended mourners took to their heels.

At the time when Napoleon was enforcing the Continental blockade against English goods he had all warehouses in the ports examined, and if anything English was found it was taken into the market-place and there burnt. Now, at Antwerp a merchant had his stores filled with English printed cottons, muslins, and other materials. The seals were affixed to the door, and perquisition was to be made on the morrow. But the good man had a secret entrance to his warehouse, and during the night he and a number of workmen emptied his bales of the English materials, and stuffed them with old sailcloth, rags, paper, old mats. Next day the officers arrived, carried forth the bales, and made a great bonfire of the whole.

At one time Portuguese gold was worth more than Spanish, and the Custom-House officers watched the frontier to prevent the introduction into Spain of this gold.

One night some *contrabandistas*, carrying a good deal of this gold, were in the forest of Ledesma, near Ciudad Rodrigo, and lodged in a tavern there, when a spy brought them news that the Customs officers were after them. They had to fly, but confided the gold to the hostess, Doña Lopez, who at once secreted the bags about her body, attaching them to her stays. But the amount weighed so heavy that she could hardly move.

In came the officers of Government, and demanded of her where were the smugglers.

'The men have been here,' she replied, 'but have gone again. This is a tavern, and I am obliged to take in whoever comes for shelter. I ask no questions, so am told no lies.'

'Well, we must search the house.'

'Search if you will, but don't worry me. I tell you the men are gone, and as they were heavy laden they cannot have run far.'

Nothing having been found in the inn, the officer in command said, 'Come, *doña*, get up out of your chair; we must search that.'

'Indeed!' she replied; 'what next? Don't you see how fat I am? My fat makes me sedentary. It is as much as I can do to roll from my bed to my chair, and back from my chair to my bed.'

Not till some years later did the secret come out how she had concealed the smuggled gold.

At the time when Joseph Bonaparte was king of Spain a good many individuals, even highly placed, enriched themselves at the expense of the revenue.

One day a *contrabandista* met a brigadier at Segovia, about to return with empty caissons to Madrid.

'Look here, my friend,' said he, 'I want you to convey for me a quantity of cannon-balls and shells to the capital—as many as your horses can draw.' Then he showed him piles of these munitions of war. The brigadier demurred; the weight would be prodigious. 'Bah!' replied the smuggler. 'They are all of blackened pasteboard, and are full of velvets, tobacco, brandy, and liqueurs. Get them safe into the Prado, and you shall be paid for your pains seventy-five louis d'or. They will let cannon-balls past the barriers without taxing them.'

The brigadier agreed, and managed to get them into the Prado at Madrid in the night; but as those in the plot were unloading the goods up rode an officer.

'Hallo!' said he. 'The very thing we want. I have orders to send a convoy of shot to Seville, wanted against those dogs of English.' And he confiscated the lot; but, finding them remarkably light, broke one, and forth gushed the finest cognac.

In Paris, for some time, by an ingenious contrivance, a good deal of wine and spirits was passed beyond the barriers without paying duty. A subterranean passage had been made from the village of Les Vertus, near St Denis, in the house of a citizen, and it led into the cellar of a blacksmith near the Foire St Laurent. The passage was lined with planks well greased, and kegs were sent rolling along it, filled with every kind of merchandise that ought to pay toll at the *octroi*. At the blacksmith's there were extensive cellars, in which these goods were stored. But one who was in the secret betrayed it, and the officers of the law came down suddenly on the blacksmith, penetrated to the mysterious cellars, and with the contents loaded seventeen wagons.

At the present day a great source of annoyance to the Spanish frontier guards is the extensive smuggling that goes on from Gibraltar, and dogs are trained as the mediums. They have laces and all kinds of English produce sewn round their bodies, and are let loose. They know perfectly whither they are to go; and the guards fire on all such dogs as they see coursing over the country. In the same way, in Perigord, dogs are educated to poach truffles, which they dig up and hide in known *caches*, where their masters can recover them.

On the Swiss and French frontier an Italian plied his trade. He had a bear, and a monkey that sat on the back of Bruin. Sometimes he was in France, sometimes in Switzerland. But actually the beast he travelled with was an ass. Tin receptacles had been formed adapted to his sides and back, and these were filled with brandy, and the whole was covered over with the skin of a huge bear.

As the showman with his beasts passed the frontier one day, as ill-luck would have it his bear gave voice.

'Hallo!' said the Custom-House officer; 'what a very remarkable Bruin that brays like a donkey!' and so the trick was discovered.

There lived near the French frontier a learned ornithologist, who not only himself had a collection of rare stuffed birds, but he also was consulted by amateurs and by learned societies throughout Europe when collections were sought to be made up; and he undertook to procure the specimens that were desired in France or Germany or England. Consequently there was constantly going on a trade in ornithological specimens over the frontiers, and usually our *savant* accompanied these, as they were rare and valuable, and liable to injury if roughly handled. Now, it so chanced that he bought a live parrot, with which it entertained him to converse. After a meal he would stand by the perch and say, 'Poll! pretty Poll! When you are dead I will stuff you with laces,' or else, 'Poll, I will stuff you with eau de Cologne.' Now, it fell out that once our naturalist was conveying a collection of specimens across the frontier, and, unluckily, he had his parrot with him. At the Custom-House, all at once it screamed out, 'Pretty Poll! When you are dead I will stuff you with lace! Poll! Poll! when you are dead I will stuff you with eau de Cologne.'

'I will trouble you,' said the Custom-House officer, 'to let me investigate your collection of stuffed birds.'

'Ay!' said the ornithologist bitterly. 'Pretty Poll! I shall wring your neck for telling secrets.'

The Austro-Bavarian frontier from Passau to Eger runs along through a forest land, the Bairischerwald and the Böhmerwald, and this has to be watched, with stations at short intervals. One of the *Zollbeamter* or Custom-House officers, a bachelor, lodged in the house of a *Förster*, a Government functionary whose duty it was to attend to the woods, and to shoot the game, for which he accounted, and who was a married man.

Now, all this frontier is notoriously infested with smugglers. The forester was in league with them, and he crossed the border and brought over packets of tobacco, which he concealed in the paunches of hares, deer, foxes—any beast that he killed. This went on for a long time, and the Custom-House servant was wholly unconscious of the traffic that went on under his nose.

The forester became so daring and reckless through success that sometimes in the wood he would give up a deer or any other of his booty, well charged with smuggled goods, to the other official, and say, 'Be a good fellow, and carry this home for me. I am after a confounded fox.' And the Customs man with alacrity did as required.

One day the forester handed him a fine fat hare, and made the same request. 'I want to track a wolf,' he said, 'so cannot get home for some hours.' The *Zollbeamter* agreed, and threw the hare over his shoulder and took it home. But on reaching the

cottage he said to the wife, 'See! This is a very plump hare, and Fritz says that we shall have her for our supper. So I will clean the beast for you.'

'On no account!' exclaimed the forester's wife, and laid hold of the hare.

'But I insist,' said the man, grasping the hare by the forepart. She endeavoured to pull it away, and between them dragging, the hare burst, and out fell packages of tobacco.

One more story with which to conclude.

At Marseilles, as in other French towns, all cattle and beasts brought to market are taxed as they pass the barrier of the *octroi*.

A friend of the *douanier* betted him that he would outwit him. 'I defy you to do it,' said the officer. 'I will bet you twenty francs you do not.'

'Done!' said the other.

A day or two after, a girl who lived beyond the barrier rushed up to the *octroi* officer, with tears in her eyes and wringing her hands. 'Oh monsieur! Help! help! My mother has the plague.'

'What do you want, mademoiselle?'

'Oh, help! help! She must be taken at once to the hospital. I have got her in the arm-chair. Help to carry her.'

'I cannot leave the office.'

'Oh, do! Let your assistant keep watch.'

The good-natured man consented. There was alarm in Marseilles. There had been several cases of plague, or suspected plague. So he accompanied the girl. A couple of poles were thrust under the chair, and he walking before, she behind, conveyed the patient, who groaned, grunted, and was closely muffled, along the road, past the *octroi*, into the town, where the officer was met by his friend, who stopped him.

'Ah-ha! *mon ami*. Whither are you going?'

'To the hospital. This is a case of the plague.'

'Indeed!' exclaimed his friend, and snatched off the mufflers. 'Why, you are conveying an old sow through the barriers, and it has not paid tax. Hand me the twenty francs.'

A DREAM OF THE WEST.

In the heart of the West lies an island—
An island of gray mist and gale,
Of lone shore and far-stretching headland,
Of crags which the clouds wreath and veil,

Of dawns whose pale skies have the pearl's light,
Nights of velvet gloom 'broidered in gold;
Days when earth's face is mirrored in water,
Line for line, shade for shade, fold for fold.

A land of lost past and dumb present,
Yet with story for eyes that can read
In the faces and hearts of her people
Blurred pages o'erwritten by need.

For the South, with its pride and its riches,
And its sons with their gilded disdain,
For the land in their eyes but a playground,
For the seas whose bright treasures they drain,

They have frozen the hearts of the people,
They have laid the wild legends of yore;
For how can a man think of sagas
With the whine of the wolf at his door?

So the hills watch alone o'er their secrets,
And the wave laps the rock that has seen,
In the dim light that shines before dawning,
How the shade of a King sought his Queen.

And this is the song that they sang me,
The dark rock and silver-voiced wave,
As I sat by them, silent and mourning
O'er the past of which time marks the grave:

'The mist is gold on the headland,
The purple is deep on the hill;
And the sorrowful cry of a rock-fretted sea
Echoes on, where all else is still.

'But over its fire-touched bosom,
Past shadowy island and shore,
Comes slowly the shape of a fisher's boat,
With a gleam on the dipping oar.

'And the man that is in her is Cuchullin,
The King of the Four-Winged Isle,
Whose hair has the fire of the sunset,
Whose eyes have the foam-crest's smile.

'He is gazing across to the hillside,
Where the shadows lurk misty and dim,
And the sea-fowl that herald the tempest
Circle shrieking, dip downward, and skim.

'What is it that Cuchullin is seeking?
A gray form like mist-wraith or sprite,
With cloak that the wind shakes and flutters,
With hair like the dark wings of night.

'Ay, hark! for he calls full softly,
As the boat glides on to the shore;
Is he heard by the ears that are listening,
As they listened in ages of yore?

'"Ah, Morag, fair Princess of Ireland,
Thou hast left thy dark cairn on the hill;
And the voice that was ever thy waking,
Can it sound in thy sleeping ear still?"

'"Nay, Cuchullin, thou King of the Fire-Hair,
Dost think that those curtains of stone
Round the bed where thy Queen lay in slumber
Could deaden that voice and that tone?

'"Love, but I heard thy voice calling,
In dreams knew thou wast at hand,
Before, over the gray of the morning sea,
There rose to thy sight the land."'

THE COOLIE EMIGRANT.

THE scorching heat of an Indian sun blazes down on Adjudhia's crowded streets, driving the motley throngs to the scant shelter of bazaar or *dharmsala* (travellers' rest).

These are the days of the great bathing-festivals, and the streams of 'damp devout,' having washed away the sins of the past year, and satisfied *pro tem.* the pecuniary demands of the priest, leave the ancient temples huddled together in gray piles on the banks of the sacred Gogra stream for the booths and *tamashas* (native shows), the never-failing concomitants of religious display in India. This is the coolie-recruiter's harvest-time. Will not the generous *Sirkar* (Government) pay him in silver rupees for every son of the soil won by his persuasive tongue for service in the far-off countries? Well Ramjani knows his 'happy hunting-grounds.' He seldom attempts his arguments in the remoter jungle villages; he values his skin too highly for that, for new ideas do not find favour in these communities. Their depth of ignorance has a corresponding depth of suspicious fear, with an unshaken faith in the efficacy of a stout bamboo for leaders of new movements. Yet Ramjani knows well that it is just these men that, once secured, are the best working article. He patiently waits his opportunity to 'speak him fair' when the great event of his yearly visit to sacred city and holy shrine has removed him from the everyday influences of his life, and rendered his mind more expansive. The 'yokel' has much the same characteristics whether his skin be white or black, his native hamlet embosomed on the green slopes of some remote Yorkshire dale or buried in the tangles of an Indian jungle. It needs very little penetration to spot him, and practice has made it a very easy job to our friend the recruiter. Curiosity aroused and suspicion lulled, courage awakes, and Psuldham is seized with the spirit of enterprise (and cupidity). He and Sukee-Thesa (his almond-eyed wife) are tired of the old mother's scoldings. Why should not they and the *batcha* (baby) go and become rich like old Ghosé the fat village *bania* (money-lender)? So he listens to Ramjani's reasonings. The great *raj* has lands across the sea; not the cold, damp country that the *sahib* calls 'Home,' but rich and beautiful lands, with the warm sun of Hindustan, where the soil is so fertile that the plantations yield abundantly to the toil of the labourer, whose earnings are trebled. 'Five days' work out of the seven, at seven hours a day, and a shilling a day, will soon make a man rich.'

Presently Psuldham finds himself standing before the great collector *sahib*, who reads to him in his own village tongue the words which bind him to work five years for the *Sirkar*, who in return will be a father to him, giving him house-room in health, medicine in sickness, and warm clothes for the long journey over the dark water. He is duly enlisted, and now becomes a Government article, to be forwarded with all due care and despatch.

In company with other parties of coolies, under charge of 'forwarding agents,' he starts for Calcutta. 'Dry food' (the native term for anything eatable that does not come under the category of rice-curry or *chapatti*), that may be eaten by any caste, is supplied by the Government to the emigrants, who, after weary days and nights in the train, arrive dazed and travel-worn in Calcutta, which must, indeed, be to them a land of wonders, the 'City of Palaces.' Many have never seen a ship, and are now confronted with the varied and crowded shipping of the Hooghly. Dingies carry the new-comers down the river to their first resting-place, the depôt in Garden Reach.

A dip from the bathing-steps, followed by a good meal and a night's rest, has made new men of the travellers, and they are able to take stock of their surroundings whilst confabulating with the hundreds of other coolies who are waiting till the numbers are complete for the big steamer lying at the end of the jetty.

A two-storied house with wide, shady verandas contains the offices and residence of the English Government emigration agent. The building, which

[*All Rights Reserved.*]

dates from the days of the old merchant princes, stands back from the river, and is approached by a fine old avenue of the crimson *goldmohur*-tree, with glimpses of a wide green lawn dotted with flower-beds, in which, during the three comparatively cool months of the Calcutta winter, English flowers run riot. A path from the main avenue leads to the depôt where the coolies are lodged, sometimes to the number of a thousand at a time, in neat wooden huts: a big family, for whose health and discipline the English manager is responsible to the Government. So six o'clock every morning sees him moving round the grounds, with an eagle eye for work possibly scamped and an ever-ready ear for the new-comer's inquiries and anxieties. A 'history-sheet' is drawn up for each emigrant, and on the same are entered marks of identification, with names of the next-of-kin, to whom, in the event of an emigrant's death, his earnings and possessions are forwarded. A little hospital, with an eye-ward and a hospital assistant, provides for cases of sickness or ophthalmia, which are reported to the health-officer at his next visit. The coolies keep their own grounds in order and help in the weeding and watering of the gardens till eight o'clock brings the breakfast-bell, and the hungry workers sit in orderly rows to enjoy the big helps of curry and rice which are rapidly ladled out by the Brahman cooks from enormous *chatties* mounted on wheels, so that the double lines of empty plates are quickly piled with the savoury mess. A similar meal is served at 5 P.M., and the emigrants make merry with weird music till 'order' is called, and the *chowkidar* (watchman) keeps watch till dawn.

The week before the boat sails is a busy one. The contractor provisions the vessel with the rice and curry stuffs for the eight hundred odd souls during a voyage of nearly three months. Flour, too, must be provided for the *chapatties* (unleavened cakes), which are the staple food of many of the emigrants. Below decks the 'passengers' accommodation' is divided into three sections: married quarters, bachelors, spinsters; a sort of raised platform on either side of the saloons filling the double rôle of beds and tables.

On the day of departure each emigrant begins operations with an early dip in the river, after which the coolies are presented with a new suit of cotton clothing and head-gear differing in hue according to the districts from which they are recruited—a somewhat important matter for the employers of labour, for some men can command a better wage than others, the planters being anxious to secure the hardier and more powerfully built Central Province man. Each coolie has his number embossed on a tin circle suspended round the neck; and the 'ornament' gives unbounded satisfaction to the owner. Some of the grubbier members are presented with a piece of sunlight soap, which oftener than not is tasted before the individual realises that this article is for 'outward application' only. The morning meal finished, the men and women stand in orderly rows near the jetty, waiting for the health-officer's inspection: an anxious time for the Government agent, for a case of fever may be detained till the doctor is satisfied that there is no fear of the dread plague developing; and a delay of this sort, when all the preparations (victualling, &c.) are completed may mean a serious loss to the Government and their contractors.

If all are passed the embarkation commences, the emigrants being sent on board in parties of six at a time. *Place aux dames:* first the spinsters, then the married people with their children, and last the gay bachelors. At the end of the gangway two British tars are stationed, one helping the women and children, whilst the other presents each emigrant with a bright-coloured blanket. New clothes, blankets, &c. put the whole family in excellent good humour; and the scene, as we watch it from the upper deck, where the handsome old Scotch captain dispenses a farewell tea to his friends, is quite a gay one. The coolies, pleased and amused with their novel experience, are decked out in their brightest corals, beads, and ornaments; and the women, one arm holding a baby on the hip and the other a small fan or some particular household treasure, make delightfully picturesque groups. Presently it seems to dawn on one vivacious dame that she is leaving home and country, for with alarming suddenness she gives vent to violent laments and weeping, in which she is ably seconded by other excited ladies. The captain takes it very calmly, and assures us that they, like women all the world over, will be relieved by a good 'weep,' and that a few hours will see them quite resigned and eager for the privilege which the 'captain *sahib*' affords to little parties of women and children to sun themselves peacefully on his deck.

The last scene is the inspection of the lascars (the native crew), and then the bell goes, and we scramble hastily across the gangway, wishing a good voyage and a happy fortune to the outward-bound emigrants.

This has been a field-day to the emigration agent and his officials, who, the secretary tells me, have been hard at work since 6 A.M., with a hastily snatched interval for lunch; and even now, although the red sun is sinking in the Hooghly, they have yet an hour or more of office-work. The secretary, however, is free to dispense hospitality, and gives us many interesting particulars as to the emigration scheme. The post of doctor on board one of these vessels is eagerly sought for; for, besides liberal pay, the doctor receives a capitation fee for each coolie safely landed, and if he is lucky enough to get a return ship, makes quite a neat little sum.

A very fair percentage of the coolies settle down when their five years' contract is concluded, and start little shops on the estates, or even cultivate their own plot of land. A very creditable proportion, too, of their earnings is sent home to India to

the 'old folk.' In spite of his many faults and failings, the native of India very seldom forgets his family obligations. I remember having this fact very forcibly brought home to me in Calcutta. One Saturday evening, while walking through Bhwanipur, one of the poorest native suburbs, I saw the little post-office fairly besieged by double lines of natives with money-orders in their hands, waiting to send a part of the week's earnings to the old homes. All castes and classes were represented. Here a ragged coolie and a sleek *baboo;* farther down the line a very youthful clerk was helping a fine-looking old grandfather, who had evidently forgotten his spectacles, to write out his form.

India's affairs and administration are much criticised by those who know least about them; but the implicit trust with which these thousands of emigrants consign themselves to the white man's care gives ample proof that this department is worked with unremitting zeal and an intelligent understanding of the wants of this working-man section of India's toiling millions.

GIANT CIRCUMSTANCE.

CHAPTER XIV.—WIDENING WAYS.

GEOFF'S leave was running out, and his mind was still on the balance as to his future course.

His own strong inclination was to send in his papers. His friends all advised the opposite.

'It's throwing overboard a good many years of your life and of jolly hard work,' said Exmoor. 'And it isn't as though you had a beastly big estate to look after, you see. What on earth would you do with yourself, old chap?'

It had been on the tip of his tongue to say, 'It's not even as though you were married, you see;' but he bit it off in time. That was a phase of the matter he and Ellen often discussed in private and regretted; but it was no good stirring up bitter memories.

'Oh, I don't know,' Geoff would answer him. 'Travel, I suppose. Go off on a big shoot, maybe—Abyssinia, or some such place.'

'That's all well enough for a time, but'—with a knowing wag of the merry head—'I doubt if it would satisfy you long. You're not built that way.'

Colonel Trevor's advice was much the same; but, in spite of them all, Geoff still felt a strong disinclination to spend the rest of his life bucking up, as he said, against the Colonel Everetts of the British army.

Bethinking himself of his promise to the Grand Duke of Eisenach, he called upon him one day, and found him, as before, up in his laboratory busy among his bottles and test-tubes.

'Ah, Mr Challis, it is good of you to think of the solitary,' was his kindly greeting. 'What have you been doing with yourself? But some of your doings I have heard of.'

'Nothing very detrimental, I hope?' smiled Geoff.

'Very much to the contrary. Grattan Street, for instance.'

'Ah, that! Yes, Grattan Street is rare fun.'

'And a very great deal more than fun. I wonder if you would let me have a finger in the pie also?'

'Ah, now, I believe Trevor has been telling your Highness fairy tales.'

'Would that there were more such fairy tales to be told! You have lit on a good work, and are doing it the right way. What have you decided about the army?'

'I promised to see your Highness before finally deciding. I find it very difficult to reconcile myself to stopping on, and sooner than exchange and allow them the pleasure of thinking they had ousted me, I would quit altogether.'

'In which case the pleasure, such as it is, would still be theirs,' smiled the Grand Duke thoughtfully. 'You have been much on my mind, and I have a suggestion to put before you. What would you say to a military attachéship? The life is pleasant and interesting. You named the diplomatic service. A military attachéship combines something of diplomacy with your own special line, but leaves you practically a free man. In about a year from now the position at Vienna falls vacant. I have learned that Lieutenant-Colonel Basing wishes to retire. It is not, as you know, offered as a rule to any lower grade; but I think it could be managed if you feel like it. Pray don't imagine I am interfering in matters outside my sphere. The matter came up quite casually one night in conversation with—with a person who shall be nameless,' he said, with a smile. 'I thought of you at once, and ventured to suggest your name. And what do you think the Nameless One said, Mr Challis—or, let me see, Mr Carrick, I suppose I ought to say now?'

'I have no idea, your Highness—unless it was something unpleasant.'

'On the contrary. He said, "The very man for it if he'll go." Then, naturally, we fell to talking about you, and I was rejoiced to find that his feelings in the matter were very similar to my own. Some one who was out there had evidently opened his eyes concerning the Tembé affair, and he had some strong words to say about it. What do you say? Perhaps you would like to think it over. You see, at Vienna I could be of some service to you; I know so many people there. They are apt to be somewhat exclusive with strangers at first; but, as I say, that need not trouble you. You speak German, I know.'

'I was two years at Götteburg, your Highness.

To hesitate over such a matter would seem like carping at the bloom on a perfect peach. If the offer were made to me I would accept it with very great pleasure.'

'I believe you would enjoy it. There is work enough, and of a special importance, to keep your mind active; but, except perhaps during the manœuvres, it is not too heavy. The society is, of course, of the very best, and—you are your own man.'

'That last alone is an irresistible temptation. How am I to thank your Highness for this kind thought of me?'

'I will tell you, my boy; though, if you will believe me, this idea was not knowingly present in my mind when the other came to it. You might possibly be of service to us in this way—though, on the other hand, the opportunity may never arise. Our madcap of Gerisau persists in his crazy adventure in Dacia. I have done my best to dissuade him. We have all done our best to dissuade him. But he is *entêté* of the whole matter. There is a glamour in a crown which hides the thorns, and he is young and headstrong. I do not think he will have as pleasant a time as he imagines. A crown at best is burdensome headgear, and this one is too new and crude not to be full of points which only time will blunt. He laughingly quotes Bismarck's playful remark that it will be something to look back upon, and forgets the implication that he will not retain it. If you were at Vienna you would be his near neighbour. In case of need you might render him friendly service.'

'I don't need to assure your Highness that that service should be his to the fullest extent of my powers.'

'I know it, Mr Carrick, and I thank you. He is a fine lad, but hot and headstrong, and with little idea of what he is undertaking.'

'Madcap Hal became Henry V.,' suggested Geoff.

'Truly; but after all he was of the country he ruled. An alien king brings his own thorns to his crown. It might be as well to keep your own counsel in this matter, for the present at all events. Premature advertisement of the appointment might cause ill-feeling in some quarters. One other idea I have thought of for you, and it runs with this one. In view of this prospect, why not take a year at Farnborough?'

'At the staff college, you mean?'

'Exactly. The work is stiff, I believe; but, circumstanced as you happen to be, I can see advantages in it. You could not complete the course, but even the half might prove of service in your later work.'

'I would like it immensely. I cannot thank your Highness enough for all your thought of me.'

'I am thanked already, my boy. And now about Grattan Street. I want to see your work in progress there. When will you take me down?'

'I am entirely at your Highness's service.'

'Have you any engagement for to-night?'

'I am quite free.'

'Then, if you will favour me with your company at dinner at—shall we say 7.30, so as to leave us the evening afterwards? What time do they close up?'

'Oh, not till eleven or so. You see, the idea is to keep them off the streets, and if we turned them out too early we should defeat our object.'

'Then we will say 7.30, Mr Carrick.'

'I trust her Highness is better,' said Geoff as the old man held his hand at leaving.

But the fine white head only shook sadly, and his voice shook too, as he quietly replied, 'There is but one cure for her, I fear, and that is only in God's hands to bestow.' Then he wrung Geoff's hand and went back to his bottles and test-tubes.

It was an odd thing that two matters of such moment in Geoffrey Carrick's life should happen on the same day.

He had an appointment with his bankers, and was strolling along Pall Mall in the direction of the Strand, when he passed an estate agent's window in which were displayed a number of large photographs of houses and estates for sale.

His eye swept over them quite casually. Nothing was farther from his thought at that moment than the purchase of an estate or a house. But the casual glance lighted suddenly on something familiar, and he went quickly to the window for closer investigation.

A placid stretch of sheltered loch. Mighty hills piled in statuesque grandeur beyond it. Below them, on an islet of rock, a gray house peering from a screen of crowding firs: 'The Island, Estate, and Dwelling-house of Innismohr, with all the appurtenances thereof;' and there followed a description of the shootings, fishings, and general inducements to purchase.

And the sense of its remoteness, its quiet aloofness from the stress and strain of life, its holy calm, took hold on him again, as it had done when he viewed it in actuality from the deck of the *Seamew*, and with it all there sprang up in his heart, full-grown and importunate, a sudden irresistible craving for possession.

He walked into the office.

'This place—Innismohr,' indicating the photograph. 'Is it to let or for sale?'

'Only for sale, sir. To wind up an estate. Beautiful property.'

'And the price?'

'Thirty-five thousand pounds. The island is six miles long and about four miles wide. Shooting and fishing are excellent.'

'That is the proprietor's price, I presume?'

'The trustees in bankruptcy, sir.'

'Will you find out for me just what will be accepted for it, and let me know, to this address?' and he went on his way to his bankers'.

It was a considerable sum to invest in a mere whim. In the light of his talk with the Grand Duke, opportunity for humouring the whim might not readily present itself; and yet he felt strangely

drawn to the place. In his query as to the lowest price that would be accepted he simply followed the instincts of a practical man, who knew the value of money, and saw no reason for throwing it away just because he happened to have plenty of it. He knew nothing whatever of the circumstances of the case. Never for a moment did he dream that herein Giant Circumstance, whom some of us delight to dignify by a nobler name, had laid hold upon him once more and was drawing him whither it would, which was the right way. All that he learned in time.

He dined alone with the Grand Duke, waited on by attendants of funereal solemnity; and, but for the quiet cordiality of his host, the monumental silence and depression of the great house would have weighed upon him terribly. For he could not but contrast it with what might have been but for that dreadful day up Nile, when the light of the House went out for ever.

'I rarely dine out,' said his Highness as they rose, 'but I generally spend half-an-hour or so at one or other of the clubs. It is as well not to fossilise completely, even if life is practically over for you. If you don't mind, we will just look in at the Naval and Military. It is on our way.'

So they walked down Piccadilly, Geoff wondering amusedly if the old gentleman had any ulterior motive in his suggestion. Whether that was so or not, the gods favoured the supposition, if not the design; for, as chance would have it, the first person they met as they went in was Colonel Everett coming out. The Grand Duke returned his salute somewhat coldly, as it seemed to Geoff, and made no remark on the meeting. Colonel Everett went thoughtfully on his way.

His Highness had many friends there, and Geoff found several men he knew, and after a cigar and a brief chat with one and another, and a glance at the latest despatches, they went on to Grattan Street.

'After working all day among abstractions I always enjoy an evening stroll through the streets,' said the old man as they paced slowly along. 'They are so very human. High-class, low-class, no class maybe, but all alive and throbbing.'

'Wait till you see my boys, sir, and you'll see life at its springs. Some of them, I'm sure, run quicksilver in their veins instead of ordinary blood. If they kept quite still they would come to grief.'

'To head that young life into right courses is a great work, Mr Carrick, and a mighty privilege.'

And Headquarters fully justified Geoff's saying. It was like a teeming hive; but in it also there was found order of its kind amid all the seeming confusion.

It was Mr Gym's night. The rings, trapezes, and bars were all in full swing. At the far end of the room, half-a-dozen couples in boxing-gloves were vigorously applying the principles in which they had just been receiving instruction, while Colonel Trevor, leaning on his stick, laughed over their zeal and egged them on to greater. In another place Sergeant Connacher had a dozen lively spirits revelling in the click and clash of fencing-sticks. And wherever the eye fell it fell on strenuous, hot faces and shaggy heads and quick-glancing eyes, and white arms below rolled-up, dingy shirt-sleeves.

Trevor came forward and shook hands with the Grand Duke.

'I can't keep away from the place,' he said laughingly. 'I believe some of their superfluous energy gets into one and tends to the renewing of one's youth.'

'I shouldn't be a bit surprised,' said his Highness. 'I have noticed an air of increasing juvenility about you, colonel, and now I've got to the bottom of it. I must try a cure on the same lines.—May I shake your assistants by the hand, Carrick? If I was younger I'd take off my coat and help.'

Sergeant Connacher permitted his troop a rest, which they turned to account in private scrimmages, while the Grand Duke had a chat with him. Sharp ears caught his introduction, and quick whispers flew round that the old cove with the white hair and the stiff back was the Duke of Cambridge, and every boy there swelled suddenly with pride at this endorsement of Headquarters.

Mr Gym performed some of his neatest and most captivating evolutions for the distinguished visitor, and received his eulogiums with becoming modesty.

Then Geoff caught Captain Dicky's twinkle upon him, and beckoned him up, to Dicky's everlasting glory.

'This is the youngster out of whose broken leg the whole idea originated, your Highness,' as Dicky saluted, wide-eyed.

'Good lad!' said the Grand Duke, with a friendly pat on the rumpled head. 'Never was leg broken to better advantage.'

'Why, what's wrong with your lips, Dicky? You've been fighting,' said Carrick.

'No, I—no, sir!' snapped Dicky, and turned a beseeching eye on the sergeant.

Connacher nodded. The small boy saluted, sped into the canteen, and reappeared in a twinkling with a bugle, polished up to lightning-point, but visibly aged and dented. He stood like a statue, placed it to his lips, and sounded a very fair 'assembly,' with swelling cheeks and bulging eyes, and pride incarnate radiating from him.

There was a racket on the stairs as of a load of bricks attempting a record descent; rings, trapezes, boxing-gloves, and basket-hilts were discarded; and the whole available strength of the lion's cubs were panting before the visitors.

'Capital! Capital!' said the Grand Duke.

'That's quite a surprise, sergeant,' said Geoff.

''Twas so intended, sir,' said Connacher, with a gratified salute. 'We bin practising it when you wasn't here. An' that boy's nearly blown his lips off in that room upstairs.'

'He deserves a medal,' said the Grand Duke, and

found a shilling in his pocket and handed it to the jubilant Dicky for lip-salve.

Then his Highness must look into the canteen for a word with Mrs Connacher, which set her beaming like a setting sun.

The shaggy mob was still waiting expectantly when he came out, and he gave them just a word.

'My lads,' he said, 'what I have seen here to-night has made my heart glad. Along this road lies the way to manliness. It is a good thing to be a strong man. It is a still better thing to be a good man. Try hard to be both. Live clean, think clean, talk clean, and may God bless you all! I shall hope to come in again to see you. I shall try to come often.'

They gave him a rousing cheer as he took Geoff's arm and went out, and every boy of them was the better for his visit.

'It is a grand work, my boy,' he said as they paced slowly along Piccadilly. 'If the same could be done in every quarter of the town, and in every town and village throughout the country, your next generation would be a finer one than it is like to be. I am no admirer or advocate of conscription. I know the evils of it too well. Besides, your people would never stand it. But the difference all this will make to those boys' future is incalculable. You are breeding men down there.'

(To be continued.)

COMFORT AND SAFETY IN RAILWAY TRAVEL

A MAN may lie down in a comfortable sleeping-carriage in Edinburgh and awake in London after eight and a half hours, having covered the journey of about four hundred miles with speed, comfort, and economy, and a minimum of bodily fatigue. If he elects to travel by day he may enjoy the luxury of a dining-car, and arrive fresh and fit, having suffered less inconvenience than our ancestors may have done in a journey to the nearest market-town. By a fast train, Manchester is three and a half hours from London, Newcastle five hours, while one North-Eastern train does the eighty-three miles between York and Newcastle in eighty-three minutes. There were 1,086,205,162 passengers conveyed on our railways during 1903, of which 73,990,956 were second-class and 35,069,077 first-class. When we think that there was only one person killed for every fifty millions carried, and one person injured for every million and a half, all that has been said of the safety of our railway system seems true.

The story of our railway development is one of constant increase in comfort, safety, and speed; and doubtless Mr Findlay, late general manager of the London and North-Western Railway, did not exaggerate when he said that railway travelling is the safest mode of progression known to mankind. There is, he says, more danger actually in crossing the street of a large town than in riding in an express train. This grand result has been achieved by the multiplicity of safety appliances: the block telegraph system, interlocking of points and signals, and the appliance of powerful continuous brakes.

Two hundred years ago some of our ancestors believed stage-coaches to be a great evil, making travellers weary and listless, so that they contracted an idle habit of body. They could not always see the advantage of being called early in the morning, of being hurried from place to place, 'stifled with heat and choked with dust in summer, and frozen in winter, . . . to ride all day with strangers, oftentimes sick, ancient, diseased persons, or young children crying; many times poisoned with their nasty scents.' A taste of these 'good old times' in the way of travel would cure most people effectually, when six or seven miles an hour was scarcely possible owing to the condition of the roads. Even a hundred years ago the mail-coach from London to Holyhead took forty-one hours to the journey; after Telford improved the road the time was reduced to twenty-seven hours, or nine and a half miles an hour, with stoppages. The mail-coach between London and Edinburgh went at about the same rate, and took forty-two and a half hours for the journey. The fare was eleven and a half guineas inside, and seven and a half guineas outside; or, with fees to coachman and guards, fourteen pounds and ten pounds. The poor could never travel at these rates! The fastest mail-coaches carried, besides driver and guard, four inside and three outside passengers. The improved stage-coach could convey twenty-two passengers. Thousands lived and died in country places with no knowledge of the world beyond the nearest market-town. Thomas Carlyle wrote from Edinburgh to his mother in Annandale, telling her he was going to London (June 1824) in the Leith smack; and, the wind being favourable, he hoped to be in London *in a week*. In ten or twelve days later she might expect a letter from him. Carlyle in his *Early Letters* gives a pitiful account of a winter coach journey, Moffat to Edinburgh, by Tweedsmuir, a district which looked to him 'the most mournful in Europe because of the dreary coach ride. . . . I never crossed this dismal region without melancholy, bitter recollections.' He describes the tremendous circumference and awe-striking appearance of the guard, shrouded in cloth and leather, and the pitiful, 'woe-worn visages of two fellow-travellers, whose livid noses and rattling teeth proclaimed (we would have thought) that the hour of their dissolution was at hand.' He pictures the guard, at Broughton Inn, like a breathing iceberg, telling of the hardships of the day. Jammed three

in bed as they were, the middle man, a mummy-like Irishman, was heard to exclaim, 'Merciful Heaven, preserve me sowl! What will become of me now?' Christopher North gives the cheerful side of this coach drive by Tweedside in his delightful essay, *Streams*, when that great angler was making for Talla and the head-waters of the Tweed.

A big volume of *Railway Reminiscences* has been written and published by Mr George P. Neele (London: M'Corquodale & Co.), late superintendent of the London and North-Western Railway. In this book of railway notes the development of our railway system may be traced, as well as the rise and progress particularly of the London and North-Western Railway, which has now the enormous paid-up capital of one hundred and twenty-one million pounds. Mr Neele, as becomes a railway superintendent, is a matter-of-fact chronicler of life on the line from year to year. He tells us incidentally, too, of the growth and progress of the other main arteries of railway traffic: the Midland, North-Eastern, Great Western, and branches. Mr Neele began as clerk at Ely Station, and no detail of railway life is foreign to him; while he closes the volume with special notes on the conduct of our late Queen's trains to and from Scotland, with which as superintendent he made one hundred and twelve journeys. When he joined the railway service in 1847, only two third-class trains a day left Paddington; the telegraph was only partial, and was shown in the early *Bradshaw* by means of short ticks, which caused one man to remark, 'Oh, these are the telegraph poles, I suppose.' The route from Glasgow to London was then by Edinburgh, and the frequent changes brought the journey up to fourteen hours. In the absence of telegraphic communication, when passenger trains did not arrive at central stations within twenty minutes of their due time, an engine would be sent out in search of them. The station-master was guided by the sight of steam by day and a headlight at night, the signalling system being yet rudimentary.

The early first-class carriages resembled the bodies of three old stage-coaches placed one behind the other on a frame having four wheels; each compartment held four passengers, and the roof was too low to admit of a person standing upright. The third-class passenger travelled in open carriages, the sides of which were three or three and a half feet high. There was no heating apparatus or light. The railway speed at first was about eight miles an hour, which soon increased to twenty. On the Manchester and Liverpool Railway, opened in 1830, the two classes of trains ran separately. Each vehicle was named 'The Wellington,' 'The Victory,' or some like name, enshrining a survival from coaching days. The first-class coaches held four or six persons inside, according to the fare paid. The second-class carriages were closed and protected from the weather at night; but by the day-trains they were open at the sides, without divisions, linings, or cushions.

In his admirable lecture on railways Mr Findlay says that 'the prevailing idea seemed to be that the only thing required was by any means to transport the passenger from one place to another, without consideration of inconvenience or discomfort, it being probably thought that as he had been accustomed to travel outside the coaches without protection from the weather, nothing more was necessary when he travelled by the train.' The early third-class carriages have been called little better than cattle-trucks, and the second-class have been likened to a shepherd's hut on wheels.

Mr Neele tells us that about 1847 the guards had a rough time. The brakes were worked from the roofs of the carriages; the guards rode outside on an unprotected seat at the end of the vehicle, and applied the brake by turning the hand-screw. Mr Neele once travelled thus outside with his face to the engine, and says that the dust, smoke, steam, and smother which filled his eyes, ears, and nose were sufficient for a first and last experience. The roof-seat gave place to a box-shaped shelter, then to the open van, the one end covered for luggage and parcels. A conductor was responsible for the luggage in a through journey to Scotland. Much of the luggage previous to 1862 was thundered down above the heads of passengers, strapped to the roofs of carriages, and if piled too high, came to grief at the bridges. Our present method of conveying luggage still leaves much to be desired. There is no protection from fraud, and the helpless crowds waiting upon luggage at the vans might be improved upon by the American system or that of the Continental railways.

Before the introduction of the smoking-carriage, Mr Neele remembers the stealthy puffs and whiffs of railway-men in terrible dread of discovery. At Normanton in 1851 a passenger was convicted of smoking in a railway carriage, and of persisting in doing so after being asked to desist. He was fined two pounds and costs for smoking, and five pounds and costs for obstructing the guard, and in default to be committed to the House of Correction for two months. Truly an expensive smoke!

The past thirty years has witnessed quite a revolution in railway travelling in the United Kingdom, and the trains, if less well equipped in many respects than those in the United States, leave little to be desired, at least on the main lines. Sleeping and dining cars (1883–1893), increased speed, more frequent trains, and superior accommodation in every way have been provided. If some vessels are now floating hotels, then the corridor restaurant-train may be called a moving railway hotel, licensed like any other hotel, where third-class as well as first-class passengers may travel on long journeys with a comfort hitherto unknown. For instance, on the Great Northern ten o'clock express from King's Cross to Aberdeen, breakfast is served as soon as the train is started, luncheon at one, tea from half-past three to five, and dinner at half-past six. All corridor cars have movable

tables; a third-class dining-car may seat forty-two passengers, and a first-class twenty. The kitchen, fitted with gas-stoves, is placed between the two dining-cars. Some four hundred and fifty thousand one hundred and twenty luncheons and dinners were provided on the Great Northern last year, and two hundred and eighty thousand teas. Mr Findlay said, 'The railway shareholder finds himself at times occupying the somewhat unprofitable position of a philanthropist whose capital is invested for the advantage of the community at large.' The great modern improvements, he is afraid, have been gained at the expense of the railway shareholder, and represent a greater or less diminution of the profits which Parliament has authorised him to reap from his investments. Railway dividends now yield little more than Consol interest.

The late Duke of Portland had a prejudice against railway travelling, and sat inside his own carriage when being conveyed by train. It is said that our late Queen Victoria needed much persuasion from the Prince Consort at first for this mode of travel. The King, when in Scotland, likes the excellent rolling-stock of the Great North of Scotland Railway when possible. While travelling from London to Sandringham, the King impresses every one as being a thorough British gentleman. He compliments the railway officials on what is praiseworthy, but at the same time may smilingly criticise them if a second late. Mr Neele has had the most extended record of any railway superintendent in charge of the Royal trains, having done one hundred and twelve journeys in all, his first being in 1863 and last in June 1895, from Ballater to Windsor. On this occasion Her Majesty presented Mr Neele with a framed engraving of the Royal Family; another souvenir with suitable inscription came from the Queen later. In 1892 Her Majesty had presented him with a chiming clock, 'in recognition of the care and attention he has given to her comfort and safety when travelling on the London and North-Western Railway for the last thirty-one years.' The Royal journeys are carefully arranged. Appliances for comfort in night travelling, absent in all save the Royal saloon, at first were added on the representation of Dr Jenner. The date of each coming journey was given by the Queen's private secretary, and a draft time-table was drawn up. The carriages selected had to be fitted for day and night travel: those chosen from the depôt at Wolverton were set aside and overhauled. The Queen's own saloon was always carefully kept at an equable temperature. All electric couplings and appliances had to be in perfect order. The locomotive department and district superintendents were advised so as to have the line clear for the train and the pilot engine running fifteen minutes in advance. The engineering department saw that the whole length of the line was watched and patrolled. All shunting across the main lines was stopped for half-an-hour. A lookout man travelled on the engine, in order to look back along the train for any irregularity in running or signal from the passengers. This it was only possible to do for one side at a time. The engine-driver and firemen were thus free to look ahead. The Queen had the utmost privacy, and almost a funereal silence was observed.

All this must have been a great strain on the officials. The stopping-places selected were at parts where there could be little fear of any crowd. Once Mr Neele, in passing along the platform in the dead of night at Wigan, where usually nothing was seen or heard of the Royal travellers, met John Brown, and he inquired of him if all was right. 'No. The Queen says'—but Mr Neele hints this was only John Brown's way of putting it—'the carriage is shaking like the devil.' Mr Neele says that John Brown's coarse phonograph had transmuted Her Majesty's gentle complaint. The train was quite steady. One of the Caledonian engines had a hot axle, and the train pulled up at Forfar. John Brown's remark to Neele was, 'The Queen wants to know what gars this stink:' there had been a pungent smell of hot oil about. The whole of the lavatories in the train were frozen on one occasion. A sergeant-footman asked at the Summit near Beattock if a telegram could possibly be sent to Balmoral. The superintendent was prepared to hear some State secret; instead, Miss —— had only left a pair of black silk stockings behind. The run from Ballater to Carlisle by the North British Railway was once very jerky, and in places the speed was excessive. Mr Neele expected to hear of this, and he did. At Carlisle Colonel Ponsonby handed a note to him by the Queen stating that the unpleasant travelling had made her quite sick, and requesting reduced speed for the rest of the journey rather than such discomfort. The Queen had also once to complain of unsteady driving down Shap incline. The ladies would sometimes complain of insufficient sleeping accommodation, or of a 'deadly smell' in their carriage. Wet moss and pails of ice were suggested at Ballater for the cooling of the roof of the Queen's saloon.

Watts of the London and North-Western was in charge of Mr Bruyères' office when an unaristocratic-looking personage entered and inquired for him. No, he was out. The visitor particularly wanted to see him, and said so. 'Yes,' said Watts, 'many people do; but I know what you want: a job on the line. I may at once tell you, you won't do; you're altogether too short.' The visitor replied, 'Oh! perhaps you will give Mr Bruyères this card, and say I should have liked to see him.' Watts was horrified when he read on the card, 'The Marquis of Chandos,' and wondered how soon his dismissal would be announced.

The American railways have a higher ratio of railway accidents than those of the United Kingdom, which in 1903 amounted to one thousand two hundred and forty-two killed and eighteen thousand five hundred and fifty-seven injured, including passengers, railway servants, and others. The number is small when we consider that over a

billion people travelled. In the years from 1892 to 1902 the American railways killed seventy-one thousand seven hundred and four people, and injured four hundred and thirty-six thousand two hundred and seventy-one. In 1903 about ten thousand people were killed and seventy-eight thousand two hundred and forty-seven were injured. Mr Neele, in his railway notes, has a matter-of-fact account of small and great accidents which took place on the London and North-Western during his term of office, of which the most terrible was that at Abergele to the Irish mail-train in the autumn of 1868, when thirty-three passengers lost their lives. The cause of the disaster was a goods train which was being dealt with at the Llandulas incline too close in advance of the time the Irish mail was due. Four wagons loaded with petroleum had been shunted back, and with the brake-van began to move down a gradient. The goods guard was not in time to jump in and stop the vehicles, which, with scarce any warning, dashed against the oncoming mail-train, crashed into the engine, and 'in a moment spread blazing ruin on the train and suffocating death on doomed travellers.' The engine-driver had leapt from the foot-plate at the moment of the impact. The Marquis of Hamilton, who was a passenger, described what he saw when he alighted. The whole of the three front passenger-carriages, the vans, and the engine were enveloped in sheets of flame, and dense smoke was rising and spreading in every direction. The wreck appeared to have been the work of an instant. There was no movement of any sort or any apparent struggle to escape from the doomed carriages. It is believed that the passengers were at once suffocated by the black and fetid smoke from the petroleum. The charred remains of the thirty-three passengers were all laid together in Abergele churchyard.

A tourist train was wrecked at Wigan on 1st August 1873. The two engines and the first fifteen carriages of the twenty-five which composed the train passed safely through the station; but the sixteenth carriage, in which Lady Florence Leveson Gower was riding, broke away, turned to the left, and the whole eight vehicles became a wreck. It was found to be impossible to locate the cause of the accident, although the London and North-Western afterwards became the pioneers in adopting facing-point locks. Mr Neele was prevented from attending the Forth Bridge opening ceremony by an accident at Carlisle Station on 4th March 1890. The driver of the 8 P.M. express from Euston had lost control of the train after Shap Summit. With its thirteen vehicles it ran through Carlisle Station at thirty miles an hour, struck a Caledonian engine, and drove it a quarter of a mile onward. Four passengers were killed by the telescoping of carriages, and eleven injured. An entire train ran off the line at Melton Mowbray on 25th July 1892, and went over an embankment. The engine, tender, and eight carriages first turned to the inside of the curve, then swerved to the left, and, tearing up fifty yards of permanent way, ran over the twenty-one feet high embankment and became a wreck. The driver, fireman, and one passenger were killed. A return excursion train from Blackpool to Stockport, of three carriages and a brake-van, drawn by a six-wheeled engine with continuous brakes, was running beyond regulation speed towards a sharp curve at Poulton. The train seems to have actually leaped off the rails. Forty yards from the point where it left the Blackpool line the engine turned over on its left side; the tender lay with its wheels uppermost; the three carriages were wrecked and lay across the Fleetwood line. The driver and two passengers were killed, and forty-two passengers were injured. Not every accident turns out as did that in the case of old Spinks of Willesden, who was always meeting with some mishap. An engine had knocked him down, and on leaving the hospital he walked all to one side, unable to go erect. He resumed work in this condition, and was again knocked down. This time the blow removed the internal twist he had before, and he became as upright as ever.

The London and North-Western Railway has ever been the pioneer of all that makes for the safety and comfort of passengers, and probably Mr Neele is correct when he says that the 'West Coast Joint Stock will bear comparison with any rolling-stock in the world, in its steady running and its comfortable appliances for day and night travelling.' This railway has, we observe, been awarded the 'Grand Prize' at the St Louis Exhibition, the highest possible distinction that could be given.

Partly through local tramway competition, there has been great progress lately in the electrification of short-distance railways. Last year the North-Eastern executed thirty-seven miles in the neighbourhood of Newcastle, and the Lancashire and Yorkshire the twenty miles between Liverpool and Southport. In both cases the third-rail system of conveying current to motors was adopted, and also in both cases with a large increase to the passenger revenue. Several millions are being spent on the electrification of the Metropolitan and District Railways, which form part of a system over a hundred miles in length. These are administered as a single concern by the Underground Electric Railways Company, of which Mr C. T. Yerkes is chairman, and Mr James Young (formerly of Glasgow Corporation Tramways) is the general manager. The Yerkes system includes three new 'tubes,' which will give congested London fifty-two new stations. The sections already working have given great satisfaction to the travelling public. The carriages are brilliantly lit, and there is a better service. The railways operating in London, underground and surface, carry six hundred millions of passengers a year, and the new connections in course of construction, it is expected, will more than double these figures. The number of journeys per head of population has increased in a generation

in London from twenty-three to two hundred journeys, and in New York from forty-seven to four hundred journeys.

Steam motors are to be tried on the Great Central, while the London, Brighton, and South Coast has decided to electrify a short section. This does not mean that electricity will either pay or be possible for long-distance travel; but it is an effort in self-defence by the railway companies to secure and conserve local traffic by swifter and more frequent service. As yet no railway company in Scotland has made the venture. The Glasgow District Subway is driven by seven miles of cable, and has a powerful competitor in the swift and well-equipped electric-cars overhead. New York Central and Hudson River Railroad Company is carrying out the electrification of all its suburban New York lines.

We notice that Professor C. B. Dudley, who has lived for about thirty years past in railway cars in the United States, has devised a method for automatically recording the state of the track as the train passes over it. The ventilation is better in American cars than with us. Dudley's method of ventilation is to take in fresh air by two hoods at opposite corners of the cars, which are fitted to exclude dust and cinders. The air goes down below the floor by channels into long boxes extending along each side of it. The Pennsylvania and Baltimore and Ohio Railways are fitting this ventilating-machine to some of their cars. The Americans think that, with all our progress, we are still in the stage of little, cramped compartments, so constructed that each occupant is close to draughty doors and windows, and that our ventilation mainly consists of the crude and dangerous sort of the open window. Many branch-line trains are like this, and worse. The main-line trains, owing to competition, are excellent. Still, we have something to learn in methods of luggage-carrying, heating, and ventilation, as well as in connection with railway bookstalls and refreshment-rooms.

DORNAY'S REVENGE.

CHAPTER II.

IT will be enough to state that Dornay, under a fictitious name (for there was a British Resident at Sarunjah), entered the Rajah of Chuttenpoor's service with the appointment of drill-instructor to his troops. As time went on he rose higher and higher in his master's favour, till he became one of his most trusted advisers in various matters of State policy.

When he felt his position an assured one he took to himself a native wife, who happened to be a niece of Ram Das, the Rajah's soothsayer and astrologer, an influential personage, and gradually adapted himself to the native customs and mode of life, till he became almost as one of themselves. And so years to the number of thirty fleeted by, and but for one dark memory Dornay would almost have forgotten that he was an Englishman. Then, in the space of a few months, he lost both his wife and his friend the Rajah. Whereupon he said to himself, 'It is time for me to gird up my loins and set about the task to which I am vowed, and to which, perchance, I should have addressed myself long ago. But that my enemy still lives I feel assured. I will arrange my affairs and go.'

His determination to be avenged on Udale had in no wise slackened with the efflux of time. He had cherished and nursed it in secret all these years. The fire had smouldered, but it had never gone out.

It is possible that after so long a time Dornay would scarcely have been stirred to action had he not been impelled thereto by a recollection which pricked him far more keenly than the flight of his wife had done, which, after so long a time, seemed like an incident connected with some prior stage of existence. But not so his flogging in the barrack-yard, which he primarily owed to Udale, or so he argued. So cruelly had the lash bitten into his flesh that he would feel the sting of it till his dying day. He had seen common soldiers take their flogging, and after a few days return to duty as if nothing were the matter. But he, Will Dornay, was not a common soldier, he proudly told himself. In his veins flowed the blood of the D'Aurignys.

He sought his friend Ram Das, and imparted to him the news of his approaching departure. 'But I shall come back to Sarunjah and my two sons,' he said, 'when the errand which calls me away has been accomplished. For my native country seems to me now as little more than a dream-land, and there is no one left alive in it for whom I care.' Thereupon he proceeded to enlighten the other about certain particulars of his personal history which he had never confided to any one.

'But how dost thou know that the man still lives?' queried Ram Das presently.

'Had death overtaken him the Inner Voice would have revealed it to me.'

Ram Das nodded gravely. He too believed in an Inner Voice.

'Thou hast already settled in thy mind the particular shape thy vengeance will take when thou hast arrived in thy native country?' he asked.

Dornay's face fell. 'That is the one thing which is not clear to me,' he said; 'but that light will come to me after a time I do not doubt. It must! It must! I have not lived all these years to be balked of my revenge at the last moment. The

gods are just, and will not allow wrongs like mine to go unpunished.'

For several minutes Ram Das sat without speaking. Then he said, 'Come to me to-night when the stars are out, and I will then reveal to thee a way by which, peradventure, thou mayest be able to accomplish the errand which is about to take thee so far away.'

A month later Dornay set out on his journey to England.

In the course of the day following that which he had spent at Marslade, Dornay alighted from the train at Claybrook Station, named after the adjacent village, which was little more than a mile from Warren Croft, the seat of Sir Gerald Udale.

Dornay engaged a couple of rooms *en suite* at the Red Lion Hotel, a noted rendezvous for brethren of the angle, drawn there by the reputation of a certain river in the immediate neighbourhood. A guide-book had told Dornay this, and he had come prepared with a supply of fishing-tackle, as though he were merely an ordinary piscator bent on a country holiday.

Next morning he thrashed the river with no very encouraging result; but that mattered nothing; he was merely acting a part. After his two o'clock dinner he lighted a pipe and strolled out in order to reconnoitre.

He was not long in discovering that the Croft, together with its more private grounds, was surrounded on three sides by a well-timbered park of considerable size, through the lower end of which there was a public right-of-way. A wall about five feet in height divided the grounds from the park, the entrance to the former from the high-road being in charge of a lodge-keeper. In the dusk of evening he again strolled as far as the park and threaded his way through the trees till he reached the boundary-wall, peering over which, he found himself opposite what he judged to be the main front of the house, and the question with him now was in which one of its many rooms Sir Gerald slept. Having scaled the boundary-wall, he stealthily drew near the house. Night had now fallen, and he had little fear of being discovered; so he seated himself on the turf in the deeper shade of a clump of evergreens. In the course of his long sojourn in India he had acquired much of that quality of passivity which is such a marked characteristic of the peoples of the East. He could sit cross-legged for hours, waiting, not merely without betraying any impatience, but without feeling any. How long Dornay had waited he did not know, when suddenly a light appeared in a room the bow-window of which opened upon a balcony immediately over the main entrance to the Croft. Presently the figure of a man appeared at the window, and for some seconds stood staring out into the darkness, as if he might be studying the stars; then he lowered the venetians, and ten minutes later the light was extinguished.

Through the powerful binocular he had brought with him, Dornay was enabled to make out that the lower sash of the window had been left open to the extent of three or four inches, doubtless by reason of the oppressiveness of the weather. He argued, not unreasonably, that the room with the balcony was probably the one in which Sir Gerald slept, and that it was the baronet in person whom he had seen at the window. He went back to his hotel well satisfied with his evening's reconnaissance. One thing alone puzzled him: in what way would it be possible to obtain access to the balcony?

Next evening he again made his way to the boundary-wall, this time to a point from which, sheltered by a clump of elder-trees, he could overlook the grounds, himself unseen. Then it was that he became aware of something unnoticed by him the day before. Painters had been at work on the front of the house, and a couple of ladders were lying on the gravelled walk under the windows. The question which had puzzled Dornay yesterday was answered. Here were the means ready to his hand for obtaining access to the balcony.

Presently two persons emerged from the house and began to pace the terrace from end to end—an elderly man and a girl of six or seven. At once Dornay brought his binocular into requisition. His hands were trembling, and he was conscious that his heart was beating faster than ordinary. He steadied the glass and took a long look through it. Yes, there could be no doubt that he saw before him the man whom he had come six thousand miles to find. At once he recognised him, despite the changes which the years had wrought in his appearance. For a few moments Dornay's eyes became blurred, and everything seemed to dance before him. With a deep breath he pulled himself together. 'He has been delivered into my hands,' he said; 'the day so long delayed has dawned at last!'

The girl walking by the baronet's side had no interest for him. He just noticed that she was very pretty, and then he shut up his glass and turned to go. If he had ever been tempted to refrain from his fell design, the sight of Sir Gerald Udale would have served to clinch his determination to carry it out to the bitter end after the fashion arranged between Ram Das and himself.

An hour later the storm which had been threatening for some time broke, and that night nothing could be done; but the rain had ceased before daybreak, although the sky remained dull and overcast.

Next afternoon Dornay purposely omitted to feed his flies; but what he did was to transfer one of them to a specially prepared box about half the size of the other. Then, in the dusk of the August evening, he took his way to the park, and as soon as it was dark enough he scaled the boundary-wall, and this time bent his steps towards a garden-seat under the branches of a spreading cedar which he had noticed the day before. There he waited, as he had waited two nights earlier.

Hardly had the turret-clock chimed the half-hour past ten before a light appeared in the balcony

room. Again Sir Gerald stood looking out for a little space before letting down the blinds, and again the light was extinguished a few minutes later. As on the previous occasion, the sash was left a few inches open at the bottom.

For upwards of an hour Dornay waited without stirring; then he rose and took his way towards the house. It was a hot, windless night, partially overcast, but with a few stars dimly shining. Everywhere reigned silence the most profound; the world seemed sunk in a dreamless sleep.

Dornay made straight for the ladders seen by him the day before, where they lay along the terrace. After he had found them, it was a comparatively easy matter to raise the shorter of the two and place it in position against the balcony. Then, after a precautionary look round, he began to climb the ladder slowly and carefully. Two minutes later he was on his knees in the balcony, listening for any sound which might reach him from the room; but the death-like silence remained unbroken. Then he put forth his right hand holding the box he had brought with him, and inserting it through the opening left by the unclosed sash, he pressed the spring which caused the lid to open, and held it there for the space of several seconds, never doubting that the insect shut up in it would on the instant make its escape.

Dornay had replaced the ladder where he had found it, and had left the house some distance behind, when the turret-clock struck twelve. He felt like a man to whom the accomplishment of his life's purpose brings not merely the consciousness of a great task achieved and supreme inward satisfaction, but, following thereupon, a strange sense of vacuity, as though existence had now lost something which heretofore had been its chief concern, and that there would not be much left worth living for in time to come. Still, it was with a feeling of grim elation upon him that Dornay made his way back to his hotel. 'Twenty-four hours at the outside was what Ram Das impressed upon me,' he murmured more than once as he strode through the darkness.

It was Ram Das who had originated the terrible scheme of vengeance which Dornay had put into execution that night. To the latter the Hindu had given the two 'death-flies,' as he termed them, with full instructions how to utilise their deadly qualities. The species of fly in question was reputed to be indigenous to the jungles round about Sarunjah, and in its natural state its bite, although malignant, was rarely fatal; but by confining it, and feeding it for a time solely on flesh impregnated with the juices of certain poisonous plants, one prick of its proboscis was rendered virulent enough to cause the death of the strongest man.

But in order to ensure immunity for any one having to do with such deadly insects, it is essential that he should be inoculated with the virus, and that was the process undergone by Dornay before he left Sarunjah.

When Dornay reached the 'Red Lion,' instead of every one being abed save the 'boots,' he found that two strangers had arrived by the last train, and had not yet finished supper. At once he took his bed-candle and went up to his room, which was on the first floor. There, after stripping off his coat and vest, he flung wide the window and blew out the candle. He was in no humour for bed. 'In twenty-four hours at the most:' the words kept ringing in his brain with persistent iteration.

(To be continued.)

SOME PHENOMENA OF SNOW AND SAND DRIFT.

By W. J. MILLAR.

OUR main roads and railway-tracks are subject during the winter months to interruption of traffic due to heavy falls of snow, which, combined with high winds, causes drifts reaching frequently in hollow parts to many feet in depth. This leads not only to detention of traffic and great loss and inconvenience to passengers on the main lines of road or railway, but also to those living in country districts, depending, as they do, for frequent supplies of necessaries from business centres.

To remove these accumulations of snow from our roads or railway-tracks snow-ploughs are employed, which, being driven forward, press the drifted snow apart. The same purpose is also sometimes effected by rotary blades which, affixed to machinery, work into the snow and throw it sideways off the track.

In some countries where sandy wastes are common, the continuity of traffic is also sometimes threatened by sand-drifts. The sand, like the snow, is urged forward by high winds, and in hollow places tends to accumulate.

Protection from these accumulations, whether of drift snow or sand, being a necessity, much attention has been devoted to the subject by engineers in charge of railway-tracks and roadways. The subject offers an interesting field both for observation of the natural forces at work and for experimental devices for remedying the evil.

The first and most natural device to suggest itself for the counteracting of the drifting action is to erect some kind of protecting screen on the windward side of the hollow or cutting through which a line of transit passes. This serves very well for a time; but if the storm is lengthy the accumulations will increase so as to eventually pass over the top of the screen.

Hedges have been used where drift-sand causes

trouble, and for a time serve by their resistance to check the onward movement. This restraining action on sand-drift is well seen in the efficacy of sand-loving plants, such as our bent-grass, the roots forming an anchorage to the lower sand-particles, whilst the long grassy stems act as retarders to the surface movement.

An effective and ingenious screen has been devised and used for the prevention of both snow and sand drifts, in which, instead of blocking the course of the moving particles, whether of snow or sand, the free movement of these particles themselves is made to effect the clearance.

In this case on the windward side of cuttings screens are placed, consisting of stout posts driven into the slope of the bank above the roadway, and these posts are connected together on their tops by a roofing of boarding having a slope pointing downwards towards the rail-track.

The snow or sand laden wind, as it sweeps over the track, meets this obstacle and is deflected downwards by the inner surface of the roof, and passes out through the lower opening with sufficient energy to carry the particles right across to the leeward side of the track. This simple expedient is a good example of humouring nature, so to speak; the energy of the blast being controlled and guided to carry forward the particles which would, if retarded in their passage over the hollow, drop into it and accumulate there.

Drift-sand in many parts of the world offers a serious menace to occupation and cultivation of the ground. In our own country a striking example of this destructive action exists near Forres, where the Culbin sands, near Findhorn, cover an area of several thousand acres. About two hundred and fifty years ago the land appears to have been under cultivation; but by degrees the sand encroached, and in the form of moving hills gradually obliterated all trace of man's occupancy. The movement is towards the east, due to the prevailing westerly winds. The sandhills rise to about one hundred feet, and have longish slopes on the windward face, with an abrupt descent to the east. The process of movement seems to arise from the wind driving the particles of sand, which in such situations are finely rounded, up the sloping face, when, passing over the crest, they drop or roll down the steep eastern face.

The planting of trees, bushes, and sand-loving plants as retarders to sand-movement is of great effect wherever the climate has sufficient moisture to support such vegetation. Thus, in the district of the Landes, on the south-western coast-line of France, there are large areas near the sea wholly covered with sandhills. To check the sand-drift, forests of sea-pines were planted, and these have flourished so well that not only is the drifting checked, but the timber is a marketable commodity.

In India there are extensive areas in the north-western districts covered with sand, which in some cases assumes the form of ridges from fifty to one hundred and fifty feet in height, and at certain seasons high winds cause waves of sand reaching over twenty feet in height to move across the country. These sand-storms darken the air and cause great trouble to the railways in the district. The difficulty is largely met by adopting devices along the track as already described. The moving ridges or hills of sand appear to be enlarged examples of the sand-ripples raised by the wind where loose, dry sand has gathered, as on the higher parts of sandy shores, corresponding to some extent with the furrows noticeable on the water-covered or tidal portion of the beach—'the ribbed sea-sand' of Coleridge's *Ancient Mariner;* their contour also showing the flatter and steeper slopes as in the larger examples inland.

PRESENCE OF MIND.

By Reginald A. Gatty, LL.B.

HERE is a distinction to be drawn between presence of mind and courage. People who are naturally timid and nervous will, under circumstances of great danger and excitement, perform acts of heroism which would be beyond their powers on ordinary occasions. We speak of these as instances of persons showing presence of mind; but if you asked them they would tell you that an involuntary impulse, rather than any premeditated course of action, guided their will on the occasion. Had they had time for reflection, when all the threatening danger to themselves had become clear to their minds, their natural timidity of character would have asserted itself, and deprived them of action.

On the other hand, courage may be defined as the absence of fear and all thought for self-preservation, and its possessor is not dependent upon any momentary impulse to call it into being. His mind is disciplined and under control, and he is unmoved before the peril which confronts him. There is no braver body of men than the London police, and any one who has witnessed one of these guardians of the street traffic step forward and seize a runaway horse in the crowded thoroughfare cannot have failed to admire his courageous act. This is more than presence of mind; it is bravery of the noblest and best kind. It was no sudden thought or inspiration which came into that policeman's mind. Long before the horse reached him he saw it coming, and he knew he ran a risk of his life when he rushed to the rescue.

It is the same absence of fear which prompts the

soldier, under a heavy fire from the enemy's guns, to go to the assistance of a wounded comrade and bring him to a place of safety; and nothing in human nature can compare with such self-sacrifice. But in times of sudden emergency it is not always the bravest who act with promptitude, and the following story is an instance of this.

Towards the close of the Crimean war a troop-ship was returning to England with invalided men, and one morning at sea a group of officers on the deck discussed the subject of firing shells. A soldier was told by Colonel B. to bring an empty shell with a fuse. The colonel took the shell in his hands, and striking a match, lighted the fuse. As this slowly burned, and the colonel proceeded with his address to the other officers, another soldier passed the group, and the moment he caught sight of the shell he rushed forward, exclaiming, 'Take care, sir; the shell is a live one.' He then did what never seemed to come into the minds of any in the group of officers: he seized the shell out of the hands of the colonel and threw it into the sea. For this service he was made a sergeant, and on coming home he had the honour of receiving a small present from the hands of the Queen, to whom he was presented. The soldier who had been told to bring an empty shell had gone to the wrong magazine. I many times talked over this incident with the sergeant, and he repudiated any idea of having done a brave action. 'I don't know,' he said, 'what made me seize the shell out of the colonel's hand; but it came suddenly into my mind, and I did it.' It is this coming suddenly into the mind, this wave of unconscious thought, which constitutes true presence of mind. This will come to people of nervous and even cowardly natures.

I remember an instance when a man whom I knew to be utterly deficient of courage saved himself from a very awkward situation. He lived in a town in the Midlands, where he was an organist. Late one evening he was returning home through some of the back streets, which at that hour were more or less empty of people. As he went along, however, he noticed, some distance ahead of him, a man and a woman walking side by side, the man's arm being round the woman's neck. Just under a gas-lamp the couple stopped for a moment, when he heard a piercing scream and saw the woman slowly falling from the man's arms. Almost before she had reached the ground, the man darted away down a side street and disappeared. When the organist came up to the woman he found, to his horror, that she was lying in a pool of blood. His first impulse was to run away and get clear of the terrible scene; but his better feelings prevailed, and he knelt down beside the poor woman to see if he could do anything for her. When he raised her head he found she was quite dead, with her throat cut from ear to ear. Beside her on the pavement lay a blood-stained razor.

The organist was overwhelmed with the horror of the scene. Before he could collect himself a group of people had gathered, as they invariably do when anything happens in the street, and presently he heard expressions such as 'He did it;' 'I tell you I saw him;' 'Why, here is the razor he cut her throat with;' 'Oh, the cruel brute! Seize him,' &c. It was certainly a very awkward position, as the rough character of the people might tempt them to take the law into their own hands and use him very badly. The arrival of a policeman seemed to steady his nerves for a moment, and then came a wave of inspiration which may almost be termed presence of mind. He seized the dead woman's wrist, and pulling out his watch, he pretended to go through the form of feeling her pulse. Then he put his hand over her heart, and turning to the policeman, he said as calmly as he could, 'I am sorry to say I can be of no further service here. The poor thing is quite dead; there is no action in the heart or pulse.' In an instant the murmurs of the crowd changed, and he heard 'He's the doctor' on all sides. This was his opportunity, and slowly rising, and affecting to be in no hurry, he passed through the crowd, who made way for him and offered no obstruction. But he told me that when he got clear of the street, and came to the first turning, he took to his heels and ran for all he was worth. The cowardly spirit got the better of him in the end. He heard next day that the murderer had gone straight to the police station and given himself up.

From personal experience I know what it is to feel an uncontrollable desire to act in a moment of emergency, and all people at such times are liable to be similarly influenced unless panic seizes them. If what you do on the spur of the moment saves the situation you are credited with presence of mind; but this is no testimony to your being a man of courage. Anyhow, I personally make no such claim in giving the following facts.

It was during the war of 1870 between France and Germany, and the town of Metz was closely invested by the Germans. I was helping Dr Humphrey Sandwith, C.B., to take stores and various requirements, such as clothing, medicine, &c., to the field-hospitals of the investing German forces. We had both of us been sworn-in as members of the German ambulance by Prince Hohenlohe at Saarbrück, and a railway van was procured for us to take our stores as far as the line would carry us towards Metz, which meant to the point where the French had destroyed it. This was the small village of Courcelles, not far from Metz. Our journey from Saarbrück, which should have been quite a short one, lasted nearly two days from endless shuntings to let troop-trains pass, and other causes, for the line had to be guarded all the way, as the trains were shot at.

I remember it was late in the afternoon when we got to Courcelles, and our first difficulty was to find a cart and driver to take us to a village called Avancy, where General Manteufel had his head-quarters. At last we engaged a rascally-looking

French peasant in a blue blouse, whose cart, he assured us, would hold our stores. There was no seat in the vehicle but the driver's, so we contented ourselves by squatting on two casks, one of brandy and the other claret, which we had provided for the sick and wounded. I must mention that, in addition to the goods we carried, Dr Sandwith had a large sum of money, about one thousand pounds, which had been sent to him from the sick and wounded fund in London, and this he carried in a leather belt round his waist. I pointed out to him the danger we should probably get into during our expedition, and with much difficulty I got him to consent to my carrying a revolver.

As members of the Red Cross and non-combatants, we were not supposed to be armed; but I was very glad afterwards I had my way. A map of the district showed us that our route to Avancy lay straight out of the village of Courcelles, up a long hill, and then we turned to the right. I got this clearly into my head before we started, for the sun was beginning to set, and I knew we had some miles to go. I spoke no French, and could not converse with the driver; but Dr Sandwith made several attempts and could make little or nothing of him. The horses slowly toiled up the hill, and on reaching the summit we entered what appeared to be an extensive fir-wood.

The road was now downhill, and the driver whipped up his horses, and away we went at a very good pace. It was almost dark under the trees, and I fancied every now and again I caught sight of glimmering lights. An opening in the wood confirmed this, and we could distinctly see a few miles away in the valley below us the gas-lights of a town. Now, I knew from the map that the only town marked in this direction was Metz itself, so I asked Dr Sandwith to speak to the driver and ask him where we were going.

It so happened that my friend and I were not of the same opinion regarding the war, and his sympathies were very much more French than German. In reply to my request he pointed out my one-sided views, since I could not trust the honour of a simple French peasant. However, I got him at last to speak to the driver, who made no reply, but whipped up the horses, which went the faster. I felt quite certain the man was taking us into the French lines, and any moment we might be challenged by their outposts. Then a sudden thought came to me, and seizing the driver by the scruff of his neck and pulling out my unloaded revolver, I pushed the barrel into his ear and clicked the hammer up and down. Dr Sandwith protested against my violent treatment of, as he believed, an honest Frenchman; but I refused to relax my grip till the horses were stopped and the cart turned round, and we began again our journey up the hill through the wood. We were in truth perilously near the French lines. In proof of the justice of my fears, I may say that we had barely reached the top of the hill again when a cavalry patrol surrounded us, and we were made prisoners, happily by the Germans. We had to explain how it was we were found coming from the direction of Metz, and when our story was told and our mission to the hospitals explained, we had a profusion of thanks; but the driver got some violent abuse, which I think terrified him. We were then shown the proper road to Avancy, and in due time arrived at General Manteufel's headquarters.

It is certainly the case that men have no monopoly as regards presence of mind. In fact, I think, on the whole, the mind of a woman acts quicker at a time of emergency, though she is perhaps more liable to panic.

The railway accident at Hexthorpe, near Doncaster, was a terrible disaster. There was a mistake over the signals, and one train ran into another which was standing while tickets were being examined. Doncaster races were going on, and both trains were packed with passengers. In one carriage a friend of mine, a medical man, was travelling, and the shock of the collision threw him violently from his seat; but he escaped further injury. Thankful for this, he at once proceeded to the help of others, and he found an awful state of things in the front part of the train. He was the only doctor present to aid the crushed and wounded victims who were being extricated from the telescoped carriages. He began binding up the fractured limbs as best he could; but he had no proper appliances, when an old countrywoman approached him, and without saying a word she emptied the contents of her apron beside him, consisting of neat rolls of torn window-blinds, for bandages. At such a moment nothing could be more useful and opportune. But it was a remarkable instance of presence of mind on her part, and very different from the conduct of one lady who went rushing about this scene of carnage calling for the guard to find her parasol which she had lost. People, however, are not always responsible at such times for what they do.

Panic is the exact antithesis to presence of mind; but the worst thing about it is its terribly infectious character. When once it seizes upon a crowd of people it seems to deprive every one of his reason, and it destroys all the higher feelings of humanity. Panic in a theatre, when the cry of fire has been raised, will make men and women trample each other down, regardless of everything but their own safety. Nothing can be imagined more awful than a scene of this description, and at the same time more utterly wanton; for in nearly all cases a little presence of mind might save hundreds of lives.

But it is not only human beings who are affected by panic. Animals suffer in a similar way, as is well known to those who keep herds of cattle or horses. Nor are the bravest men always free from its contagion. The saddest military disasters are those befalling regiments struck with this fatal malady. What demoniacal brain-wave is it that conquers the reason both of man and beast? Let no one think he is immune from the infection of panic, and blame those who have fallen uncon-

sciously under its spell. It cannot be denied that both panic and presence of mind are due to uncontrolled suggestion, and are quite unpremeditated. The one turns a brave man into a coward, and the other a coward into a brave man, or at any rate into a man who involuntarily does a courageous action. In these days when everything in the unknown universe seems due to wave-action, such as waves of light, waves of sound, &c., there is nothing very unreasonable in the idea of waves of thought passing from man to man in unseen movement. How often it happens that two people separated from each other by a long distance, and after years of silence, will suddenly write, and the letters cross in the post, showing they were thinking about each other at the same time!

That one mind acts upon another in some mysterious way is constantly proved to us; and as a case in point I will give a story as it was told me by the late Mr Charles Kean, the well-known actor. Mr Kean and his company, from the Princess's Theatre, were acting on tour in Dublin, and he accepted an invitation to spend a Saturday to Monday interval at the country house of his friend Sir A. As Mr Kean had a good deal of business on hand, he took with him his papers and correspondence, intending to get through some work during the visit. His friend lived in an old-fashioned mansion, beautifully situated, but in a very lonely part of the country. The household consisted of Sir A., his wife, and his aged mother, who, being an invalid and unable to walk upstairs, occupied two rooms at the far end of the entrance-hall. The apartment adjoining these rooms was the library, but the other habitable rooms were some distance away. Mr Kean noted these facts when he was taken by Sir A. to see the old lady, and he casually remarked to his host that she was rather cut off from the rest of the house in case of a fire or burglary. 'It is her particular wish to be where she is,' replied Sir A.; 'but I have taken the precaution to have strong bars put upon the windows, and she locks her door every night when her maid leaves her. The fact is, I want some one to be with her at night; but I cannot persuade her, and she also insists on keeping some very valuable family diamonds in her room, and refuses to let me put them in a proper safe.'

One thing during dinner struck Mr Kean, and gave him for a moment an uneasy feeling. He noticed that the butler, who had a crafty, disagreeable face, was constantly watching him, and he was glad when the servants withdrew and he was alone with his host. When the evening was over, Mr Kean explained to Sir A. that he had some important work to do, and said he would like to retire to the library instead of going to bed. It was three o'clock in the morning before he had finished writing, and then, lighting his bedroom candle and extinguishing the lamp, he gently opened the library door, and found himself face to face with the butler, who was standing outside Sir A.'s mother's room. The man was in his shirt-sleeves, with a box of what seemed to be tools under his arm and a dark-lantern in his hand. The impression which the man's evil countenance had made upon Mr Kean was redoubled when he saw him in such a suspicious position. Quickly realising that he ought not to be there, Mr Kean asked the man what he was doing out of bed at that time of night, and the explanation he gave was that his master had ordered a lock to be repaired, and he had forgotten to do it; but on waking in the night he remembered, and came down for that purpose. Mr Kean sharply told him to go off to his bedroom; and to emphasise this he ordered him to go before him up the stairs. The man sullenly obeyed, and Mr Kean went to his room.

It was an invariable custom with Sir A. to pay his mother a visit before he came in to breakfast, and the next morning it was later than usual when he joined Mr Kean. Whether the butler was afraid something might be said about the night's adventure or not, he certainly appeared in no hurry to leave the room, and he probably would have remained had not Sir A. summarily dismissed him.

Then Sir A. told the following story: 'I went to see my mother this morning, as I always do, and I was shocked to find her in a state of nervous prostration. She told me it was all owing to a terrible dream she had the previous night. She said she fancied she heard some one picking the lock of her door and opening it; and looking up, she saw the figure of the butler, in his shirt-sleeves, approaching her with a box of tools under his arm and a dark-lantern in his hand. He put the tools down, and taking up a knife, he came and stood over her bed. She closed her eyes so as to pretend to be asleep, and then the man flashed the light of his lantern over her eyes to see if she were awake or really sleeping. The strain and effort were too much for her, and she started up and found herself screaming.'

Mr Kean then told his story, and what he had seen the butler doing at three in the morning. There could be no doubt what the man's intentions were; but how these became conveyed to the mind of the old lady in her dreams is not so readily explained.

JOY.

When dawn's great oriflamme o'erspreads the sky
Dark night-born shadows steal like ghosts away,
Delusions woven of gloom fade in the day,
And earth renews her pæan of ecstasy.
Light, life, and peace—the threefold magic spell—
Wakes golden morning, and without alloy
Earth thrills responsive to God's gift of joy,
Whilst all her myriad voices shout, 'All's well.'

So is great Joy God's sunshine on the soul,
Nor need the night of gloom and shadows dim
Be still prolonged to hinder from the goal
The striving soul which would return to Him,
The source and spring of joy, who freely gives
The sunshine of His joy to all that lives.

SUBTROPICAL NEW ZEALAND.

By THEODORE ARNOLD.

[The Editor has pleasure in inserting this article, which has been forwarded by Mrs Humphry Ward, and is written by her brother, Mr Theodore Arnold, grandson of Dr Arnold of Rugby.]

AS the colony of New Zealand extends over more than twelve degrees of latitude, it naturally, for its size, covers a wide range of climate and temperature. In the extreme south the mean temperature is about the same as that of the south of England, while the narrow peninsula that stretches for some one hundred and fifty miles to the north of Auckland is about ten degrees warmer. This northern peninsula has many distinctive features of its own. For one thing, the magnificent kauri-pine, one of the finest timber-trees in the world, is almost confined to this part of the colony, its extreme range only extending for a short distance south of Auckland. A curious point about this tree is that it has vanished from extensive tracts of country which are now covered with stunted scrub and bracken-fern; the only indication left of the splendid forests which formerly covered these tracts being the 'kauri gum,' which, up to the present time, is the most valuable product of the peninsula, being exported in large quantities for the manufacture of varnish. The gum, or more properly resin, is found in the ground at varying depths from a few inches up to five or six feet. In no part of North Auckland is one very far from a 'gum-field,' where the industry of 'gum-digging' is carried on with varying success by both white men and Maoris. Among the former are large numbers of Austrians from the province of Dalmatia, who, having somehow discovered this prospective source of wealth, swarmed into the country in such numbers that a few years ago Parliament considered it necessary to restrict this inrush by legislative means, to avoid the very serious disturbance of the industrial equilibrium which would be caused by the rapid exhaustion of the gum-fields and the consequent throwing out of work of some thousands of men engaged in the industry.

During recent years quite a number of these Dalmatians have turned their attention to an industry which is likely to prove ultimately of much greater and more permanent value to the district and the colony—that of vine-growing. At one time it was thought that the climate of this northern corner of the colony was not altogether adapted for the growth of the best varieties of wine-grapes, being considered too moist and equable, its predominant characteristics in winter being heavy rainfall and the almost entire absence of frost, while the summer heat is never very great, the shade-temperature rarely, if ever, reaching ninety degrees. Even up to the present time the grape most generally grown throughout the north is an American variety known as the Isabella. But experience has shown that, in suitable situations and under the right kind of treatment, many of the European wine-grapes will thrive and bear heavy crops, from which an excellent light wine can be made. Consequently the cultivation of these varieties is rapidly extending, and promises within a few years to attain very respectable proportions. To aid the industry the Government has appointed a viticultural expert, who, both by precept and by practical demonstration in the settlers' vineyards, affords the necessary instruction to all those who may require it in all matters relating to the cultivation of the grape and the manufacture of wine.

Besides the grape, almost all the fruits of the temperate zone flourish, and there is little doubt that in the not far distant future, when the gum-fields are exhausted and the greater part of the timber in the still existent forests is worked out, this section of country will find in its vineyards and orchards its most important source of wealth. While the cherry and the bush-fruits of colder climates do not succeed here as a rule, apparently requiring a certain amount of frost in the winter, the apple is quite at home, bearing early and heavily, though the fruit does not keep so well as that grown in a colder climate. Gum-land—that is to say, land which was formerly covered with kauri

[*All Rights Reserved.*]

forest—is, as a rule, inferior in point of fertility; but with suitable treatment it will grow excellent apples. On the better class of soils, provided there is sufficient shelter from the prevailing westerly winds, nearly all the fruits of the warmer temperate regions succeed admirably, and even the banana will ripen in warm and sheltered spots. The peach is a fruit that has suffered great vicissitudes in New Zealand. A generation ago groves of seedling trees were to be found scattered about in suitable situations all over the North Island, growing practically wild; but a blight or disease of fungoid origin suddenly made its appearance, doubtless introduced with imported trees, and within a year or two swept over the whole country. Many of the trees were killed outright, and those that survived were mostly mere wrecks, showing little sign of their former beauty and luxuriance. But gradually there came some signs of a revival, the trees that had withstood the first onset of the disease apparently becoming more inured to the changed conditions; and as years passed it was found that, with adequate shelter, careful cultivation, and a due regard to the selection of the hardiest and most suitable varieties, as good peaches as ever could be grown. The extreme north seems to have suffered less from this blight than any other part of the colony, and there are still to be found a few groves of wild-peaches in the Hokianga district, the part with which the writer is best acquainted. In this district a co-operative fruit canning and preserving factory has lately been started, and peaches are being largely planted, now that a local market for the fruit has thus been assured. As far as the jam department is concerned, the comparative absence of small fruits is somewhat of a drawback. Strawberries do well, and the common Kentish cherry will succeed in some localities, especially at an elevation of a few hundred feet above sea-level; but gooseberries and currants are a complete failure, their place being taken to some extent by the guava. The apricot also may generally be classed with the failures, the very heavy winter rains possibly not suiting it.

While pears as a rule do very well on suitable soils, a certain amount of judgment must be used in the selection of varieties. For instance, the climate, somehow, does not seem to suit that excellent pear the winter Nelis, which is a very shy bearer, even when it has acquired age; while most varieties, with suitable treatment, will be bearing heavily before they are ten years old. Several of the late kinds, again, such as Easter Beurré, though they bear well enough, will not ripen properly in some localities. The orange has not been very extensively grown so far, having to compete with the cheap and excellent fruit imported from the Pacific Islands, where the trees thrive without any care or attention, while here they require a good deal of both to ensure satisfactory results. So far, the Seville and other bitter oranges, suitable for marmalade, have proved the most profitable, generally bringing a higher price than the sweet varieties.

Japanese plums have been largely planted in New Zealand of late years, especially in the north, but are getting out of favour now, at least with those who make a business of fruit-growing, as it is found that they are not suitable for canning or drying, and none of them can compare in quality with the best varieties of European plums, though they have the advantages of bearing earlier and being more prolific; this climate appearing just to suit them, as it does other Japanese fruits, such as the loquat and persimmon. In an interesting report recently published by the New Zealand Department of Agriculture on *The Fruit Industry of California*, by the president of the Auckland Fruit-Growers' Union, it is stated that the Japanese plums, at one time extensively planted in that state, have since been almost entirely discarded. In a few years' time they will probably be little grown in New Zealand on a commercial scale, though they will no doubt retain a certain degree of popularity with those who like to grow a few fruit-trees just for their own use. The report in question winds up with an interesting comparison of the prospects of the industry in the two countries, the conclusion arrived at being that if the New Zealand fruit-grower brought to his work the shrewdness and enterprise of his Californian confrère in place of the haphazard methods far too much in vogue here, his lines would be indeed 'cast in pleasant places.'

GIANT CIRCUMSTANCE.

CHAPTER XV.—A LITTLE KINGDOM I POSSESS.

A FEW days later Geoff received a letter from the estate agents, stating that they had good grounds for believing that a firm offer of thirty-two thousand five hundred pounds would be accepted by the trustees in bankruptcy for the Innismohr property. He instructed them to offer that amount on his behalf; and next day, when he went across to dine with the Exmoors, he was so obviously full of something that both Ellen and Charlie were on to him at once.

'Now, old man, what is it? Another step? Old Everett retired?' demanded Exmoor.

'Islands?' said Geoff solemnly.

'Ah! Islands, is it?—Didn't I tell you'—turning portentously to Ellen—'I feared his brain would give under the strain?'

'To be perfectly truthful, you didn't. Perhaps

you only thought it, and then thought you had. —Now, Geoff, what is it?'

'Ah! "What is it?" says she. "Islands," says he. Is it the Windwards, now, or the Leewards, or what?' asked Exmoor in the soothingly persuasive tone and manner, as he believed, of a mental specialist examining a patient.

'Innismohr,' was Geoff's solemn contribution.

'Quite so! quite so! Just what I always feared,' from Charlie.

'Do be quiet, Charles,' expostulated Ellen. 'You're only making him worse.' But in her heart she rejoiced at their fooling, for it recalled the merry old days before the flood, when these two would keep her convulsed with their nonsense.

'Im—possible!' ejaculated the incorrigible one.

'If you won't be sensible I shall leave you to yourselves, and I'm really anxious to know what Geoff's face means.'

'You're just as bad as ever, Charles Doone,' said Geoff severely. 'If I had not hoped that marriage would sober you I never would have permitted it.'

'It has—terribly.—Hasn't it, my dear? Can't I be as sober as a judge when I try hard?'

'You can be sensible—at intervals. Try hard now—to please me.'

'You see!' sighed Charlie. 'Absolutely henpecked to death. Now, Geoff, my son, speak on! You have our ears.'

'I've been buying an island.'

'He's off again on the same old tack,' whispered Charlie. 'Shall I call Barton in case he gets obstreperous?'

'What island, Geoff; and where is it?' asked Ellen anxiously.

'Innismohr. I told you before.'

'Oh Lord! Now he's dropping into poetry.'

'Innismohr,' continued Geoff, in the tone of a Continental cathedral guide. 'An island off the west coast of Scotland, six miles long by four miles wide, with the dwelling-house—on a smaller island off the coast of Innismohr, by the way—and appurtenances thereof, shootings, fishings, cloud-capped mountains, burns, glens, corries, mists, the most lovely scenery, the most heavenly solitude'——

'And you've bought it, Geoff?' asked Ellen.

'I've bought it, lock, stock, and barrel. Henceforth call me Innismohr.'

'And what are you going to do with it now you've got it?' asked Exmoor.

'Does it mean that you have decided to leave the army, Geoff?' asked Ellen, jumping to quick conclusions.

'No. I've decided to give it another chance. In fact, I'm thinking—I may say I've decided—to go back to school again for a term or two.'

They both stared at him for a minute. It was Exmoor who saw light first.

'Farnborough?' he ventured.

Geoff nodded.

'Then you've got something or other up your sleeve. Out with it, old man.'

Geoff shook his head. 'Can't, my boy. Bound to secrecy. You'll know if it comes off.'

'I bet old Eisenach's in it,' said Charles sagely.

'Whatever it is, it pleases you, Geoff, and that's enough for me. Tell us more about this place you've bought,' said Ellen.

'Oh, that's all Exmoor's doing, really, you know.'

'Oh, come now! Why drag me into it?'

'If you hadn't shipped me off in the *Seamew* I should never have seen it. If I hadn't seen it I couldn't have fallen in love with it. If I hadn't fallen in love with it I should probably never have run up against it in an estate agent's window in Pall Mall, and the temptation wouldn't have been too great, and I should never have stepped in and bought it. So you see'——

'That's how we fling our money about when it comes to us unexpected,' explained Exmoor to his wife.

'It's a perfect sanctuary for solitude,' said Geoff, full of his prize. 'When you get tired of Charlie's fooling, and want a period of retreat, Nell, just order the *Seamew* round'——

'All yachts to the side-door, please.'

'Say the word "Innismohr" to Bannatyne, and he'll whisk you off to heaven. He's been there, and he knows the way.'

'Dear, dear! Who'd ever have thought it to look at Ban? But, please remember, you two, that I'm in this game, and if there's any whisking afloat I whisky too.'

'The object is to get away from you, my friend, during your temporary and much-to-be-deplored aberrations.'

'It sounds very nice, Geoff,' began Ellen.

'Innismohr, my dear!' blandly corrected Exmoor once more.

'When can we all run up and inspect it?'

'Whenever you like. I've just seven days of unexpired leave. Would you think of taking Exmoor?'

'The Earl and Countess of Exmoor regret that they will be unable to avail themselves of Innismohr's hospitality, having already accepted an invitation from a lady whose request is equivalent to a command,' said Charlie pompously.

'I forgot that. It's the garden-party,' explained Ellen to Geoff.

'I'm keen to see the place again myself,' he said; 'though I'm not at all sure that I have any right to go until the deeds are all put through. They've accepted my offer, of course; but I suppose I'm not really owner till the lawyers have done their worst. All the same, I'm inclined to run up for another peep at it all.'

And he did, and found more to peep at than he expected.

Pending completion of the red-tape business, by arrangement with the lawyers on both sides he paid the purchase-money into a special account opened for the purpose, and got permission to occupy the house for the few days he could spare.

In reply to his inquiries, he was informed that the place had been closed for some time—which was no news to him—but that a Mr Donald Cameron, one of the oldest residents on the island, had been looking after it. At Geoff's request, a telegram was sent to Mr Cameron, informing him of a flying visit on the part of the new proprietor, and requesting him to make the necessary preparations. As the telegram would have to travel some twenty miles by hand and boat, Geoff was quite prepared to find the preparations on the minutest possible scale; but to one who had just come through a campaign in the Soudan this possibility only added zest to the prospect. All he wanted was to get into the house and be sure of getting something to eat.

He went up by rail as far as it would take him, then across country in a nondescript vehicle on two wheels and a paucity of springs—a mixture of gig and butcher's cart—and landed at last on his own island from a boat chartered at the village on the mainland where he had slept the previous night.

It was a soft September morning. The cats'-paws which had beguiled them at the start had died away. After the first half-mile of their four-mile passage their sail had creaked idly, and they had accomplished the rest with their oars. A thin haze had settled on the blue Sound, so that now it shimmered blue-white under a silvery film, with flecks of gold where the tiny waves caught the sun-glints. The farther shore and hills were hidden. The only sounds were the rhythmic thumps of the heavy oars in the rowlocks of the returning boat. It was already ghostly in the haze, like a vanishing picture on a screen. Presently it passed out of sight, but the music of the oars still throbbed along the water. A solitary sea-gull came sailing along in search of breakfast. At sight of Geoff it gave a frightened squeal and shot out after the boat. The tiny waves tinkled among the stones at his feet like hoarse frogs and silver bells. 'Glad to see you! Glad to see you! Glad! Glad! Glad!' they said.

Up above, the sky was clear-blue, with a bright, thin sun. He lingered for a few moments enjoying the delicious sense of remoteness and aloofness, and the novel exultation of feeling that this land on which he had set foot was his own land—his very own. Possession is very much more than nine points of the law. It is uplifting. It is deepening. It is expansion. Very much better is a little island of one's very own than all the kingdoms of the earth that belong to other people.

He turned his back on that which was not his—save inasmuch as God's beauties belong to every man alike, according to that which is in him—waved his hand in gay salute to that which was, and strode away up the rugged road that led into his kingdom: a kingdom which was to prove a very much larger one than he knew, and the greatest part of it that which all his money could not buy.

He could not, indeed, see very much of it yet, even with his bodily eyes. The filmy haze which happed the feet of the hills, and the clouds that wreathed their summits, magnified their possibilities fivefold, and hinted vaguely that that which was hidden exceeded by far that which was revealed. But what he could see was entrancing, and as he strode along his heart was big to possess the land.

The road led straight in among the hills, and presently he had turned a shoulder and was striding through a narrow glen, with waist-high jungle of bracken on either side, bronze-green above and yellow-brown below, and all pearled with heavy dew. A tiny stream prattled down each side of the path, and, out beyond, the purple heather swept out of sight up the hillsides. Here and there a graceful lady-birch stood, coquettish as a suddenly transformed mountain nymph, among the greenery, and here and there a dark-green mountain-ash gemmed with royal-crimson berries. He plucked a bunch of berries and stuck it in his button-hole, and felt the richer for it. Now and again in the tangle on either side he heard soft rustlings. Once he got full sight of a bobbing white tail, and the brief ruffling of the bracken-tops showed which way the affrighted one had fled. If White-tail had come and sat on his foot that morning he would have stroked its ears and sent it off with a God-speed.

The bracken thinned as the glen led up into a boulder-strewn corrie, and the sunlight greeted him again round the shoulders of the hills. From the portentous bases in front, he concluded he was about to make acquaintance with the giants they had seen from the deck of the *Seamew*, and he strode on expectant.

Through the bare corrie, round the flank of a hill, and before him lay the holy place.

'Sanctuary!' he said aloud, and sat down on a rock to worship.

He was not the first by many who had worshipped there, for the gleaming mirror in the gauzy veil away down below him, over which the lazy giants kept perpetual watch, was known among the natives as Loch Naomha—the Holy Loch. And sometimes it was frosted white, as now, and sometimes it was blue as the skies that looked down on it, and sometimes it was black as death, and sometimes it was the colour of lead. Those who knew said that it had no bottom, and those who knew still more held that strange creatures dwelt in it.

The hills that cradled it were draped with pines and firs—brigades of them, legions of them. The serried ranks had come pouring over the rough hill-shoulders, and had been making headlong for the lake, when, at a word, they stiffened and rooted where they stood. That was evident from the look of them. Another moment and the mirror would have been marred, and now they stood ever looking at themselves in it, and wishing they had had their way. Here and there a straight, clean swath was cut right up the mountain-side, as though the things that dwelt in the lake had issued forth and cleft a passage to the mountain-top. And the bodies of the fallen ones still lay there stark and dead on the bared bones of the mountains.

The ends of the lake he could not see for the folding hills, and presently he was slipping and stumbling over the ankle-deep carpet of pine-needles, beneath which the jealous trees, for all they looked so solemn, were not above setting traps of sprawling roots wherever chance offered, and more than once they brought him to the ground.

He had lost the road at sight of the lake, but expected to strike it down below again. The day was still young, however, and what he had so far seen of his kingdom but whetted his appetite for more.

The far end of the lake, for instance: he must see where that went to. The other end he would see on his way back. His descent ended in a sheep-track which ran with his inclinations, and, more deviously, by the side of the water. He stepped briskly along it, and so in time found what he sought—and more.

This end of the lake turned out to be the foot, and it surpassed his expectations. An amphitheatre of wooded hills encircled it, and through one narrow, winding cleft, which looked as if it had been gashed with a mighty chisel, the waters had bitten their way to the sea.

He went a short way down the glen, and was filled with wonder. Never in his life had he seen such wealth of microscopic beauty crowded into so small a space. Every step he took disclosed some tiny masterpiece of Nature's craftsmanship, so perfect in every delicate detail of form and colour that art of man at its highest could never have matched it in a thousand years of painful striving. He would not go far, for he knew enough of glens to know that where waters rush down to the sea and cascades abound, the arduous climber meets the beauties face to face, and he who goes downhill misses much. Just a peep at the wonder, and he would turn and leave the ascent for another day.

Between the high rock-walls he caught glimpses of ethereal beauties down below, vistas and vistas of delight, in thinning atmospheres latticed with feathery foliage and thin, black stems of trees, and shot every here and there through the rifted wall with clear white bars of sunlight. It was more than tempting. He dragged himself reluctantly away, but stopped transfixed before one sheer scarp of rock tapestried with a creeping growth of most exquisite beauty—tiny waxen green leaves with filamental red tendrils of so fine and delicate a nature that their tapering points were no more than crimson threads. Down all this lacy veil white drops of water loosed slowly from leaf to leaf, as though reluctant to the fall, and for yards each lowest drooping point was gemmed with a lucent pearl. In below the green lacery he could see a smaller growth of close-clinging lichen, moss-green in the damp, and brown in places, and round a drier corner silver-gray infoiled with black. Not an inch of rock was visible. Time and Nature, working hand-in-hand, had dressed and healed the raw rock-wounds and transformed them into things of the most perfect beauty. And below, when at length the clinging pearls must fall, they fell on soft, green, swelling cushions which had once been lumps of rock.

He sat down before one of these on a boulder, with his back to the brawling stream, and meditatively filled a pipe and leaned forward, elbows on knees, to enjoy it the more intimately. From above, the moss looked a short, thick, curly growth, but when he poked it tentatively his finger sank in and found no bottom. And, looking more closely, he found it a miniature forest of tiny moss-trees, with trunks many inches long, and matted undergrowth below, and microscopic ferns no bigger than a fly's wing, so delicate and hair-like as to be almost invisible but for the paler green of their fronds.

It was very wonderful, this tiny forest whose depths he could not penetrate. Was it inhabited? Were there creeping monsters down below there, and possibly fairies? Monsters undoubtedly, for one climbed part way up a tree-trunk to have a look at him, and then fell down aghast, and probably terrified his fellows out of their slow senses by telling them that God had looked down through the roof of the world all wrapped in clouds of smoke. And fairies? Surely fairies; surely something more in keeping with the beauty of this exquisite hidden workmanship than the crawling beast he had seen.

He felt like Gulliver looking down into Lilliput. He felt himself of larger growth than usual. As he sat peering absorbedly into that tiny cosmos, he grew unconsciously. His thoughts were higher and deeper and wider than their wont. He was in the humour to see great things in small; to see past things, indeed, to the source of things. He only knew that he could have sat for half a day before that green cushion and still not learned an inch of it; but unconsciously his heart was tuned to worship.

And suddenly, above him, there floated a sweet, mellow call: 'Yo-ho—eeho—eeho—eeho—eeho—ee—ho-o-o!'

He sprang to his feet. Here was something human, and Nature was forgotten. From some point down the glen the call came back, fined somewhat, but full and mellow still: 'Yo-ho—eeho—eeho—eeho—eeho—ee—ho-o-o!' And again, more faintly still, but sweet and clear, from some far hollow of the hills around the lake: 'Yo-ho—eeho—eeho—eeho—eeho—ee—ho-o-o!'

He softly tapped out his pipe, and strode noiselessly up the glen to investigate this sweet, surprising challenger of echoes.

That the yodeler was a girl he was sure—and young and fair without a doubt. There was a rich, gladsome life in that fluty peal that could belong to no other than a beautiful girl. His imagination endued her already with all the charms and graces of the unexpected and the unknown. So lovely a voice must surely have a lovely owner, and he hastened to find out.

He expected to find her standing there. But she had sounded her call and passed on. He saw a shapely figure swinging with light, free step along the way he had come. But all he could see was a vision of a well-poised head, with coils of dark hair and a blue tam with an eagle's feather sloping out of it, short swinging blue skirts, a very neat pair of strong little mountain brogues with low, flat heels and a spring in them, and a stout crooked stick twirling gaily in a white hand. What man alive but would have wanted to see more? And more was vouchsafed him.

He was wildly cogitating the least ridiculous inquiry which might reasonably excuse his addressing her, when a friend intervened.

From among the close-set pines a big collie came bounding into the open, leaped joyously at his mistress, caught sight of Carrick, and smiled him hearty welcome from ear to ear.

None of your high-bred, flat-headed, wolf-nosed show-dogs this. Just commonest black-and-tan flecked out with white, nose rounded, laughing mouth, head arched enough to hold brains and beautifully carried, well-bushed tail, and eyes full of faith, hope, and charity. His instinct recognised Carrick as harmless. He came bounding up to make friends with him.

Geoff stooped and smoothed the rough head and looked into the beautiful eyes.

'Colin! Heel, sir!' and the dog laughed up at him and went bounding back, gaily obedient, not by any means servile.

The girl had turned and stood looking at the stranger, and the stranger looked at her and felt within him an odd sense of satisfaction. She was quite all he had hoped from her voice, and—well—yes, more—much more.

There was something absurd and incongruous in standing there staring like a cow at a beautiful girl.

He stepped towards her and lifted his cap, and asked, 'Pardon me! Can you tell me if I can get to Innismohr House by this side of the loch?'

The question was not, perhaps, after all, so ridiculous as it sounded, for if there should be no path the passage would be difficult, if not impossible.

She hesitated a moment, flushed slightly, and then said coldly, 'Yes, there is a path;' and then sharply to her dog, who was edging forward at her side towards a furthering of his short-cut friendship with the stranger, 'To heel, Colin!'

Then she turned and walked away.

It was a very fair face that had been turned to him; but, even as he looked, the natural arch of the soft, dark brows had subsided till the brows were defiantly level, and the surprise that had heightened the charm of her at his unexpected appearance darkened into a look which puzzled him exceedingly.

What was it? Her eyes were large and dark. He thought of big black pansies as he looked at them. As a matter of fact, they were very deep blue; though, truly, at times they could look black enough, and just now they were at their blackest.

What was it that looked out of them? Scorn, he was sure, and affront, and detestation, and more besides.

Heavens! what had he done to darken so fair a face with feelings such as these?

He stood looking after her, wondering and disconcerted, void of offence, yet palpably condemned. Not worthy even to speak to her dog!

Not until she struck up suddenly among the pines and vanished did he turn and tramp on his way, kicking loose stones out of his path now and again for the relief of his feelings. One does not too readily lie down to be kicked even by a beautiful girl, and that girl had kicked his soul with those great dark eyes of hers.

'What an extraordinary young person!' he said to himself. 'And what the deuce have I done to deserve it all?' and as that particular stone had no reasonable answer ready, he sent it to spend the rest of its days under water.

Note, now, the deft play of Circumstance—or Chance, or Fate, or, as some of us hold, of a greater, deeper, loftier, tenderer, and mightier power than any of these—in bringing this meeting about.

Had Geoff kept to the road and gone round the head of the loch to his destination, he would not have met the girl.

If he had gone right on round the foot of the loch, without stopping at the glen, he would not have met the girl.

If the beauties of the glen had seduced him to pry still deeper into its mysteries, he would not have met the girl, and would probably have developed a belief in sweet spirit-voices that amused themselves by yodeling among the hills.

It was a miracle that they met—one of those little miracles that still abound in this workaday world, without which it would be so much the poorer, if indeed it could go on at all. For she had come down through the pines over the hill-shoulder by the glen, intending to pass up the opposite hill, and she had got no glimpse of him, or be sure she would never have called up the spirits of the loch and glen for his benefit. It was all a matter of minutes. But the clock was set for them, and they had to meet.

You may say that if they had not met then, they might have met later. But once you begin that kind of talk I must decline to argue, for therein you open up all the possibilities. Anything *might* happen, so it is best to stick to facts, and the great fact is that they met, when they might just as well have missed.

And they parted, neither of them apparently one whit the better of the meeting; both, in fact, the worse of it—she boiling with scorn and detestation; he carrying with him an indelible picture of her, set in a frame of wonderment which drew his thoughts like a magnet.

(*To be continued.*)

WORRY, AND HOW TO CURE IT.

By D. S. R. C. Rao, M.A., M.B., Ch.B.

'DISEASES desperate grown are by desperate appliances overcome,' says Shakespeare. Desperate things are always painful enough to put up with, especially if they are incurable. Man's daring deeds expose him to certain terrible dangers; woman's weak frame turns trivial ills into gigantic evils. Even children have their own particular ailments from which adults are exempt. But worry affects people in every station of life. Man, woman, or child, no one is exempt from its dire attacks. Rich or poor, humble or great, weak or strong, educated or ignorant, all have cause to exclaim at some time or another, 'I am so worried! I wish I could shake it off!'

What is worry? It takes different forms with different people, and depends greatly on circumstances and environment. It is a kind of mental unrest and dissatisfaction preying upon the vitality of the human being. Some unexpected event occurs, or something undesirable seems likely to happen. We get a shock in the first instance. Then we begin to think of what has caused this shock—to think and think, always of the same thing and always in the same way. This thought haunts us wherever we go, and dominates our every action. Appetite fails us. We cannot smile at tea-time, or appreciate a joke made at dinner. We try to make ourselves interesting, but our friends feel that 'the spirit is not there.' The approach of night increases this terrible feeling of anxiety. Then hours of wakefulness, aimless tossing in bed, a horrid dream vaguely exaggerating the possibilities of our misfortune, all make us feel helpless and sick of life. But the daily round of duty has to be gone through, and in the course of days, months, or years we become reconciled to our lot; and more often than not we find that our calamities have been more terrible in anticipation than in realisation. Thanks to the wonderful cure which lapse of time effects, sooner or later we realise how groundless have been our fears and how insignificant our imaginary or exaggerated troubles. 'Why did I worry about such a simple thing?' we now ask ourselves.

A wit once humorously defined a philosopher as one who despises past calamities, defies future troubles, but yields to present ills. This definition is especially true with regard to worry. On looking back we feel very sorry, and even ashamed, that we should have allowed ourselves to be worried by such a trifle. We make up our mind then and there not to worry again, and assume an attitude of defiance towards anything that may happen adversely in the future. But as soon as an unexpected trouble or petty jealousy appears in our path, we lose our mental equilibrium once more, and yield to the influence of worry as badly as before, if not worse.

We hardly realise the harm we do ourselves and others by worrying. The proverb, 'It is not work that kills, but *worry*,' shows how well the world in general realises the harm that worry works. The brain receives certain impressions, and these impressions, passing along well-defined tracks, create what I may for convenience call channels. Every act performed by us creates and transmits a new set of impressions, which pass along another set of tracks. Thus when we worry we create horrid visions of calamity, which are transmitted in the form of impulses through their own set of channels. When once this channel is created, its impulses travel along it with ever-increasing ease; so that the same picture haunts us wherever we go, assuming a more and more terrible aspect in proportion as we yield to its influence. When we think about it, talk of it, lament over it, and torment ourselves and others respecting it, we again create impulses which travel along another set or other sets of channels, passing more easily and rapidly every time we repeat the act. The waste of energy and expenditure of brain-power involved in the act of worry may be easily imagined. A day's intense worry may work more harm to a person's health than a week's hard work would accomplish. Think, too, of the depressing influence we have upon the spirits of those who are brought into contact with us. It is hardly to be wondered at that the average man or woman is reluctant to spend much time in the uninteresting, not to say wearisome, company of a lady who is always lamenting the splash of ink on her new tea-gown, or of the man who is constantly bewailing his hard lot caused by the inferior quality of the last ounce of tobacco. If we could only see the sorry figure we cut at such times in the eyes of those whom we respect the most! Not only do we bore our friends, but we bring upon ourselves acute and often prolonged mental prostration and physical breakdown as the result of worry. The best way to avoid this state of things is to refuse to worry about anything. At first sight this may seem hardly feasible; but it is half the battle if one can only realise that it is possible to banish worry altogether from one's category of evils by a real determination to get rid of it, and by taking proper precautions to avoid it.

There is no doubt that worry is a universal disease, and with some people it may be said to have become chronic. Therefore, the cure ought to be universal too, even if it has to be brought about in some cases by heroic measures.

Physicians are gradually coming to realise the wonderful and subtle influence of body on mind and mind on body. During the period of convalescence, after a prolonged and exhausting disease, the patient is generally very irritable, and the

slightest mishap causes him more than an ordinary amount of worry. When the body is weak and exhausted, the brain seems to lose its controlling and rationalising power—so much so, indeed, that trifling accidents assume the proportions of grave calamities, and appeal strongly to the emotions. Therefore, when one realises that the petty affairs of life, which do not usually cause one any anxiety, are gradually dominating the imagination and causing vexation and worry, one may make up one's mind that the constitution is run down and is demanding rest and change. I may mention here that *short but frequent* holidays are more beneficial to a person working hard both mentally and physically than a long rest taken after a sustained period of work. Looked upon in this light, worry is a *danger-signal*. It is wonderful how one forgets all one's worries after a little rest and a short holiday!

During the holiday one must make up one's mind to forget every direct cause of worry. This very act of trying to forget may seem to make the worry stronger still. But this must not be allowed to discourage us; we must try to forget, and try again and yet again. It is wonderful how soon things may be forgotten. By thinking and talking of our troubles we strengthen the impression they make on the brain, and the stronger the impression the greater and longer the worry. Our thoughts, somehow, always seem to tend in that direction, however hard we try to divert them into a healthier channel; but if we persevere we shall most certainly succeed—and often very quickly. Let us leave behind all associations of every kind that may remind us of our cause for worry in the very slightest degree, and the worry will disappear.

I have so far dealt with the negative side of the question. The act of worrying forces us into one particular groove of thought. From the positive point of view, the best way to get out of this groove is to create a new current of thought which flows through other channels. Thus energy is directed into other paths, leaving the old one disused and in time incapable of transmitting the old current. To make my meaning clear, let us suppose that you are worried about some monetary transaction. The best way to banish your trouble from your mind is to take an interest in something quite different—music, poetry, or painting, for instance—and to devote your whole mind to it, not giving your worries a moment's thought. This new interest will buoy you up and give you fresh strength to overcome your morbid feelings. Choose for your companions those who will encourage this new train of thought, and welcome anything that will open out new vistas of happiness. When you have once left the old groove, and have begun to bask in the sunshine of pleasanter and happier surroundings, you must follow up your new interests with vigour or you will relapse into the old state of mind once more. Thus a determination to overcome, a timely rest and change of air, congenial surroundings, and fresh trains of thought and new interests in life contribute not a little to remove the habit of worry, to which we are all prone.

Happy is he who can take life in the philosophical spirit of 'Whatever is is best,' for worry dare not touch him. I have personally tried the methods advocated above, and have found them very useful helps in the storm and stress of life. So I hand on these suggestions to others, in the confident hope that they may be found useful sooner or later.

What bright possibilities might life not hold out if only that big dark cloud 'worry' could be dispelled from its horizon!

DORNAY'S REVENGE.

CHAPTER III.

SUDDENLY Dornay heard voices immediately below his window, and presently he became aware that the two late arrivals had caused chairs and a small table to be brought out of doors, and, late as it was, were about to wind up the evening over cigars and a bottle of wine. 'Bed is unbearable on such nights as this,' he heard one of them remark.

'Yes,' replied the other. 'If only one could hibernate during the cold months, and do without sleep this sweltering weather, that would be something to be thankful for.'

A lighted candle had been placed on the table, and its flame rose steadily in the still air. Presently the odour of tobacco reached Dornay's nostrils. He was seated on a lounging-chair close to the window, and every word spoken by the strangers on the lawn came plainly to him. But anything they might have to say was no business of his; it had no interest for him, and did not take his attention. His brain was busy with his own affairs. What was going on in the room with the balcony? Was Sir Gerald still sleeping peacefully, or had the poison already begun to work in his blood?

So extreme had been Dornay's self-absorption that for some minutes his mind had not taken in a word spoken by those below; but the mention of Sir Gerald Udale's name brought him back with a start to the realities of time and place, and set him listening with all his might.

'I have been Sir Gerald's lawyer ever since he came into the title and estates,' remarked one of the men, 'and, as you are aware, I have an appointment with him at ten o'clock to-morrow. His life, uneventful as it may have seemed to outsiders, has not been without its romantic episodes, with all of which I am, of course, acquainted.'

'Then don't keep them to yourself, my dear fellow, so far as I am concerned,' responded the other. 'Seeing that you are about to introduce me to the baronet as your future partner, you may as well post me up with regard to the facts of his personal history before you do so.'

'So be it. You must know, then, that the baronet, who has long been a widower, was married some years before he succeeded to the title. His sole offspring was one son, who at the age of twenty-two fell in love with a beautiful girl in a gipsy encampment, who passed by the name of Velma Robins. They eloped and were married. When the news was told Sir Gerald he discarded Myles as a disgrace to his family, and never saw him afterwards; but the latter had three hundred a year of his own, so that the young couple did not starve. After a time a daughter was born, but at the expense of the mother's life; while, a twelvemonth later, Myles was accidentally drowned. Sir Gerald caused the parentless infant to be put out to nurse; but when it was about four years old he had it brought to the Croft, which since then has been its home, and to him the child of his dead son is dearer than aught else on earth.

'Well, one day a very old woman presented herself at the Croft, and asked to see Sir Gerald, to whom she introduced herself as the "queen of the gipsies." For the sum of twenty pounds she offered to reveal to him certain facts connected with the history of his late son's wife which otherwise he would never be told. The baronet, who had never seen reason to doubt that his daughter-in-law was a gipsy born and bred, closed with her offer. Then it came out that the girl Myles Udale eloped with had, when an infant, been stolen from the charge of its grandparents, persons in a very humble sphere of life, to whom it had been entrusted by its father, a man named Dornay, at that time with his regiment in India. It had been in the hope of appeasing the passionate maternal longing in the heart of the gipsy queen's daughter, who had lately lost her own child, that the other child had been kidnapped. All this Sir Gerald wrote down with his own hand, and caused the old dame to affix her mark to it in the presence of witnesses.

'A few days later the document in question reached me, with the request that I would engage the services of one or more private inquiry agents with the view of testing the validity, so far as it might now be possible to do so, of the statements contained therein. This was accordingly done, and resulted in a very singular discovery.

'It appeared that the mother of the so-called Velma Robins was not dead at the date of the child's abduction from its grandparents, but that she had eloped some time previously with a man now proved to have been none other than the baronet's younger brother, Captain George Udale, who some years later died of fever in the West Indies. What became of the woman he eloped with it was found impossible to ascertain. And that is what may be termed the Udale romance. I felt a spot of rain just now. What say you to turning in?'

Dornay heard no more. All that concerned him had been told, and what a revelation it was! He stood up, and clasping his head between his hands, he tried to steady his brain sufficiently to enable him to think coherently. His diabolical plot—he saw it now for the first time in all its hideousness—had been aimed, and only too successfully, at the life of an innocent man; whereas the man who had so bitterly wronged him had died long years before! Yet he (Dornay) had cozened himself into the belief that if his enemy were dead the fact would have been intimated to him after some vague, mysterious fashion, and, further, that the unseen powers which minister to mankind had favoured his long-delayed scheme of vengeance and decreed that it should not fail. Oh, how he had been befooled! His heart was as gall within him.

Thereupon his mind reverted to another of the disclosures overheard by him, one which at any other time would have filled him with an amazement bordering on unbelief, but which was now accepted by him without a shadow of doubt. The girl he had seen pacing the terrace was his own granddaughter—his and Sir Gerald Udale's! Surely it was one of life's ironies that such a thing should have come to pass!

His thoughts were still somewhat tangled, and there was a buzzing in his head as though a bee were shut up in it. Only now did the question flash upon him whether there was any possibility of saving Sir Gerald's life. That the death-fly had done that which it was intended to do was hardly questionable. It had purposely been left unfed in order that it might the more surely accomplish its gruesome task. It would indeed be a horrible thing if Sir Gerald should die, and his (Dornay's) be the hand that had slain him!

Then he recalled the fact that at their parting Ram Das had put into his hands a small sealed packet, saying as he did so, 'Shouldst thou at the last moment wish undone that which has been done, open this and—but not otherwise.' More than once the words had recurred to his memory, but only to be dismissed as having no possible significance for him; for it was preposterous to assume that he should wish undone the one grim act the fulfilment of which was all he lived for.

But now! In the course of a few short minutes the world had become a changed place and he a changed being. No more time must be given to thought: action—action was the imperative need. The two strangers had come indoors, and not a sound was anywhere to be heard. Having lighted his candle, Dornay passed into his bedroom, and then from his portmanteau he drew forth the packet given him by Ram Das. Having cut open the linen wrapper in which it was sewn up, he extracted a closely stoppered phial filled with some kind of liquid matter, blood-red in colour. Round it was a strip of parchment on which in Hindustani was

written these words: 'The wise man is he who is always prepared. Wherefore, in making thee a gift of the death-flies, I give thee also an infallible antidote for their poison—the constituents of which are known to few beside myself—provided it be administered not later than three hours after the fly has done its work. Take it, and should thy need be imperative, use it.—Thy friend, RAM DAS.'

For some seconds Dornay stood and stared at the writing like a dazed man. Then, as he crushed the parchment in his hand, he said aloud, 'After all, it may not be too late to save him. But not a minute must be lost.'

Quickly resuming his vest and coat, he put the phial in his pocket, blew out the candle, and opened the door. Then it struck him that the house was shut up for the night, and that to leave it without being overheard would be no easy matter. So he closed the door and crossed to the window. Two minutes later he had dropped from it to the ground and was hurrying in the direction of the Croft. But a difficulty now confronted him which he had not foreseen. How could he gain access to Sir Gerald? He might as well be without the antidote unless an opportunity of administering it were afforded him. He could only trust that the chapter of chances would bring about the needed opportunity.

So he took the road which had now become so familiar to him, and did not halt till he reached the seat under the cedar, whence the whole south front of the house was open to him. A faint light was beginning to broaden in the east, but here darkness still reigned. In none of the many windows was a gleam of light visible: apparently the household still slept undisturbed.

Presently Dornay, in a fever of unrest, made his way to the north side of the house, where were the domestic offices and the stables. Here, too, all was darkness. But even while he was looking, and wondering what his next step ought to be, lights began to appear, first in one room, and then in another. The household had suddenly become astir.

Dornay hurried back to the south front. Yes, there was a light in the balcony window, faintly discernible through the interstices of the blinds. Sir Gerald had awoke ill, and had rung for help. The death-fly had fulfilled its deadly mission.

But it was useless for Dornay to linger outside the house; his task lay inside it, in the balcony room itself. Back he went to the north side, but scarcely had he reached there before, by the light of a lantern, he saw a man lead a horse out of the stable, mount it, and ride off. 'He has gone to summon the village doctor,' said Dornay to himself; and on the instant his mind was made up.

One of the doors in the back premises was wide open. Entering the house by it, he found himself in the servants' hall, now empty, and lighted by a small lamp. Opening a door at the opposite end and passing through, he saw before him a flight of steps, which he ascended, and thence traversed a corridor which brought him to the foot of a staircase down which an elderly woman was coming as quickly as her corpulence would allow of her doing. At sight of Dornay she gave a frightened start and came to a sudden halt.

'Madam,' he said as he raised his hat, 'in me you see not a burglar but a doctor. Your master is ill. Take me to his room. It may be a matter of life or death to him.' Then, reading in her face a very natural hesitation, he added in a tone of authority, 'Every moment may be of the utmost consequence. Conduct me at once to Sir Gerald's room.'

With that he began to ascend the stairs; seeing which, the woman turned without speaking and went back. Dornay followed her down a long corridor to a spacious landing at the head of the great staircase, where she opened a door, and merely saying, 'This is my master's chamber,' left him standing on the threshold.

It was a room of considerable size, very plainly furnished. On a huge four-poster bed lay Sir Gerald, tossing like a man in the early stages of fever. His face was flushed and his lips parched, and the light of recognition no longer shone out of his eyes. He was like a stranger staring about him in a strange place, and every now and again muttering a few incoherent words. His hands kept on opening and shutting spasmodically, and every few seconds he clutched at the counterpane. By the head of the bed stood a staid-looking man in black, whom Dornay rightly judged to be the baronet's body-servant, and who stared at him in speechless amazement.

Dornay stepped into the room and shut the door. 'Your master is ill—very ill,' he said. 'I am a doctor, and am here to see whether I cannot be of service to him.'

'But Dr Tatham, who always attends him, has just been sent for, and'——

'I am quite aware of that; but it may be some time before he arrives, while I am on the spot; and it seems to me that if your master's life is to be saved he must be attended to at once. Judging from appearances, Sir Gerald is suffering from some kind of poison.'

'Poison! Oh lor', sir!' ejaculated the man.

'Poison not necessarily imbibed into his system with anything he may have had to eat or drink, but probably due to the bite of some venomous insect; none the less deadly, however, on that account.' He had advanced to the bedside, and he now bent over Sir Gerald. Then lifting up one of the baronet's hands, and pointing to a dark-blue patch about the size of half-a-crown on the inner side of the wrist, he said, 'Yes, it proves to be as I thought. Here is the mark where he has been bitten, or stung, by some poisonous insect. Something must be done for him without delay, or I will not answer for the consequences.'

He looked at the man, whose complexion had faded to a greenish-gray tint, and the man looked at him. 'Fortunately—most fortunately,' resumed Dornay, 'I happen to have with me a certain drug

which, if administered at once, will, I have no doubt, afford Sir Gerald immediate relief. He looked round. 'I do not see a teaspoon in the room. Oblige me by fetching one.'

His tone was so authoritative that the man went without hesitation. No sooner was he gone than Dornay's keen glance went in search of something which he was not long in finding. There it was—the death-fly—clinging to the bed-furniture, where it had settled after supping its fill. With an execration not loud but deep, he brushed it to the floor and set his heel upon it.

Wilson was back a moment later. At once Dornay instructed him to raise his master into a sitting posture and prop him up with pillows; then from the tiny vessel which Ram Das had given Dornay he extracted a teaspoonful of its contents and proffered it to the sick man. 'Drink this, sir; it will give you relief,' he said.

He was very doubtful whether Sir Gerald would comprehend what he said, so far away from his surroundings did the latter seem. However, he opened his mouth as an automaton might have done, and swallowed the contents of the spoon. Three times was the process repeated, and then he was allowed to resume his recumbent position.

Not many minutes went by before the effects of the drug became observable. Sir Gerald's breathing became softer and more regular; the feverish flush died out of his features, leaving them of an almost waxen pallor; he no longer rolled his head from side to side, and his hands became perfectly quiescent. A gentle perspiration began to bathe him from head to foot, and Dornay drew the bedclothes more closely about him.

Turning to the wondering Wilson, he said, 'Your master is saved. My task here is at an end, and I will go. But bear this in mind: on no account must Sir Gerald be disturbed till he awakes of his own accord.' With a parting nod to the man, he took up his hat, and after a last glance at the baronet, he passed softly out of the room.

On the landing some half-dozen domestics had gathered, among them the housekeeper, who now advanced. Anticipating what she was about to ask him, Dornay said, 'All danger is over. The drug administered by me has worked wonders—nay, it has saved Sir Gerald's life. He is now asleep, and'—

But here occurred an interruption. A youthful, white-robed figure came with a rush down the corridor, and clasping one of Dornay's arms, cried, 'Oh, kind Mr Doctor! do please tell me how dear grandpapa is.'

For a few seconds Dornay looked down on the sweet, tear-stained face in silence. 'His granddaughter—and mine!' he whispered to himself, and his heart swelled within him.

Then, in a voice curiously unlike his ordinary one, he said, 'My dear child, I promise you that your grandpapa will be quite well again in a few days. All danger is at an end.'

'And it is you who have saved his life!' exclaimed the child. 'Oh, how good of you!'

'Ah, if only she knew!' murmured Dornay under his breath. Then aloud, 'I am going now, and you will never see me again. Will you not give me one kiss to remember you by?'

As he put the question he went down on one knee.

'Of course I will, you good, kind man,' replied the child as she advanced her face to his. 'There—and there—and there!' Three times she kissed him.

Dornay passed a hand caressingly over her hair; then drawing her face close to his, he pressed his lips to her forehead, murmuring something in Hindustani as he did so. Then he rose to his feet, turned, and went without a word, the domestics falling back to let him pass. Down the great staircase he went, and across the entrance-hall to the front-door, like a man in a dream. A page, waiting there to admit the expected doctor, opened the door for him, and so he passed out into the wan light of an overcast morning punctuated with spurts of solid rain.

Before he reached the 'Red Lion' a gig drove rapidly past him, in which sat Dr Tatham on his way to the Croft. He had been from home when first summoned.

Three hours later Dornay caught the morning train for the south. As he settled himself in a corner of his compartment he said, 'And now for Sarunjah, there to linger out the remainder of my days! Ram Das and I will have much to talk about; and I think my two sons will be glad to see their father's face again. Nay, I am sure of it.'

THE END.

BORACIC ACID OR BORIC ACID.

'A WEAK acid obtained by the interchange of sulphuric acid and borax, and by purification of native borax.' That is all the description given by the pharmacopœia of this important substance; and I think a few observations may be made regarding the hot springs and jets of vapour which are among the most important developments of chemical industry in Italy.

Formerly all the boric acid of commerce was obtained from borax by heating it with calcined ferrous sulphate in closed vessels, whereby sodoforic acid was formed, and boric acid was carried on with the watery vapours, which escaped.

This was a long and tedious process, and not much

progress was made until it was discovered that boric acid could be obtained from the boiling springs and jets of vapour in Tuscany. Long after the discovery of boracic acid in these springs, the brilliant idea struck the physicist as well as the chemist to employ the heat of the natural steam-jets. This method had the effect of converting an unprofitable branch of industry into one of the most successful. The lagoons are situated near the top of one of the highest hills. As the volcanic vapours pass through the water of the lagoons the boracic acid is arrested by the water, which becomes impregnated with it. In California it occurs as the mineral sassolite, and as a saline incrustation on the crater of a mountain in the Lipari group, north of Sicily.

The following are a few of the uses to which boracic acid can be put. There is, for example, not a more irritating trouble than that caused by the blood getting too inflammatory, especially in the warm summer weather. A little of the boric powder should be dusted over the inflamed part, and in a short time the pain and itching will cease. All who serve in shops, or others whose occupation keeps them on their feet a great deal, are often troubled with chafed, sore, and blistered feet, especially in extremely hot weather, no matter how comfortably their shoes may fit, and may with advantage use the acid. Another very important use to which boric acid may be put is in the case of swelled gum or tender mouth; here it is just as effectual and as easily applied. A teaspoonful of the acid in a glassful of water is used as a mouth-wash, or it may be applied on a tooth-brush. There is also a very large quantity of boric lint used in many ways. The lint is prepared by being steeped in hot water in which there is a certain quantity of boric powder till it has become thoroughly saturated. It is then dried, and is ready for use as bandages in cases of accident. It is made ready for the market by being put up in one-pound packets to suit the convenience of the medical profession and of others who may require it.

LIFE GUARDSMAN SHAW.

A HERO OF WATERLOO.

By E. Bruce Low, M.A.

A RECENT remark of a writer in *Chambers's Journal* that 'there are few family histories that cannot furnish material for the novelist and biographer' has been the means of bringing to our notice that there still live in this country descendants of a Waterloo hero who was known throughout the length and breadth of Great Britain, and whose glorious death on that field was universally lamented.

Life Guardsman Shaw was looked upon by the citizens of London and of his native county of Nottingham as the embodiment of courage, coolness, and bull-dog tenacity. 'Old Shaw the Life Guardsman!' says Dickens in *Bleak House*. 'Why, he's a model of the whole British army in himself. Ladies and gentlemen, I'd give a fifty-pound note to be such a figure of a man.' He had come to London from Cossall, his native village, a short time before entering the army; and in an age when pugilism was patronised by all classes, his feats in the prize-ring brought him to the notice of princes and peers, and rendered him the hero of the whole sporting fraternity. When he had reached the age of eighteen years he was cordially received into the ranks of the Second Life Guards, where pugilism was then much cultivated. He is described as remarkably large-limbed for his age, of great muscular strength; and it is satisfactory to know that he possessed a fair education and held a good character, with the result that it was not long before he was promoted to the rank of corporal, which, as is well known, corresponds to that of sergeant in line regiments.

Numerous incidents in his career at this period are still remembered in the ranks. At the beginning of the nineteenth century it was usual for the lower orders to cast vulgar abuse upon private soldiers, and on one occasion Shaw was followed and insulted by a number of strongly built roughs. Determined to put an end to the continuance of this practice towards himself and his fellows, Shaw resolved to tackle the crowd, and soon threw three of their number sprawling in the gutter; but on recovering themselves they again set upon the Life Guardsman. In a few minutes he had dealt out such a lesson to them that the whole crowd was put to flight. He had not again to face such an encounter. After this Colonel Barton took him in hand and introduced him to the Fives Court, which was regarded as the Carlton Club of pugilism in London. At his appearance in this new arena he was described as follows: 'His height, weight, length, and breadth were of so valuable a nature that, united with a heart that knew no fear, they rendered him a truly formidable antagonist.' The Cockney public, as well as the army officers, took him up, and he soon justified their faith by fighting some of the celebrated pugilists of the day, including Molyneaux and Colonel Barclay of Ury.

It was at this time that he was selected by the

well-known artist Haydon to sit as his model for some of his famous paintings. In height he was over six feet, with a fair complexion, gray eyes, light hair, and a round visage, and so magnificently developed as to be universally admired.

His last prize-ring encounter took place on Hounslow Heath on 8th April 1815, when enormous crowds turned out from early morning to visit the scene of the fight. Shaw had boldly challenged all England for the championship. Three other competitors entered the ring in succession. These were Harmer, Skelton, and Painter. The first two fought twenty-eight rounds before Harmer was declared victor; and finally Shaw found his antagonist in Painter. Of the latter it is related that he had distinguished himself in numerous encounters previously, and had beaten men apparently twice his strength, and, like Shaw, had tackled and overthrown a crowd of bullies who had insulted him at Manchester. In this encounter with Painter, however, Shaw soon gained the upper hand; and it is reported that although Painter delivered some terrific blows, Shaw seemed to be able to do what he liked with him, and ultimately, after half-an-hour's fight, completely overcame his opponent. This victory left Shaw virtually champion of England. Less than a month before this, Napoleon Bonaparte had returned to France from Elba, and Wellington had hurried from the Peace Conference at Vienna, with full powers as Commander-in-Chief of the Allied Army, to oppose any movement which 'the little Caporal' might make towards the Rhine or the Belgian capital. Shaw had henceforth to face the sterner work of the battlefield; for, although his admirers offered to buy him out of the army when the order for foreign service was received, he refused, and the following facts, made known to us by a near relative, and, we believe, now published for the first time, make his refusal more meritorious than has hitherto appeared. It seems that when war broke out Shaw was hurriedly married before leaving England, and placed his young wife in the safe keeping of her own parents, who resided in the neighbourhood of Rugely in Staffordshire.* A son was born, who remained with Shaw's widowed mother, and later, when a youth, earned a living as a miller. If Shaw was the hero of London sportsmen before the war, he immediately became the idol of the whole nation at Waterloo. After a short period spent in cantonments with the First Cavalry Brigade, under Lord Edward Somerset, Shaw's regiment received orders to march to Quatre Bras on the morning of the 16th of June, the day when Napoleon was defeating the Prussian army at Ligny, while Ney was endeavouring to gain a similar victory over the hastily formed advance guard of the British army. Wellington had prophesied, after an inspection of the dispositions of the Prussian army, that it 'would receive a most d—d licking,' and this was amply fulfilled, with the result that the victorious British wing of the allied army was compelled to carry out a parallel retreat, so as to protect the Prussian flank and at the same time cover Brussels.

On the 17th Shaw's brigade saw some fighting with the French cavalry in the neighbourhood of Genappe, when the Guards overthrew the lighter French lancers. Thereafter the retreat was completed without molestation, and the brigade took up a position on the high ground through which the main road to Brussels ran. A corresponding parallel high ridge was soon occupied by the French army. The country has been too often described to necessitate other details being given here; but the reader may be reminded that on the extreme right of the British position lay the château of Hougomont, in the centre the farmhouse of La Haye Sainte, and on the extreme left the village of Papellotte. The Horse Guards were drawn up on the slope in the rear of La Haye Sainte, and here some of the fiercest fighting of the day took place. As is well known, the soldiers spent the night of the 17th and the morning of the 18th in the greatest discomfort, after their long march from Quatre Bras in the sweltering heat of midsummer. A downpour of rain continued throughout the night in tropical torrents, while the lightning played around them. The men were without protection, and lay upon the muddy ground, rising next morning thoroughly stiff and chilled. Shaw's regiment was composed of tall, muscular men, about six feet in height, and the powerful black horses which they rode exceeded sixteen hands high. Every man wore a brass helmet with a blue-and-red crest and a scarlet-and-white plume on the left of it. Unlike the French cavalry, they had discarded the cuirass. Their dress was a double-breasted red coat, with blue trousers, and they wore a sash of scarlet round the waist. Their arms were carbines, pistols, and long swords. The Second Life Guards were commanded by the Honourable Lieutenant-Colonel E. P. Lygon, son of Earl Beauchamp.

At eleven o'clock, when the first cannon-shot was fired, Corporal Shaw was engaged with some of his comrades at a distant part of the field foraging for supplies; but he sharply called together his men, and had joined his regiment before the first cavalry charge was made.

The advance of Prince Jerome's corps on Hougomont took place about one o'clock; and while the attention of the British army was directed to that quarter, Bonaparte delivered his first grand attack upon the centre and left of the allied position. The French force employed was of overwhelming strength, and succeeded in producing a panic among the Dutch-Belgian troops slightly in advance of the

* When War anew her tocsin pealed,
And Honour called thee to the field,
Thou started'st to thy post again,
And Love and Beauty pled in vain.
Thou left'st them all—yea, dropped the hand
But just made thine by Hymen's band,
And changed it for the battle brand.

cross-road which marked the crown of the ridge behind which the allied army lay. The attacking infantry force was composed of four divisions from D'Erlon's infantry, Roussell's cavalry division, a division of light cavalry, chasseurs, and lancers, and seventy-four guns. The advance of the French infantry compelled the British battalions to deploy into line; and so soon as this was effected, Roussell's cavalry charged among the allied regiments and cut into a number of them, with the result that the moment appeared so critical that Lord Uxbridge, in command of the British cavalry, was compelled to take immediate action. He ordered the Union Brigade on the left to support Picton's troops, who were being threatened by three French divisions, and he himself determined to lead Lord Edward Somerset's brigade of Guards simultaneously upon the fourth of the infantry divisions, which had reached the British line on the west of La Haye Sainte, and, if possible, to overthrow at the same time the cuirassiers and carbineers composing Roussell's cavalry division.

In the British advance the First Life Guardsmen rode on the right, the Second Life Guards on the left, and the Dragoon Guards in the centre. Corporal Shaw occupied the centre of the left squadron of the Second Guards. Opposed to him was a line of cuirassiers. Both forces were riding at full speed, and neither attempted to draw rein or to avoid the combat. It was remarked that in consequence of the British swords being shorter than those of the cuirassiers, the Guardsmen were forced to wedge themselves in between the files of the enemy before they could strike effectively. This they were able to do exactly as in the Heavy Brigade charges at Balaklava, by superiority of weight and strength. Lord Edward Somerset compared the ringing of the British sword upon the French armour to 'the hammering of so many tinkers at work,' and the noise of the charge was soon mingled with the groans and shouts of the combatants. It was not long, however, before the masses of Frenchmen in the scrimmage were borne down and forced across the ridge by the red-coated Guardsmen. All along the flanks and rear the cuirassiers began to gallop wildly from the field, while the main body was pressed down the ascent to the plain beyond La Haye Sainte. The Second Life Guards rode obliquely through the cuirassiers, who had been checked by the unexpected obstacle of a hidden hollow way (the '*chemin creux*' of Victor Hugo) cut in the ridge where the cross or '*verd cocou*' road left the main Brussels road. The Frenchmen sought to regain the high ground, but were pursued by the Life Guards, who came upon them at full speed and compelled a number of the French cavalry to return and seek concealment in the hollow way, in the hope of escaping to the main road. The Second Life Guards, however, pursued them so hotly as to be themselves thrown into some confusion by the broken nature of the ground.

It was when the combatants reached La Haye Sainte that Corporal Shaw distinguished himself in a desperate hand-to-hand contest on the level ground adjoining the farmhouse.

Siborne, the official historian of the Waterloo campaign, tells us that Shaw alone slew nine of the cuirassiers in this charge, and there are preserved a number of detailed accounts of his prowess, given by eye-witnesses. On one occasion, mentioned by Sir Evelyn Wood, he was seen to ride straight at a cuirassier who had taken up a position at the junction of the two roads. The Frenchman with his long sword thrust strongly at Shaw below the belt, but his thrust was swiftly parried, and the Life Guardsman's sabre crashed through the Frenchman's helmet, splitting his skull to the chin. In the words of the eye-witness, his face 'fell off like a bit of apple.' At one point two of Shaw's comrades, Dakin and Hodgin, saw him attack the standard-bearer of the cuirassiers, and after a short encounter slay him. When, however, he was about to seize the eagle, he was surrounded by an overwhelming number of the enemy, and lost sight of the trophy in the mêlée.

Captain Gronow, in his well-known *Reminiscences*, tells how, at a later stage of this first charge, Shaw again distinguished himself by saving the life of an officer of the First Life Guards.

Having overthrown Roussell's cavalry division, the Guardsmen of the different regiments followed in pursuit, and the British corps had become intermingled. Many of them, in their ardour, had reached the summit of the position occupied by the French, when Napoleon ordered several regiments of cuirassiers and Polish lancers to intercept their retreat by taking possession of the low ground lying between the two opposing armies. Captain Kelly of the First Guards had, with a few men of his regiment, reached the Grand Battery collected by Napoleon in support of his attack, when he noticed the swift approach of the fresh cavalry, and, rallying his men, determined to cut his way back to the British lines. At this moment Corporal Shaw hastened to the assistance of Captain Kelly, and the two, riding side by side, headed the returning troopers, and, in the words of a spectator, 'cut down their antagonists as if the latter had been poppies.'

In the retreat Shaw was now opposed by a giant cuirassier in armour. In order to successfully defend himself, he selected the vulnerable part of the opponent, and, parrying his lunge, slew him with a thrust in the neck.

When the remains of the regiment reassembled on the ridges, the heavy losses they had sustained became apparent. Shaw found that the two files which in the morning had stood on each side of him had been slain. He was himself wounded, but refused to leave the ranks.

For two hours afterwards the Guards remained in position inactive under a heavy cannonade. In his official despatch, Marshal Blücher declares that the decisive moment in the battle occurred at half-

past four; and Baron Von Müffling, the Prussian Commissioner on Lord Wellington's staff, states emphatically in his *History* of the campaign that up to that moment the battle had been 'bloody enough, but in no wise dangerous for the English army.' He adds, 'There was absolutely nothing to fear,' and then goes on to state that 'the position was really more favourable than would appear to Wellington,' and that 'from that moment the battle was considered as gained' (p. 28). The Prussian troops which had been promised to Wellington for the forenoon of the 18th now showed themselves, so that by half-past four (Blücher's 'decisive moment') two brigades of Bülow's corps had appeared before Planchenoit; but, although Sir Evelyn Wood points out that it was after five o'clock before the Prussian cavalry approached the British left wing, Wellington never considered it necessary to call up his reserve of eighteen thousand men stationed between Tubige and Hal, eight miles off. Wellington's understanding with Blücher had been for the assistance of only three thousand men and from a greater distance. It cannot be admitted that the arrival of this party saved the British army from destruction (as recently claimed by the German Emperor in direct contradiction of the Prussian officers who were engaged in the struggle), and the later events of the day confirm this, for the British had repulsed and driven off the Old Guard and the whole French divisions of the left wing by eight o'clock, while the Prussians were still engaged on their first point of attack at Planchenoit.

It is true that the German Legion, who occupied La Haye Sainte (and to whose bravery the British writers have done honour), lost the position assigned to them, which had to be retaken by a British line regiment. Unfortunately, also, the King's German Legion, being ordered to deploy by the Prince of Orange, had its flag captured by the French Chasseurs of the Guard, and it was not recovered; but that no reflection can rest upon the British troops in this connection is proved by Houssaye, the latest French writer. There is something grim and sardonic in the fact that the Kaiser should tell the soldiers at Hanover that their countrymen saved the British army from destruction, when we remember that it was the cavalry of Hanover (the Duke of Cumberland's Hussars) which turned tail and fled in disorder to Brussels when ordered by Wellington to move forward to support the British line.

After four o'clock Napoleon, noticing the advance of the Prussian troops, devolved upon Ney the duty of making a second attack upon the allied position, while he himself directed operations upon his right for the defence of Planchenoit against the new assailants. The French cavalry, led by Ney, approached the British position in three great lines, forty-three squadrons in all (four thousand five hundred horsemen), and soon reached the crest of the ridge where the British batteries lay. There however, they were met by a tremendous fire, which caused numerous losses; but the cuirassiers rode gallantly forward to the charge, shouting, '*Vive l'Empereur!*' and '*Victoire!*' They were received at thirty paces with a withering fire from the squares, and were broken up into a disorganised mass, which swept round the squares without charging home. Lord Edward Somerset used this opportune moment for making another advance with the Guards brigade, who, after a very slight resistance from the French cavalry, drove them in confusion into the hollow between the armies, whence after a time they renewed the attack, only, however, to be foiled again. In this way the French cavalry became thoroughly exhausted. Supports were sent for, which were seen moving forward with great apparent determination. Again the diminished squadrons of British cavalry fell upon the advancing troops and sent them headlong to the rear. Undismayed by these successive defeats, Ney sent for further reinforcements, and obtained thirty-seven squadrons of fresh horsemen, drawn from Kellerman's corps and the heavy cavalry of the Imperial Guards, and then advanced at the head of eighty squadrons to a final attack upon the British right. The reader must be referred to the brilliant pages of Siborne's *History* and Sir Evelyn Wood's *Cavalry in the Waterloo Campaign* for details of these successive attacks. Victor Hugo says: 'There were a dozen assaults. Ney had four horses killed under him. Half the cuirassiers fell on the plateau. The conflict lasted two hours.' It ended in the total rout of the Frenchmen. The British squares stood fast, though decimated. Ney, perspiring, his eyes aflame, foaming at the mouth, with uniform unbuttoned, and one of his epaulets cut off, saw the broken regiments returning in complete disorganisation to the French lines.

In these encounters Shaw and his comrades had taken a glorious part, and many are the thrilling accounts left to us of the deeds of the troopers in his brigade. We must, however, restrict ourselves to the narrative of Shaw's last charge. He had distinguished himself throughout the day, and now, when the British cavalry swept forward and rode through the remains of the French squadrons, Shaw still bore a prominent part, till in the last mêlée on the level ground to the east of La Haye Sainte he found himself cut off from his companions and surrounded by overwhelming numbers of the foe. The contest was a long one, and it was only when his sword had been broken in his hand that Shaw's defence was overcome. Hurling the hilt of his weapon among the enemy, he tore off his helmet and struck out right and left with it; but the swords of the cuirassiers ultimately cut him down, and he was left for dead on the ground. Victor Hugo tells us that as Shaw lay on the ground a French drummer-boy gave him the *coup de grâce*. That night a comrade, wounded like himself, had taken refuge near one of the houses which line the Charleroi road, and there he found Shaw. Our

hero, after being rendered unconscious by the numerous wounds which he had received, had crept in pain from the open ground to the protection of the farm-buildings which we know as La Belle Alliance. 'Shaw was almost cut to pieces and scarcely able to move.' On recognising the other as a comrade, Shaw was only able to whisper, 'My dear fellow, I am done for,' and then fell back from sheer exhaustion. When morning broke his companion found him lying dead, with his face resting on his hand, and having the appearance of having passed away while in a state of insensibility. His death was occasioned rather by the loss of blood from a variety of wounds than from the magnitude of any one. So was ended the career of the best swordsman in the British army, after giving striking evidence of his heroism and skill, the memory of which still lives in the ranks of his regiment. The visitor to Waterloo will experience little difficulty in discovering the small stretch of level ground where Shaw was overwhelmed by the superior number of the enemy, and the buildings of La Belle Alliance remain, after the lapse of nearly a century, in a state of wonderful preservation; the only evidence of the titanic struggle being the cannon-ball which rests embedded in the brick wall above the doorway, where it is discernible with difficulty, the proprietor having recently painted over the building, and having thus almost obliterated this interesting relic. It may well be that the cheers which were raised on all sides when Lord Wellington met Marshal Blücher on this spot at the close of the day may have served to attract the wounded Guardsman towards them, and roused him to make that final and supreme effort to reach the shelter of the building where he died. Long ere this Wellington had ridden off to the village of Waterloo to pen his famous despatch, written while his heart throbbed with emotion at the loss of so many of his veteran comrades in arms, and Blücher had started in pursuit of Napoleon and his retreating legions, now fast becoming a disorganised rabble. As darkness fell over the stricken field, the remnants of the two brigades of British heavy cavalry were drawn up within a stone's-throw of our dying trooper, at the spot where the Prussians entered on the pursuit.

Of the seven magnificent regiments, the Guards and the Union Brigade, numbering nineteen hundred swords, only fifty files remained. As already indicated, Corporal Shaw left a widow; but, as the young wife had not been enrolled on the register of the regiment, the claims of her child and herself could not be recognised, and she was compelled to find a home with her parents. It is satisfactory to know that a suitable memorial has within recent times been erected in honour of John Shaw at his native village of Cossall, Nottinghamshire. When Thomas Wheately, of the same place, died in June 1875, his countrymen remembered that both had fought side by side at Waterloo, and that no memorial existed to the hero who had so long retained their admiration, and no time was lost in repairing the oversight.

And can the brave whose blood had bought
This mighty triumph be forgot?
No! He who battled there and fell
Needs not the line of cumbrous swell.
This epitaph enough shall tell:
He died at Waterloo.

THE RIVER OF MY LOVE.

I STAND and gaze on the St Lawrence stream:
She fills her mighty channel with her flow,
She holds on her fair breast the May-day gleam,
Her surface ripples as the west winds blow;

She bears her burden of deep-laden ships
As toys upon her bosom, unaware;
She sweeps towards the sea, whose salt, white lips
Curl as they meet hers in the bridal air.

Yet not like her the river of my love—
The little one, whose waters shrink and grow,
Threading their way in silvery dance above
The pebbles that the netted sunbeams show.

What myriad charms meet in her primrose dells!
Hers are the ways that gentle hearts allure;
She sings her maiden song 'mid heather-bells,
For she is laureate of the scented moor.

The restless curlew croons above her flow,
The lark inweaves his music with her own;
She brightens in the mellow evenglow,
While a lone dipper curtsies on a stone.

Down from the breezy slopes her path she takes,
Loitering along by many a mossy well,
Where builds the wren and where warm moisture makes
Soft nooks where butterwort and sundew dwell.

The brooding pheasants by her margin sit;
Above her shouts the cuckoo in the firs,
And spotted moths of blue and silver flit
About her borders, where the junipers

Smoke in the welcome airs that lightly sway
Each bush and branch in odorous delight,
Shared by the rock-rose and the orchis gay,
Whence the swift snipe begins his sinuous flight.

For love of her the yellow broom hard by
Makes with rich clusters many a golden arch,
Through which her waters glide with answering sigh
To where, like sentinel, stands the tasselled larch.

So, onward still, through many a hazel brake,
Wanton her waters on their winsome way;
'Tis sunshine in the soul her gambols make,
The sportive darling of the summer day!

And all her pilgrimage to the waiting sea
Is flecked with change—freshet and fall and pool.
She takes earth's broken surface laughingly;
Each varying day with visions sweet is full.

Ah! count my rhyme an idle one, yet I
Will sing of what leaves imprint on the heart.
I court no distant grandeur: it is nigh,
The theme that tempts my unaspiring art.

To both the poet's tribute well belongs:
The vast St Lawrence pride and wonder stirs,
Her waves are worthy of a thousand songs;
But the home-streamlet—all my love is hers!

VARIABLE STARS.

By ALEXANDER W. ROBERTS, D.Sc., Lovedale, South Africa.

ALL down the ages the stars have been regarded by thoughtful men as the type of nature in its unvarying moods and manifestations. On this earth of ours we find, everywhere and always, an unceasing ebb and flow of the tide of human affairs: birth and death, growth and decay. Men come and go; empires rise and fall; even civilisations dawn, culminate, and set; but amid all these changes the stars in their high heaven shine on, seemingly untouched by decay and unaltered by the effacing hand of time. They, to all appearance, change not with the changing years. Unmoved, as if their foundations rested on eternity, the 'fixed' stars keep their appointed places, while their brightness grows not dim with the passing of man's centuries. The sky shares with the sea and the great mountains the charm of perpetual youth; and this is why the hearts of men are irresistibly drawn out to the hills and the seas and the stars.

Yet, after all, this seeming fixity of place, this apparent constancy of light, is far, very far, from being an actual reality. The stars, in common with all created things, come within the grip of the universal laws of growth, development, and decay. Instead of fixity, therefore, there is movement of the most stupendous nature; instead of constancy, there are changes of such magnitude that we have nothing on earth to which we can liken them. Most of these changes and movements, however, take such long periods to unfold, because of the distance and size of the stars, that in the lifetime of a man, or even of a nation, the face of the sky, like the outline of some majestic range of mountains or the shores of a vast ocean, bears ever the same appearance. But in the lapse of long ages the shores of the ocean alter, the outlines of the mountains change, and the stars vary in brightness and colour and position.

To follow out our analogy yet a little further: just as the surface of the sea and the slopes of the mountains, while preserving the same unvarying aspect as a whole, yet in their parts—their waves and their slopes, their reaches and their valleys, the sheen of their waters and the brightness of their foliage—change with the days and the seasons, so the heavens as a whole ever present to earth the same majestic formations; yet not a few of the stars that go to make up this seeming unchanging whole vary in brightness so rapidly and so orderly that even in the brief span of a man's life we are able to ascertain the laws which regulate their variation.

I think a simple illustration will make this clearer. I have often pictured to myself the thoughts and feelings of some ancient astronomer, say one who lived in the days of Abraham or Job, if he were to return for a brief season to this time-fretted earth of ours and find himself once more in the stream of earthly concerns. What perplexity, what amazement, what curiosity would be his as he wandered up and down, up and down, the busy streets of even a slowly changing Eastern city! How much would be new to him, how much would be strange and perplexing: steamers and trains, telegraphs and telephones, tram-cars and motor-cars! But I can best of all imagine his excited wonder and eager curiosity as he passes within the portals or stands beneath the mammoth dome of one of our modern observatories.

'What is this: a place for observing the stars, say you? And this huge engine: a telescope do you call it? I also, in that far-off yesterday when I sojourned on this earth, possessed an observatory; but it was not at all like this. It was only the flat roof of a lofty tower near the wall of the great city of Nineveh; but it was the finest observatory in all the East, and men came from far and near to view the pictures of the sky that I drew on my clay tablets. So much has changed since that day that I suppose the stars I used to observe four thousand years ago will all have passed away. Alas! I am indeed a stranger in a strange land.'

And now the day draws to a close and the night

[*All Rights Reserved.*]

gathers in. Soon the darkness shrouds from sight all that men had wrought and accomplished during the centuries. Slowly one by one the stars creep forth: great Orion and the Northern Bear, Sirius and Aldebaran, the Hyades and Pleiades, Vega and Arcturus.

As their light shines forth on the darkening world the feeling of strangeness and sadness passes away from our visitor, for there above him are the same stars that he used to watch and chart ages ago. How often had he seen them rise from out the Eastern haze or set behind the Syrian hills! The world might have changed, had indeed changed, but here was an unchanging canopy of glorious light.

And thus the centuries roll away, and in imagination he is back once more in his lonely watch-tower by the city wall; once more he is eagerly scanning the face of the sky and comparing it with those pictures he drew forty centuries ago. Forty centuries? Surely not, for the stars are just the same as they were when he lived and watched and prayed under them.

Yet stay! Not quite the same: surely Sirius was redder then than it is now? And the Pleiades look different. Were there not seven stars? Can one be lost? It must be, since now there are only six. And then, over there to the south, in the Scorpion, is a bright star he never remembers having seen before. When and how did it come into existence? He must return another night and more carefully examine the face of the sky; for, while the general features are the same, here and there he has discovered distinct evidences of change, whether changes indicating coming age or growing manhood he is unable to say. And so he comes to our modern observatory night after night, and each succeeding evening he lights on objects which were unknown to him in his Nineveh days: stars which have sprung into existence somehow and sometime during the passing of the centuries. Then, again, he searches in vain for many an old friend. The lost Pleiad is only one of many whom darkness or decay or destruction of some kind has overtaken. One day the mystery of stellar variation and change so oppresses the soul of our visitor that he returns no more to carry on his investigations. And this is the last we know of him.

Now let us leave our parable and concern ourselves with actual history, which, after all, is not so very different from what we have in imagination set forth.

When the father of astronomy, Hipparchus (B.C. 130), compared his maps of the sky, or rather his catalogue of the brightest stars, with those made centuries before his day, he was convinced of the occurrence of changes in the position and brightness of the stars. Indeed, during his own lifetime one bright star suddenly appeared in the constellation of the Scorpion, and then slowly faded away again.

It was the desire to provide material for the detection of phenomena so rare and striking as the sudden appearance of new stars or the disappearance of old ones that led one astronomer after another to draw up catalogues or make charts of the stars. And their labours were not fruitless, for between Hipparchus's day and the beginning of the sixteenth century four new or temporary stars were discovered. If, as some writers urge, we include the star of Bethlehem also as an appearance of a beautiful and brilliant temporary star, this would be five such remarkable occurrences in the period lying between the rise of ancient and the birth of modern astronomy.

Since the discovery of the telescope and the multiplication of observatories all over the globe, the number of new stars detected has slightly increased. It is, indeed, scarcely possible now for one to escape the meshes of the photographic net set for its capture in many a corner of the world, and thus scarcely a year passes without one more being added to the number already known. These stars are of the same character as and are probably due to the same causes which brought into existence the famous star that recently blazed out in the constellation Perseus, a description of which has already appeared in the pages of this *Journal* (1903, vol. vi., No. 264).

It is impossible to predict when or where a new star will appear, just as it is impossible to tell when or where a boiler explosion will take place in Glasgow. And when one does appear, it is equally impossible to say what its life-history will be. It may remain bright for months, or may swiftly fade away into the darkness whence it came. It may have secondary outbursts of brightness, like that of the well-known southern star Eta Argus, blazing up again and again, as if some giant hand were stirring at intervals the vast stellar fires. Or it may decrease steadily in light for months, and then, in a fit of seeming sulkiness, suddenly stop waning. There is no telling what new stars may do. They are erratic in their coming and going, but like all erratic things, they are always interesting.

Mankind had been on the watch for new stars or had been carefully observing old stars for nearly two thousand years before they lighted on a second and even more wonderful class of variable stars.

As the sixteenth century was drawing to a close one Fabricius noticed that a certain star in the Whale fluctuated considerably in brightness. At certain times the star was a conspicuous object in the sky; at other times it was quite invisible. He watched its variation for some years, and then other astronomers took up the tale. Now we know that Mira—or the wonderful, as this variable star is called—goes through a whole cycle of light-changes in three hundred and thirty-two days. Up and down, up and down, down more slowly than up, it pulsates throughout the ages. Whence this rhythmic change of light? What cyclopean monster can be stoking the fires of this immense orb?

The question is of supreme interest, for there are over three hundred stars of the same type as Mira

known to astronomers. But before we deal with the 'why' of the variation of such stars, let us consider for a moment the manner and the character of their light-changes.

We have used the words 'of the same type as Mira.' What are the peculiar marks of this type? One is that with the great majority of these stars—stars like Mira—a full period of variation is completed in about one year; a second feature is that their colour is always red; and yet a third feature is that their range of variation is very great and frequently irregular. Take, for instance, the star Mira. At its maximum brightness the light of this variable star is at least one thousand times greater than the amount of light it gives forth at its minimum phase. And Mira is not a solitary example of a range so considerable. There is in the southern sky a star whose increase in brightness from minimum to maximum is no less than ten thousandfold. Other similar instances could readily be brought forward.

Now, here we are face to face with a supreme difficulty. If Mira once or twice blazed up a thousandfold, and then, exhausted, went out in darkness, we could understand the phenomenon. We should be witnessing simply a celestial conflagration. But here we have a star (and, as we have said, there are hundreds of the same type) that periodically, with the regularity of the returning seasons, gets into a frenzy of light and heat, and is afterwards apparently none the worse for its outbursts. At any rate, it has been going on in this extraordinary way, probably for ages, without anything happening that would indicate a final catastrophe.

Many explanations will at once arise in the mind; some of these can be set aside without argument. No part of the variation of stars of this type is caused by eclipse. The revolution of a body partly bright and partly dark is also out of the question. Imagine a star with one hemisphere one thousand times brighter than the other!

What about chemical change? Any chemical change which would produce an increase of light anything like that which takes place on Mira would mean also the disintegration of the star.

Perhaps the primal cause of the variation of the peculiar type that we find in Mira and its congeners has its origin in electrical disturbance similar to the rhythmical discharges which produce the aurora and perhaps also the sun's corona.

But it is as well to be honest in the matter, and to confess that we know next to nothing of the cause or causes which lie behind long-period variation. We know the effects, for we can see them, measure them, classify them; but that which lies behind the things seen is beyond our ken, at least with our present means of research. We must content ourselves with the visible facts of variation of the type of Mira and leave the question of cause to a future day.

The eighteenth century was well on to a close before the first star of the third type of variation was discovered. This third type is usually known as 'short-period variation,' just as stars belonging to the previous or second class are called 'long-period variables.' As the name indicates, stars belonging to the 'short-period' class vary in a short period, usually a few days, sometimes a few hours. There is a southern variable, for instance, which completes its cycle of light-changes in seven hours. The range of variation in stars of this type is always small, and the period very regular.

One of the most important advances of late years in this branch of astronomy, sometimes called astrophysics, has been the discovery that many, if not all, of the stars of the short-period type are double—that is, each short-period variable is composed of two stars; and its variation is somehow connected with its binary character.

The thought at once arises that the variation is due naturally to the eclipse of one component by the other. The character, however, of the light-changes of stars of the third class indicates indubitably that their variation is not due to eclipse but to tidal action of some kind. Probably the revolution of one star round the other produces stellar tides; and these vast upheavals of liquid or gaseous matter generate sufficient heat to give to the light of the star a variable character. This is the explanation of short-period variation which most commends itself to those who follow out this special branch of astronomy, and it seems to the writer both an efficient and sufficient theory.

It may be said here that the stars belonging to this third class are fewer in number than those belonging to the second class, probably because their narrow range of variation makes them more difficult objects to discover. About one hundred are known to astronomers. This number, however, is steadily increasing as the accuracy with which observations of light-changes are made becomes improved.

Perhaps the most interesting class of variable stars is the fourth class—interesting because we know what causes their variation, and still more interesting because of the direction and the distance that this knowledge has already brought us.

Stars of the fourth class are more commonly called Algol variables, because of the famous star Algol, the first in point of discovery and first in importance of all stars of this type. It needs no refined appliances to obtain a great deal of knowledge concerning these stars, for Algol is bright enough to be seen by the naked eye, and even untrained vision can follow its light-changes. Every good almanac also duly sets forth the times and seasons of its eclipse. Almost every text-book in astronomy also declares the manner and nature of its light-changes, so that if any one is in ignorance of the behaviour of an Algol star it is not through lack of opportunity of obtaining knowledge on the matter.

There is in almost all stars of this class a constant period during which the star remains invariable in brightness. Then sets in a period of rapidly decreasing light, followed by an equally rapid rise to

the star's normal brightness. No comparison occurs to me more illustrative of Algol variation than the winking, winking, winking light on some dangerous headland; only in the case of the lighthouse the obscuration takes place every minute and lasts one or two seconds, while in the case of an Algol variable the eclipse occurs every two or three days and lasts some hours. The eclipse! Here we have the secret of Algol variation. All stars of this class are double, and the sudden change in their brightness is caused by one coming in front of the other.

Modern astronomy has deduced a number of interesting conclusions from the manner in which stars of this class vary in brightness; or, to put the matter otherwise, from the way in which one of the companions of an Algol system shuts off all or part of the light of its fellow, we may arrive at a number of very important deductions. We may, for example, frequently determine the size of the two stars, their nearness to one another, their density, their weight, their shape. Consider what all this means; consider what a wide field of research it opens up. And, above all, there is this of interest circling round Algol stars: we are not dealing with old, decrepit, worn-out worlds and systems; we are dealing with worlds newly born. When we observe an Algol variable we are looking on a star in its cradle, for, astronomically speaking, it was only but yesterday that the system divided into the two stars which compose it. Indeed, with regard to three such stars, division has scarcely yet taken place, and the two masses are for all the world like two pears joined point to point.

We might add a fifth class of variable stars, and push into it every changing star that will not fall readily into line with one or other of the four distinctly marked types described in this paper. Into this class many observers would thrust the great bulk of stars; for not a few careful and cautious inquirers urge that almost every star in the sky is more or less variable.

But since the sun is also a star, what about its light? Is the brightness of the sun variable like that of the inconstant moon, though to an infinitely less marked extent? There is abundant evidence that the sun's light is not constant; and probably when we have got behind the secret of its variation we shall also have got behind the secret of droughts and blizzards and magnetic storms.

At the beginning of this paper we touched on the idea of the whole creation of stars passing through vast secular changes; but the conception of such a thought, not to speak of observations even remotely bearing on so profound a matter, is beyond our finite minds. At least we could only vaguely theorise on the subject, and that is not profitable.

It is exceedingly remarkable that the bulk of our knowledge of stellar variation has been gained for us by men with little means and less leisure. I do not think it is sufficiently known that no town can claim to its credit so great a number of variable stars as the old gray capital of Scotland. And the observer who has made all these discoveries has done so with a telescope as long as one's arm, and in an observatory the dome of which is a street window!

There is no section of modern astronomy which holds out more promise of success to the amateur observer than the subject of variable stars. A small telescope or even none (Heis, one of the greatest authorities on the subject, used his unaided eyes), a good star atlas (failing the possession of this, let the observer make one for himself), and an unpretentious catalogue of stars are all that is needed to carry on the highest work and the most recondite research on variable stars.

GIANT CIRCUMSTANCE.

CHAPTER XVI.—CONCERNING THE GIRL.

LD Donald Cameron and the stranger were going over the house together.

'I strayed into a glen at the foot of the loch among the hills, Mr Cameron, and met a young lady there with a black-and-tan collie. Can you tell me who she is?'

'Oo ay! 'Twould be Miss Lesley mebbe,' said old Donald, as though girls such as that were as plentiful as blaeberries.

'And who is Miss Lesley? Does she live hereabouts?'

'She iss stopping with her mither in a small hoose out beyant,' said Donald, with a sidelong jerk of the head which comprehended one full quarter of the Eastern Hemisphere.

'I see. She's just on a visit.'

'Juist that;' and you would never have thought from the looks of him that Donald was, if not quite lying, distinctly Ananiasing the truth.

His appearance commended him as a man to be trusted. He was well on in years, his hair was white, and he looked eminently respectable. In his plaid and tam he looked also decidedly picturesque, like an old Covenanter or a bit out of Burns or Walter Scott, Geoff thought. In manner he was restrained and uncommunicative to the point of taciturnity, racial characteristics emphasised by his remembrance of an interview between himself and the young lady with the collie on the previous day.

Old Donald had gone across to the small house 'out beyant' with the information that the accursed Southerner who had bought the island was coming to visit his new possessions.

'Very well, Donald Cameron, you will understand that we wish nothing to do with him—nothing what-

ever. And if he should by chance come across us, and ask you who we are, you will tell him nothing about us. You understand, Donald Cameron?'

'I unterstant, Miss Lesley. And what iss it I will say if he asks me?'

'Oh! say anything. Say we are just stopping here for a short time.'

'Aw! And will I say that now, Miss Lesley?'

'Yes, you will say that, for it is quite true. I have trusted you all my life, Donald Cameron; but if you do not do this that I ask you I will never trust you any more as long as I live.'

'Aw, Miss Lesley!' and the old man, who looked like a pillar of the Church, went away considering the most effective style of dust for prying eyes in case of need.

The stranger, however, whatever he may have felt, showed no disposition towards undue prying. His present stay was to be so short that it permitted of nothing more than a fleeting bird's-eye view of things in general. He would make closer acquaintance with men and matters later on. The question he had put had been a most natural one, and apparently the answer had satisfied him.

He strolled through his new house with interest. He had bought it all just as it stood, and he found it much to his liking. The furniture was not very modern, but it was solid and in keeping with the house. The portraits on the walls saddened him somewhat, as evidence of the utter breakdown of the House's fortunes. He knew nothing of the circumstances of the case beyond the fact that the late owner was dead; that his name, in common apparently with all the other inhabitants of the island, was Cameron; and that he had come to financial grief.

'Is the late Mr Cameron among them?' he asked as he glanced over the dark-faced portraits, brave in bonnets and brooches and tartans.

'He iss not,' said old Donald.

'How did it all come about? I have heard nothing. It is rather saddening, you know. Is there any family left—any sons?'

'Not a one. He juist went spekilating in things he did not unterstant, and he lost himself and all he hat, as many another hass done before him.'

'Ay, it's a ruinous game,' said Carrick. 'Can you have some one to live in the house all the time, Mr Cameron? Just to keep it warm, you know, in case I want to run up at any time. An empty house is always dismal, and when it's shut up it takes weeks to get right again.'

'I can do that. Will ye no' be coming to live here yourself?'

'Not yet. Perhaps not for some time. You see, I'm in the army, and I may be ordered away.'

'Ay?' said old Donald thoughtfully.

Carrick remained there two days; but as they happened to be very wet days, and he had come up in lightest marching order, he never left his own particular crag of an island, and saw no one but old Donald and his wife, who only bent herself in an old-fashioned, frigid obeisance when introduced to him, and seemed even less loquacious than her husband.

He did not even cross the island again on his way back. For old Donald suggested the saving of a wet walk by going round in the boat, which he asserted he had to do in any case for some stores.

So Carrick drank deep of the delights of solitude for those two days, and did not find them long. He searched for books, but found very few, and those of no interest to him, and so concluded that his predecessor had probably found his enjoyments in other directions; though what he could possibly have done in the long winter nights passed his comprehension.

From the tower windows he watched the rain-clouds come sweeping in from the sea till, as they reached the mouth of the loch, they blotted out the headlands and the shores, and left him face to face with the mighty void of the Atlantic. He watched them drift like a swaying gray curtain along the hillsides, and saw once more the bristling ridges start up from their sleep and stand out in strange relief as the curtain drew silently away up the corries behind.

Once, when the sun struggled briefly through the broken clouds on the second day, the loch was full of rainbows—an amazingly beautiful sight. He counted no less than seven at once, some complete, and some lying like great broken butterflies along the hillsides, changing their natural greens and browns and yellows and grays in the most extraordinary fashion.

It was all very wonderful and very delightful, and when he thought of the dust and sand and skin-cracking heat of the Soudan, it was more delightful still.

But, through all the kaleidoscopic changes of mist and rain and rainbows, one thing surprised and half-provoked him. Whether he stood gazing into the soft gray wall that hid America, or watched his own hills take surprising new shapes under the kiss of the mists, or sat looking into the crumbling peats through the smoke of his pipe, to the tune of the breaking waves below and the sighing of the wind past his turret—after a while, on soft gray wall, or starting hillside, or glowing cavern, there looked forth at him a pair of large dark eyes filled with scorn and detestation and affront, and much more besides, in a lovely, high, proud face which endorsed and accentuated all that the dark eyes said.

'Hang the girl! Why does she go on kicking me like this?' he said to himself more than once. For he knew as well as if she had told him so, that whenever she thought of him, she thought of him just as she had looked at him—as if she would like to put one of her neat little brogues on him and crush him out of existence.

However, it was no use worrying about her. She would be away before he came back, and it was not at all likely they would ever meet again.

The third morning broke into smiles, like a coquettish maiden at the departure of her lover in order to rivet his chains the tighter. It was a very pearl

of a morning. Sun and sea and sky and hills all gleamed and sparkled the brighter for their washing. Never had Carrick been so sorely tempted to fling duty to the winds and stay on despite the consequences. But old Donald was already on board the little workaday cutter that belonged to the house, shaking out the sails, baling out the intake of the two days' rain, and mopping up the seats. And presently he brought her round with a graceful sweep to the rough stone pier, and Carrick stepped on board and was on his way to London.

It was a delightful run in the bracing north-easter. The sky was blue; the sea was bluer, with crisp white fringes to its dancing waves; the crowding trees held endless shades of greens and browns and yellows, with stiff belts of pines and firs every here and there, black-green and gray, feathery on distant heights, grim and sombre in the unsunned glens and corries, but always to Carrick's eye suggestive of serried ranks of armed men. The bracken, from sea-level, lay in slabs of dark bronze-green above and tawny-bronze below, and the rich purple bands of heather along the higher slopes smiled radiantly in the sunshine. And up, up, up into the clear blue sky soared the great mountain-peaks, shining still with the rain, laced with falling waters, calm, serene, and grand, and—his.

As they sped out of the loch, to gain an offing and keep the wind, he waved a regretful, jubilant hand to it all.

And one, watching cautiously, away along the hillside, drew hastily back with an angry flush and a murmured 'Insolent!'

But he had not seen her, and her anger was wasted.

To say he had not thought of her, however, would be very wide of the truth.

(To be continued.)

THE GRAMMARIAN OF YORK.

IT is now over a hundred years since a clever New York lawyer and merchant came to this country for the sake of his health, purchased a small property at Holdgate, a suburb of York, and remained there for the rest of his life, a period of forty years. He had made a modest competency, and could live at the rate of about five or six hundred pounds a year—which was fortunate, as he was a confirmed invalid. An affection of the muscles prevented him from using his limbs. At first Lindley Murray, the future grammarian and school-book editor, could take a small amount of exercise in his garden or farther afield in a bath-chair, but afterwards only in his carriage, to which he ascended on a plank extended from his garden-gate to the carriage-door. Even that ceased, and for the last sixteen years of his life most of the grammarian's time was spent seated on the sofa which had been his couch on the voyage from America, in a comfortable, well-ventilated drawing-room, where, summer and winter, the atmosphere was kept at a temperature of over sixty degrees. Neither open windows nor draughts agreed with him, medicine he had luckily forsworn, and the only mitigation to his muscular pains came when gentle rubbing was exercised on the parts affected, a system adopted and recommended in modern times as massage. Fortunately, his mind was clear, vigorous, and active, and sight and hearing and memory were preserved to him until his death at the venerable age of eighty-one years.

Lindley Murray's life falls into two equal parts: the first forty years were spent in the United States, where he was born; the second forty in England. The eldest of the twelve sons of a New York Quaker merchant, he survived them all, with ill-health into the bargain. He was born at Swetara, Pennsylvania, 22nd April 1745, and died at York in his eighty-first year, in 1826. His remains rest in the Friends' burying-ground at York. Writing of his school-life, he calls himself a 'heedless boy,' and as the result of severe chastisement from his father he once ran away from home. He infinitely preferred science and literature to his father's counting-house; and after a short experience there he studied law, was called to the Bar, and practised successfully as counsel and attorney in the province of New York. He retired on the outbreak of the War of Independence. The four years spent at Islip on Long Island, shooting and fishing and idling, he afterwards regretted. The severe illness which impaired his muscular power overtook him while residing at his own country-seat of Bellevue, on the Hudson. At the suggestion of his New York doctor he came to England at the end of 1784, and after visiting various towns in Yorkshire, settled at Holdgate, York, which he was never to leave. Thus we provided an asylum for a grammarian and school-book editor. Had any one prophesied this employment to Lindley Murray when an American citizen, doubtless he would have thought the suggestion due to a disordered imagination.

In character, Lindley Murray, like the other American lexicographers Noah Webster and Worcester, was retiring, modest, benevolent, and deeply religious. An affectionate wife and servants were devoted in their attentions; but how was a man of education, of more than average culture and intelligence, thus thrown upon his own resources, to spend his time and prevent himself from being a burden and a nuisance to those around him? Professor Finsen of Copenhagen, discoverer of the light-cure in disease, who died at forty-three, was even more a sufferer and an invalid than Lindley Murray, and could not move from his room, yet he did much for the amelioration of human suffer-

ing. R. L. Stevenson wrote on bravely at his literary tasks in all states of health. Like Samuel Smiles, who found the nucleus of his *Self-Help* volume in some addresses to a Midland literary society, Lindley Murray received his suggestion towards 'a rational and salutary employment' from without. Of Quaker persuasion, he was interested in a Quaker girls' school at York, and found that the assistant teachers were not sufficiently qualified for their task. Murray gave them some private instruction, and made extracts from Blair, Campbell, and other writers on their behalf. Teachers and superintendent alike requested Murray to prepare an English grammar for their benefit, which should be simple, clear, and well graduated. Murray, who had no pecuniary expectations, fell in with the suggestion at once, although he did not believe there would be any great sale for his book beyond a few schools in which he was interested. He wished to do good to others, and to youth particularly. His *Grammar* proved an enormous success when printed and published by Messrs Wilson and Sons of High Ousegate, York; and, as a writer in *Blackwood* for 1829 remarked, it 'reigns despotically through the young ladies' schools from the Orkneys to the Cornish Scillys.' Published in 1795, by 1826 one edition had been printed forty times. As ten thousand copies went to an edition, that meant a circulation of four hundred thousand copies, and the sale was being continued. In 1858 it was stated that the annual sale of the *Abridgment of the Grammar* in England had been about fifty thousand copies. In all likelihood this book achieved a sale of over two million copies before it was ousted by more modern books. This was followed by *Exercises*, *Key to Exercises*, an enlarged edition of the *Abridgment of the Grammar*, as well as spelling and reading books. There is no doubt that this quiet source of employment discovered by this famous invalid prolonged his life, as it also increased his usefulness.

Lindley Murray composed and wrote with quickness and facility. The first edition of his *Grammar* occupied him for a year; the *Exercises* and *Key* each took a like period. He does not seem to have made any lengthy preparation for the writing of his *Grammar;* he had a good education, knew Latin and French, and had some Greek. His amiable and intelligent wife proved an excellent guardian and helpmate. In summer he rose about seven. When he was dressed his wife wheeled him to the sofa in the sitting-room, where he sat during the whole day. His meals were served on a table placed before him. When he was at work a portable writing-desk was placed at hand, and his books and papers lay on the sofa close by. He never wished to go near a fire, and believed that the glare from the fire and candles was hurtful to sight. He did not smoke, and took no stimulants save perhaps a half-glass of wine or a gill of London porter at dinner. His breakfast and supper for years consisted of new milk and baked rice and toasted bread. This might be varied by chocolate boiled in milk and water, and bread. Dinner was severely plain but well cooked. Withal, he did not look like an invalid. His countenance was dark but ruddy, and beamed with benevolence; he was tall, well-proportioned, rather stout, with an open forehead, regular features, and a pleasing if not handsome profile. Such was Lindley Murray, than whom there could be no more estimable character, although his name as a grammarian may have become a byword. Those who wish to see the grammatical errors which he perpetrated may consult G. Washington Moon's *Bad English Exposed*, where forty-seven pages are devoted to our subject. 'Almost every kind of fault in composition,' says Moon, 'may be found in Lindley Murray's own writings; and yet I affirm he is not more inaccurate in his language than were ninety-nine men out of every hundred. He knew what was correct in the use of words, and effected much good in his day; but his practice was strangely at variance with his precept.' The Friends' Meeting, York, published a handsome tribute to his memory; and his friend Elizabeth Frank edited his autobiography (1826).

Some highly gifted men differ as to the necessity for learning grammar. Mandell Creighton, sometime Bishop of London, whose biography by his wife is one of the best books of last year, in presenting some school certificates in 1898, pleased the children immensely when he told them that if he had his own way he would abolish the teaching of grammar in schools. A grateful schoolboy wrote and thanked him, saying that grammar had been the bane of his life. When pulled up and asked what he meant, Creighton explained that he said this not because he did not like grammar, but because he thought it the subject farthest off from life. Boys left Board schools knowing nothing of grammar, which they had been carefully taught. 'You will not teach them to speak and write correctly by teaching grammar, but by making them talk and write, and then correcting them.' Mr H. M. Wattie, one of H.M. Inspectors of Schools, says there is no subject more difficult to teach than grammar; none which called more insistently for intelligence of method, and where the method was not intelligent there was no subject where the results are more disastrous. All the minutiæ of grammar were an attempt at least to express facts in the language which a careful study of the language must express in some form or another. Dalton the chemist said that of all the contrivances invented by human ingenuity for puzzling the brains of the young, Lindley Murray's *Grammar* is the worst. Others, more respectful, style Lindley Murray the Father of English Grammar; some think that the *English Grammar* of Robert Lowth (1762) was so freely drawn upon by Lindley Murray that he should have made a more handsome acknowledgment. He does, however, acknowledge indebtedness to Harris, Johnson, Lowth, Priestley, Beattie, Sheridan, Walker, and Coote. Lindley Murray evidently supplied a public demand, for the *Abridgment* alone, of the 1816

edition of the *Grammar*, went through more than one hundred and twenty editions of ten thousand each, or one million two hundred thousand copies. The profits of his literary labour Murray handed over mainly to the philanthropic objects in which he was interested. The printers and publishers must have reaped a rich reward, as he parted with the copyrights of his various works for only a nominal sum.

We are told by Miss Frank that he sold his copyrights to one of the first firms in London—we presume the Longmans. For the *Grammar*, *Exercises*, and *Key* he received seven hundred pounds; for the *Abridgment* one hundred pounds; *English Reader*, three hundred and fifty pounds; *Sequel*, two hundred pounds; *Introduction to English Reader*, two hundred pounds; two small French books, seven hundred pounds; *Spelling-Book* and *First Book for Children*, five hundred pounds; *Selections from Horne's Commentary on the Psalms*, one hundred pounds. The total amounted to nearly three thousand pounds. Murray was ably seconded by his printers, Wilson and Sons of York, in the production of the various books, which must have proved a gold-mine to local printers, and were never off the printing-press. Last year was the centenary of his *Spelling-Book*, in the production of which he was assisted by his biographer, Elizabeth Frank. In 1826, and for many years previously, every edition of the *Grammar* and *Exercises* and *Spelling-Book* had been ten thousand copies, and of the *Abridgment* also ten thousand copies. This may seem small in the light of twentieth century school-book production; but it was looked upon as a magnificent success some eighty years ago. How different the fate of Robert Browning's hero, described in 'A Grammarian's Funeral,' to be buried on a hill-top with his life-purpose unfulfilled:

> That low man seeks a little thing to do,
> Sees it and does it.
> That high man, with a great thing to pursue,
> Dies ere he knows it.
> . . . . . .
> So, with the throttling hands of death at strife,
> Ground he at grammar;
> Still, thro' the rattle, parts of speech were rife,
> While he could stammer.

Lindley Murray, after he handed over his New York business, first to his father to manage, and then to his brother John, and sought health in England, discovered a great open secret in the process that work into which you can throw your heart and soul is true happiness. Noah Webster (1758–1843) and Joseph Emerson Worcester (1784–1865), other two well-known American grammarians and lexicographers, knew the secret too. Webster's *Spelling-Book* must have kept a printing-machine going since it was produced, as over sixty-two million copies have been sold. The author supported himself and family for twenty years from its profits while he was at work on his great dictionary, although the royalty to him from the publishers was less than one cent a copy. Of the effect of literary work on mind and body, Lindley Murray says that he 'found that the mental exercise which accompanied these was not a little beneficial to my health. The motives which excited me to write, and the objects which I hoped to accomplish, were of a nature calculated to cheer the mind and to give the animal spirits a salutary impulse. I am persuaded that if I had suffered my time to pass away with little or no employment my health would have been still more impaired, my spirits depressed, and perhaps my life considerably shortened.' All of which is likely to be true, although possibly some of our grandfathers or grandmothers may have believed that studying his *Grammar*, if it did not abridge their lives, at least abridged their happiness. The correction and improvement of his various editions occupied him agreeably to the very close of his life. Murray meditated a 'purified' edition of the poets, which was never executed. His *Power of Religion on the Mind* and enlarged *Grammar* he presented as a free gift to his booksellers.

Let the educationists dismiss his *Grammar* or other works as they will with the silence of contempt or with eloquent scorn; Lindley Murray, if in some sense a torment to youth, was personally a true hero and a true Christian gentleman, and accomplished much in his day and generation, if we consider how handicapped he was in health and opportunity.

LIEUTENANT RADLERS HOLIDAY.

By DOROTHEA GERARD (Madame Longard de Longgarde), Author of *The Bridge of Life*, *Made of Money*, &c.

'BON *voyage!* and may Vienna be propitious to you!' said Lieutenant Bergl to Lieutenant Radler through the railway-carriage window.

'My compliments to the *Stefansthurm!*' cried another.

'And to the opera-house!'

'And to every stone in the capital!' laughed the traveller as he pulled up the window. 'All right. I'll give the messages faithfully.'

The train was moving already as he sank back into his corner, beaming all over his young, sunburnt face. And no wonder either, considering the circumstances. Exile in a distant east Galician station, in which such things as theatres and ball-rooms were equally unheard of, had been his lot for two years past—an uninterrupted exile, too, since

empty pockets render even furloughs futile, and Lieutenant Radler's pockets were chronically empty.

It was to a certain chestnut mare that he owed his present prospects. The German horse-dealer who had turned up last week at Hamienow appeared to the impecunious hussar to have dropped straight from heaven, hooked nose and all. Now, as he sat in the Vienna express, with six hundred florins in crisp bank-notes, as well as his two months' leave of absence, in his pocket, he did not know whom to bless more fervently—Suleika or Herr Kornberger.

What a time he was going to have of it!—the only difficulty being to decide whether the ballet or the Orpheum, the night cafés or the public balls, were to enjoy the most of his patronage; and with never a single stupid recruit or a solitary ill-strapped saddle to try his temper.

In all the long train there was probably no lighter heart than the one with which Lieutenant Radler at length fell asleep to dream of electrically lighted rooms and rose-coloured skirts.

When he awoke the gray morning light peered in at the carriage window, together with the snow-flakes that beat against it; for although March was waning, the Polish winter still reigned supreme; and, despite eight hours' travel, they were not yet over the Galician frontier.

Cramped and chilled, the lieutenant pulled himself together. At the wayside station where they had just halted a very welcome cup of coffee might perhaps be attainable. Still almost half-asleep, he opened the door of the compartment and precipitately descended—far more precipitately, in fact, than he had any intention of doing, for the frost-coated step, only dimly visible in the dawning light, was as smooth as glass, and within the same moment of touching it with his foot he found himself lying full-length upon the ground, hurled there, as it were, by the weight of his own frame.

Friendly assistance was immediately proffered.

'Thank you,' he said, a little dazed by the fall; and he attempted to rise, but sank back again helpless, biting his lip because of the excruciating pain in his left-leg.

At that moment an official in a red cap arrived upon the scene.

'An accident?' he inquired in a voice that was both authoritative and kindly. 'Softly, sir; softly. You are hurt, and may be injuring yourself.'

'But I have no time to wait,' fretted the lieutenant. 'I am going on in the express.—Here, lend a hand, some of you!'

With the assistance of two arms he lugged himself into the perpendicular, only to fall heavily against one of his two supporters. The right-foot was fairly steady, but nothing seemed able to induce the left to remain planted on the ground.

'Take him into my office. I will attend in a minute,' said the red-capped man as he hurried off.

The lieutenant began to beat about with his arms.

'No, no—not the office! Not the office!' he almost wailed. 'I am going on with the express, I tell you! What is that whistle? The train off? Let go, I say!'

As past him the dark bulk glided away into the morning shadows—for his supporters had not let go—Lieutenant Radler stretched out his hands towards it, as though to hold it back. But for the curious feeling of faintness that had come over him, he would probably have wrenched himself free.

The red-capped stationmaster was back again in a moment.

'Don't be anxious,' said that official, who, in the growing light, revealed himself as a haggard but kindly faced man of about forty. 'I shall have your things stopped at the next station and sent here—in case you cannot proceed.'

'I shall certainly proceed, either alive or dead,' replied the lieutenant between his teeth; but he made no further resistance, for the pain was growing unbearable.

The first cursory and unprofessional examination revealed only the already patent fact that the traveller could not stand upon his left-foot. Nothing definite could be known until the arrival of the doctor who had been sent for, but who could not be here for two hours, seeing that this small country station stood only for a handful of huts.

Upon a patent-leather sofa, with the click of the telegraphic apparatus in his ears, Lieutenant Radler lay for two mortal hours waiting for his verdict. It came towards nine o'clock with all the lucidity that could be desired.

'Compound fracture of the shin-bone.'

'And how long will it take to mend?' asked the frantic man, glaring at the doctor as though at an incorporated fiend.

The doctor raised his shoulders with true professional equanimity.

'It may be a month; it may be two.'

Groaning, the lieutenant sank back among his cushions.

'But of course I can be moved?'

'Not unless you are anxious to remain a cripple for life. The bone, once set, should on no account be disturbed, and it is high time to set it.'

'But I can't'—— began the unhappy lieutenant; when the haggard-faced stationmaster gently interposed:

'Don't agitate yourself, Herr Lieutenant. We have plenty of room here, and my wife will take care of you; she is a famous sick-nurse.'

Lieutenant Radler began by glaring at him almost as fiercely as he had glared at the doctor. Were all these people leagued together to cheat him of his holiday? But within the same moment shame came over him.

'You are too good; but how can I'——

'How can't you—since you have no choice? There is nothing but the village here, and not a house in it where you could decently lie.'

With as bad a grace as possible, Lieutenant Radler closed, perforce, with the offer. The fury

in his soul left, for the moment, no room for gentler sentiments. Even when, within a few hours, he found himself lying in a spotless bed, his injured limb set, the light carefully tempered by the hands of his fat and smiling hostess, and a glass of excellent lemonade, made by those same plump hands, standing by his side, it was something very far from gratitude that filled his mind. To be here, almost within touch of the great iron thoroughfare, within sound of the signals, the very clash of the engines that were bearing luckier folk towards the capital—was it not enough to make the unlucky one grind his teeth against each other? To come to grief over a hurdle at the regimental steeplechase would have been a mere joke compared to the idiotic irrelevancy of this incident.

Presently he set to calculating feverishly how much of his time might still be saved out of the wreck. One month or two, the doctor had said—put it at six weeks. That would mean a fortnight in Vienna—a mockery compared to his yesterday's dream, and yet very much better than nothing at all. Upon this one problematical fortnight he now began to set his mind convulsively, as though upon a star of hope.

It was on the third morning after the accident that the fat stationmistress—that was the way he designated her in his mind—brought him in, together with his soup, a small bunch of snowdrops to set beside his bed. He had not been aware of caring for flowers, but the sight of the little spring messengers certainly seemed to make gayer the solitude of the sick-room.

'Are these out of your garden?' he asked almost amiably.

'Yes; we have a corner for them. It was Anita who gathered them.'

'Who is Anita?'

'Our daughter. The only one we have.'

A daughter? The lieutenant instinctively pricked his ears. Ere this he thought he had heard the sound of a girl's voice—a marvellously sweet voice it had seemed to him, too, despite his ill-humour—on the staircase outside. If her face were as pretty as her voice, might she not do well enough to help to while away the weary weeks before him?

'If she's anything worth looking at I'll flirt with her till within an inch of her life,' was the thought in his mind, as he somewhat grimly contemplated the snowdrops. From a boy he had been successful with the women; nor had he allowed his powers to rust in his two years' exile, pretty faces, thank Heaven! not being a monopoly of civilisation.

He began to wish that Anita would feel moved to lend her mother a hand in the cares of the sick-room.

As though in answer to his wish, next day, just at the hour that he was expecting his soup, there was a light step on the landing outside, and a very soft knock at the door.

'Come in,' he said expectantly, having first given his moustache a rapidly correcting twirl.

The door opened to admit a small, wizened figure, which in two thin and wax-like hands carefully bore a cup. She limped a little as she advanced slowly, her eyes earnestly fixed upon the full cup, of which she was evidently determined not to spill a drop. At the bedside only she looked up, and it was the look in the big brown eyes which told the lieutenant that, despite her old woman's face, she could not be more than ten years old at the most.

'I am Anita,' she said in the same voice that he had heard upon the staircase; 'and mamma has sent me with the soup because her hands are covered with soap-suds. It is washing-day, you know.'

'Ah!' almost gasped the lieutenant. 'You are really Anita?'

'Of course I am.'

'And you have no sisters?'

'Ah, no. I am alone.'

'Thank you,' he said hurriedly, as he took his soup out of the hands of the child-cripple, all his guiltily frivolous thoughts of yesterday rushing over him the while as though in a torrent of shame.

'I will wait for the cup,' she said, sitting down uninvited upon the chair beside the bed. 'Does your leg hurt very much?'

'Not so very much now.'

'I wonder if it feels like mine?' said Anita reflectively. 'I mean when it's bad.'

'Have you had an accident too?' he asked, looking at her with a new interest. 'Did you fall down when you were running about?'

Anita shook her rather large head.

'I never run about. It has always been like that. But it doesn't hurt always; and I'm sure yours hurts more,' she added as a sort of polite after-thought.

'Perhaps. But then I shall be able to run about again soon; at least the doctor says so.'

'Ah! I am so glad,' said Anita, in an accent which, strangely enough, sounded sincere.

The lieutenant looked at her, a little bewildered.

'And you?' he almost timidly inquired. 'Will the doctor not make you well too?'

'Not *this* doctor. He says he can't. But there is another doctor who lives in Vienna, and they say he could make me well. But it costs too much money,' finished Anita in a perfectly business-like tone. 'This one can only stop the pain sometimes. I wouldn't mind the leg so much, you know,' she added, growing more confidential, 'if it wasn't for the side. That is worse than the leg—when it comes.'

'Are you not very unhappy?' blurted out the lieutenant, losing his bearings more and more under the gaze of the childish eyes.

They opened still wider at the question. 'Why should I be unhappy, when it doesn't hurt? And very often it doesn't hurt, you know. Sometimes I can play all day in the garden without feeling anything.'

'And what do you play at?'

'At trains, of course,' she said; which clearly betrayed astonishment at this strange ignorance. 'Papa gives me little bits of the old rails, and I pretend there are carriages upon them. The fountain is one station, and the acacia-tree is another. I will show it you all when you come downstairs. I have got red flags, too, for the signals. And oh, by-the-bye'—she got up quickly—'I think I must have left one of my flags here. There it is in the corner!' And she limped towards it.

'Is this your storehouse?' smiled the lieutenant.

'Oh no; it is our bedroom. I mean that mamma and I sleep here usually.'

'And where do you sleep now?'

'In the little room beside the kitchen where papa usually sleeps, and papa sleeps in the office.'

'Good gracious!' said the lieutenant, lying back among his pillows.

Left alone again, he felt about as small as he had yet felt in his life.

Next day he wondered whether it would be Anita who would bring him his soup, and almost hoped the washing-day would prove to be two. But it was the stationmistress who came in with the cup, her broad face not as placid as usual.

'Anita has got one of her bad days,' she said in answer to his inquiry. 'It's her side again.'

'Can nothing be done?'

'Not without money,' said the mother, as simply and almost as philosophically as the child had discussed this same subject.

. . . . . .

Four weeks later Lieutenant Radler was able to hobble down on crutches to the little, highly ornate garden which flanked the station-house. Here, in a basket-chair, he drank in the April sunshine, principally in Anita's company, since the cares of office kept the father, and those of the household the mother, occupied for most hours of the day and partly of the night. He had been introduced to the station at the fountain and at the acacia-tree, had admired the goldfish that lived in an old boiler, and when the sun grew too warm he took refuge in a summer-house so cunningly overgrown with climbers that no one would have guessed it to be the section of an old railway-carriage.

During those weeks something like a friendship had grown up between the cavalry lieutenant and the cripple child, whose quaint conversation presented the only available form of entertainment. Though he had not ceased to groan in spirit over the bitterness of seeing the time and the money destined for golden pleasure melting away in dullness and doctor's bills, the lieutenant had actually arrived at discovering that, compared to the fate of the little brown-eyed girl, his own was, after all, not quite coal-black. He had even come to share some of the parents' anxiety. On the 'bad days,' when he sat alone in the garden, he had a sense of desertion, and when Anita reappeared, drawn and white, would greet her with an affection that was almost brotherly. To himself this was rather astonishing. Hitherto he had not been aware of caring for children any more than for flowers.

While his own foot progressed, Anita's health did not. It was as plainly written in the lines of the father's haggard face as on the waxen one of the daughter, far more plainly than on the placid countenance of the mother, on which the layers of fat probably forbade the penetration of sentiment. More than once he caught some talk of the doctor in Vienna and of the possibility of a cure, but the impossibility of facing the expense.

The lilac-bushes in the little crowded garden, where, despite the soots, the spring flowers rioted, were just coming into bud, when Lieutenant Radler, now moving about pretty freely on his crutches, one evening surprised his host with his face in his hands, and the lieutenant was shocked at the anguished look in the eyes which were raised to his.

'She is not worse, is she?' he asked quickly.

The stationmaster rose and took his red cap from its peg, for there was another train due.

'Yes,' he said, with something new and hard in his voice, 'she is worse; but maybe she will soon be better. I am going to send her to Vienna.'

'Ah! you have found the means?' said the lieutenant quite joyfully.

'Yes, I have found the means.'

And he went out without returning the other's look.

In less than two days the lieutenant and the stationmaster were living *en tête-à-tête*. Mother and daughter had departed for Vienna, not without Anita presenting her friend with one of her red signal flags as a souvenir.

'It's the turn of *my* leg to be mended,' she said to him gaily at parting.

The lieutenant laughed encouragingly. From his talks with the doctor he knew that, under the requisite treatment, there actually was some hope for the cripple. All the more did he wonder at the father's evident depression and at the nervousness which seemed to be growing upon him. At every unexpected sound—and yet they lived in the midst of sounds—he could see him start, as though in expectation of some calamity. All the kindly good-humour seemed to have been wiped out of his face by paternal anxiety.

The day before the lieutenant's ardently yearned-for departure was reached, and his boxes were all but strapped for that Viennese El Dorado in which he would yet be able to taste a fortnight's bliss, when he saw the stationmaster turning from the telegraphic apparatus with a face almost as white as the strip of paper he held in his hand.

'From Vienna?' he asked breathlessly.

'No, from Krakau. They are coming in an hour.'

'Who? Your wife and daughter?'

'The inspectors. The station is to be visited.'

'Ah, is that all?' said the lieutenant, breathing again. Were not these surprise inspections just as

much a commonplace of railway as of military life? All the same he was struck by the other's look. In these past six weeks he had grown almost as much interested in the father as in the daughter—much more interested than he would have thought it possible to be in any one who did not wear a hussar uniform. And there was the sense of obligation to quicken his perceptions, of an obligation which grew more oppressive as the moment of departure approached.

An hour later two elderly and uniformed individuals descended from the Krakau train. In that hour the stationmaster seemed to have recovered at least part of his composure. It was with an unimpeachable bearing that he welcomed his superiors; but the lieutenant, who was watching him, noted that the morning's pallor still lingered in livid streaks about his eyes and mouth.

The inspection took its ceremoniously pedantic course. Warehouses, engine-sheds, coal-bunkers, were visited, menials interrogated, the working of the signals looked to. Finally, the office was reached. Lieutenant Radler, who had here taken refuge from a heavy shower, rose from the patent-leather sofa, and was politely requested not to disturb himself. The books having been gone over, the elder of the two officials approached the money-safe, at the same time putting out his hand for the key.

At that moment the lieutenant, looking across the room, saw a sort of convulsion pass over the stationmaster's face. His nerves, kept under control for two long mortal hours, seemed suddenly to have become unmanageable. The fingers with which he was feeling about aimlessly in his pockets shook visibly.

'I cannot find the key—it is not here,' he stuttered.

At sound of the words the leading inspector wheeled round and looked first at the stationmaster and then at his colleague. The glance exchanged was fraught with ominous meaning. Both of them had heard ere this of lost keys, and in the experience of both it boded nothing good.

'You have mislaid it, no doubt,' said the younger and politer of the two officials. 'Perhaps you will be so kind as to search without delay, our time being short.'

'A locksmith would be quicker, I fancy,' observed the other dryly.

Another spasm seemed to pass over the stationmaster's face.

'Ah, not a locksmith, I beg of you!' he said in a tone which had become abruptly imploring. 'I—I will look for it. It cannot be far.'

'It had better not,' said the senior inspector.

The unhappy man took out his handkerchief and passed it across his forehead.

'If you will go meanwhile—to the waiting-room, perhaps it will be more comfortable. I will turn out the drawers here.'

Coldly they agreed, and were scarcely in the waiting-room before they exchanged another significant look, and then, as though by mutual consent, took their position at the window, which, most fortunately, commanded the road. It was only from some Jew in the village that the suspected man could hope to procure the missing sum. There was no other possible saviour within reach. To the lieutenant they had seen in the office neither gave a second thought, a cavalry lieutenant in Austria being always instinctively regarded as impecunious.

When the stationmaster returned from the waiting-room he walked straight past the lieutenant and into the small back-office, which was used principally as a store. As the door closed the young man, moved by some force independent of his will, started forward.

At the moment that he opened the door his host was taking out of a drawer something which the lieutenant knew to be a revolver before he had seen it. There was a spring and a short struggle. Then the lieutenant, having first drawn the balls, turned to the stationmaster.

'How much have you taken out?' he asked, looking him in the eyes.

'Four hundred florins,' said the man in a voice too flat for shame.

For a moment Lieutenant Radler stood immovable. Four hundred florins was very nearly all that remained to him of his original six hundred. Very quickly a battle was fought in his mind. On one side there was the vision of the Vienna fortnight, that precious fortnight snatched from the ruins of his holiday; on the other side, Anita's face and the look in her suffering brown eyes. The struggle was fierce but very short. Scarcely a moment seemed to have passed before he said in the tones he used when commanding his troop:

'Give me the key of the safe!'

The stationmaster put his hand in his pocket and gave it him automatically. He was looking and acting like a person suddenly struck stupid.

'You must show me where to put it,' said the lieutenant in the same tone. And together they returned to the outer office.

At the last moment something like a flash of intelligence seemed to come over the stationmaster's dazed face. While the lieutenant was replacing the bank-notes he put out his hand as though to stop him.

'But I shall never be able'—— he began.

But the lieutenant only pushed him aside as he closed the safe door.

A few minutes later the two inspectors were making most polite remarks, which had in them a ring almost of apology. In face of the unimpeachable completeness of the contents of the safe, neither of them was now able to understand how, even for one moment, he could have doubted so tried and faithful an official.

Not until another train had borne them farther down the line did Anita's father appear to come to his senses. It was then that, without a word, turning to the lieutenant, he seized his hand, and,

to that young man's extreme consternation, pressed upon it a kiss as fervent as though he had been either a beautiful lady or an old priest.

After a minute the stationmaster spoke.

'I am not a bad man,' he began very low and uncertainly, 'but it was a question of saving her life; and now you'——

'And now it is I who have saved it,' finished the lieutenant, with a strange, new light-heartedness which he had never known before—not even in the Vienna opera-house.

When next day he departed—not towards the capital, for what remained of his money would only just take him back to his station—the light-heartedness still persisted. Was it because he felt relieved of the burden of gratitude that he was able laughingly to receive the condolences of his comrades upon his missed holiday, or was it perhaps the strange novelty of the first consciously useful act of his life?

Whichever it was, he could not manage to regret that that step had been so slippery on that dark March morning.

THE MONTH: SCIENCE AND ARTS.

OUR COAL-SUPPLY.

TIME after time a note of serious warning has been sounded by geologists and others as to the rate at which we are using up our coal deposits, and prophecies have not been wanting to the effect that in one or two brief centuries the British coalfields will be exhausted. The recently issued final report of the Royal Commission on Coal-Supplies is by no means of this pessimistic character, and we can go on burning coals, and exporting them too, without any fear that we are depriving posterity of its fuel. The commission held forty-seven meetings and examined one hundred and twenty witnesses, and their report is unanimous. They adopted four thousand feet as the limit of depth in working, and one foot as the minimum workable thickness of a seam. Working on this basis, they estimate that we have no fewer than one hundred thousand nine hundred and fourteen million tons of coal in the natural cellars. As to the probable duration of this vast reserve of fuel, that of course must depend on the maintenance or the variation of the annual output, which stands at present at two hundred and thirty million tons, with an increase for the past thirty years of 2½ per cent. per annum. The commission have reason to believe that in the near future the rate of increase will be slower, followed by a period of stationary output, and then a gradual decline.

COAL FOR THE NAVY.

There has of late been so much discussion with regard to conserving the Welsh steam-coal for the use of our own navy that the opinion of the commissioners on this subject is worthy of attention. During the past ten years the consumption of this particular kind of coal by the British navy has greatly increased, and our ships take one-sixteenth of the entire output. Experiments are constantly on foot with different kinds of coal for our warships, but Welsh coal reigns supreme. In the mercantile marine cheaper grades of coal have come into use with improved boilers and furnaces, and in both services oil has been tried with some success; but there is at present a difficulty in securing an adequate and regular supply of a suitable fluid. But for auxiliary purposes on our men-of-war internal-combustion engines, fed either by gas-producers or by oil, are certain to come into extensive use. The commission close their report by observing that 'there seems no present necessity to restrict artificially the export of coal in order to conserve it for our home-supply.'

WIRELESS MESSAGES IN WAR.

Speaking at the Society of Arts, London, Captain L. James, who, on behalf of the *Times*, was the first war correspondent to use wireless telegraphy, gave a very interesting account of his employment for six months of the De Forrest system, after which the Japanese stopped it. During that period he sent messages of one thousand five hundred to two thousand words at a rate of thirty to forty words per minute over distances ranging up to one hundred and fifty miles, and in no case did other systems in use by the Italians, Russians, and Japanese interfere with his messages except when the stations were within a mile of one another. Still, he considered the risk of leakage of vitally important information so great that he thought that if wireless telegraphy be used at all in warfare, it must be controlled by the combatants under international law. Sir William Preece, who presided, agreed with the speaker that this was necessary, and he expressed the opinion with regard to wireless communication generally that the Marconi system was for sea and not for land, and that it was absurd to think that it would compete with submarine cables.

THE STEAM TURBINE AT ST LOUIS.

At the St Louis Exposition a steam turbine of six hundred horse-power, of the Westinghouse-Parsons type, was employed to furnish light and power to the various buildings, and it was at work night and day for five and a half months at a speed of three thousand six hundred revolutions per minute. Never before had an engine of this kind been subjected to such an ordeal, and much interest was

evinced on the part of the engineers present when the turbine was brought to rest after its long run and examined. It was found to be in perfect condition and without the least sign of wear, even the tool-marks which were on the bearings when they originally came from the workshops being distinctly visible. This result is the more extraordinary when it is remembered that the load carried was constantly being varied, and that the total number of revolutions of the shaft was but little short of one billion.

MOTORS FOR TRAM-LINES.

Electricity is undoubtedly the best source of power for tram-lines, but its adoption is fraught with difficulties. The installation is expensive, and if the underground conduit system be chosen—and this is generally considered to be the best method—the upheaval of the roads while the conduit is being built is a most serious hindrance to business and traffic. The cheaper overhead trolley system, on the other hand, means a constant eyesore, while there is always present the element of danger in case of the breakage of any of the wires. The busy metropolitan district of Shoreditch has resolved to do away with its horse-drawn tram-cars; but as it was at variance with the London County Council as to which electric system to adopt, it has been decided to settle the question by the employment of petrol-driven motors. Motor-omnibuses have long ago become familiar in our streets; but the application of this form of engine to tram-line work is a novelty, and the experiment will be watched with much interest.

COLD WEATHER.

The Rev. S. D. Sander, of Thornton Heath, Surrey, writing to the *Daily Telegraph*, reminds us that the cold weather recently experienced cannot be compared in intensity with that of former winters. In December 1874, when he was a rector in Durham, his thermometer six feet from the ground never rose above zero Fahrenheit, and at Carnforth colliery the mercury sank to six degrees lower than that. At Thornton Heath in 1895, when there was such a long spell of frost that the ground was frozen to a depth of three feet and most of the water-pipes were frozen, a thermometer outside a bedroom window showed twenty-four degrees of frost. He is of opinion that the British bear extremes of heat and cold better than any other people of the world, and cites as an example the death through frost of a well-known Swiss guide, while the British tourists whom he was guiding escaped scot-free.

HAUNTS OF THE FAIRIES.

What is described as a rare antiquarian discovery has been made in County Antrim, Ireland, at a farm at Markstown, Cullybackey. The find consists of two subterranean dwellings, which are supposed to date from pre-Christian times, and to have formed the retreats of the ancient Irish. The entrances to these holes in the ground, which are about five feet high and twenty feet long, and lined with rough hewn stone, are very narrow, and were no doubt designed to protect the dwellers from fear of invasion. It is somewhat rashly assumed that these roughly built refuges, which would admit of the inmates popping in and out of sight like rabbits, may have contributed to the belief in the existence of fairies. But the world was far younger when men's imaginations invested every natural thing with its guardian spirit, and when sylphs of the air, gnomes of the earth, undines of the water, and salamanders of the fire laid the foundations of our fairy-tales.

JAPANESE DIET.

The nations of the world have now had the opportunity of learning many a valuable lesson from the general management of the Japanese army. Quite apart from its qualities as a fighting-machine, there is that wonderful power of organisation which has contributed so greatly to success in the field, and which has also tended to lessen the general death-rate. It is interesting to note that the hard work done by the Japanese Tommy is performed on a dietary table which would hardly satisfy the soldiers of any other country. A large quantity of the Japanese soldiers' rations is made up of compressed fish-meal. This is obtained by freeing the fish of all bone, and smoking and compressing the flesh in such a manner that it becomes perfectly dry and hard. It is eaten with rice or made into soup. Another form of food which seems peculiar to the Japanese army is obtained from kelp and other seaweeds, many of which afford very nourishing sustenance. It appears that fish in any form does not enter into the dietary of the British army.

At home this is the bill of fare of a Japanese family in moderate circumstances, according to C. Kadono in the *Times*. Breakfast (about 7 to 7.30 A.M.)—miso soup (with vegetables, tofu, &c.), pickles, boiled rice, tea (sometimes raw egg or boiled sweet soya beans, or natto). Lunch (12 noon)—fish boiled in soya, vegetables stewed in soya, pickles, boiled rice, tea. Supper (6 to 6.30 P.M.)—soya soup (with vegetables, fish, &c.), raw fish sliced and eaten with soya sauce, broiled fish (or boiled) with vegetables (or butcher meat or fowl and vegetables stewed), rice, tea. The Japanese physique is thus largely built up on the product of soya beans, which are grown all over Japan and in Manchuria, and from which miso, soya, and tofu are made. Soya beans, which, we believe, are not to be had in this country, are much richer in albumen than either beef or mutton. The Japanese diet, therefore, mainly consists of rice, vegetables, and fish, with very small and occasional additions of butcher meat.

A NEW LIFE-BELT.

The Gros life-belt, which has recently been the subject of many experiments in France, is a distinct novelty, for it contains no bulky material like cork, nor does it require inflation with air by its wearer.

The entire arrangement is comprised within the limits of a gauze vest, which can be worn without inconvenience or attracting attention. Within the vest are four pouches, presumably of india-rubber, two of which are at the back and two in front of the body. Connected with these are tubes which terminate in small metallic receptacles containing carbide of calcium, which, as every cyclist knows, gives off acetylene gas when moistened with water. In one experiment a man wearing one of these vests or belts was thrown into deep water, and at once went down. He had no knowledge of swimming; but in two seconds he was at the surface once more, the gas having immediately distended the pouches beneath his vest, and he continued to float with head, shoulders, and arms above the water until rescued. Various steamship companies and life-saving societies in France have expressed their approval of the invention.

THE CORELESS APPLE.

We have received many inquiries regarding the new coreless and seedless apple; and many are asking how, under such apparently hopeless conditions, such a fruit can be propagated. The careful experiments which have led to its production are due to Mr J. F. Spencer of Grand Junction, Colorado, who, with the example of the seedless or navel orange before him, believed that similar results could be produced with apples. Many persons have been inclined to believe that this new fruit is the product of a fertile imagination; but, as a rather foolish old adage tells us, 'seeing is believing,' and when we look upon the photographs recently published in the *Scientific American*, we can no longer doubt that a very great advance has been made in apple-culture. To Mr Spencer the fruit is no new thing, for several years have elapsed since he first began his experiments. He first produced five trees which bore seedless, coreless, and wormless apples, and from this quintet he has budded two thousand more, which are destined to supply the world. It is calculated that by the autumn of the present year two and a half million trees will be available for distribution. The tree has no blossom, if we except the little bundle of green leaves which grow around the baby-apple to shelter it. This means that the apple is not attacked by the codling-moth and is immune from the ravages of frost.

MOTOR-BOATS.

The automobile issue of the *World's Work and Play* contains a number of interesting articles dealing with the application of the petrol-engine to industrial purposes. To many readers the paper concerning the motor-boat and its future will prove the most attractive, because there are thousands of persons who own some kind of vessel to which the addition of an engine to take the place of oars or sails would be regarded as a most desirable luxury. We do not here refer to racing craft, in which speed is the main consideration, but to the more humble sailing or rowing boat or punt in which the man of moderate means delights to lazy away an occasional well-earned holiday. The cost of a motor-boat complete is small compared with that of a motor-car, and we have it on the authority of this article that a petrol-motor can be fitted to an ordinary boat for something under thirty pounds. It is not for us to point out any particular form of boat or of motor as being superior to its fellows; our chief object is to call attention to the fact that the internal-combustion engine is adapted to pleasure-boats as well as to racing-craft.

BAUXITE BRICK.

A refractory firebrick made of bauxite, one of the ores of aluminium, has recently been severely tested in some of the principal steel-furnaces. The value of this particular stone as a refractory material has long been known; but there has been a difficulty, owing to its want of cohesion, in moulding it into the required form, and therefore the far more expensive magnesite brick is commonly used. The difficulty, it is claimed, has now been overcome in a patented process which will give steel-makers a brick which is equal to magnesite, but far cheaper. The new material is said to be especially adapted for the lining of basic open-hearth furnaces, the highest-grade bauxite brick being used up to the slag-line, while above the slag-line a cheaper brick containing a lower percentage of bauxite can be employed.

THE BRITISH ASSOCIATION.

When the British Association for the Advancement of Science was first established, any one who prophesied that it would ever hold one of its annual meetings in South Africa would have been regarded as an idle jester; but the meeting of 1905 is to open at Capetown for its first part, and will hold a kind of second session at Johannesburg. The secretaries are, we understand, well advanced with their arrangements, and are making haste to ascertain how many members they will have to cater for. It should prove a most enjoyable holiday to those who can spare time for the somewhat protracted journey which a visit so far from home entails. As at present arranged, the official party will leave this country on 29th July, getting back during the first week of October. The Union Castle Steamship Company offer a substantial reduction on the ordinary cost of return tickets to members of the Association, while in South Africa itself the railway companies promise to be generous in the matter of reduced fares and free passes. The organising committee in South Africa have already received numerous offers of private hospitality at Capetown, Johannesburg, and other places which the Association will visit.

BOOK-COLLECTING.

To an outsider, devoid of interest in the game, book-collecting appears a mild kind of madness; and the fact that a man's purchases over a course

of years wander into every room in the house, and meet the visitor at the door, is thought to be further proof, if any were needed. There is pleasure nevertheless—nay, much intellectual and sometimes pecuniary profit—in the pursuit when intelligently pursued. *Memoirs of Book-Collecting* (John Grant, Edinburgh), by Mr W. Carew Hazlitt, will help the reader and purchaser to be more intelligent at the business. The author, a grandson of Hazlitt the essayist, was brought up as a civil engineer, but left that for journalism, literature, and archæology. He has written about his grandfather and Charles Lamb, and has edited, besides, an edition of Lamb's delightful *Letters*. The result of his study of books in all their branches was embodied in the eight volumes of his *Bibliographical Collections* (1867–1903) and *Confessions of a Collector* (1897). Much material and experience so gained has been woven into this new volume. The game is up for the collector now in town and country, we are told; the three kingdoms have been so well ransacked and exhausted. Edinburgh has lost its position too, although Mr William Henry Miller of Craigentinny, an Edinburgh solicitor, gets the credit of founding the Britwell Library, which Mr Hazlitt says is one of the finest private libraries in the kingdom. In default of succession, Mr Hazlitt believes the Advocates' Library may heir this valuable library, which includes the bulk of Richard Heber's Early English poetry. Mr Hazlitt discourses pleasantly on every side of book-collecting, and his book will be valued by all interested in the subject.

THE BEARDMORE TREFILAGE STEEL-MAKING PROCESS.

Messrs Robert Napier & Sons, the Clyde shipbuilders and engineers, owned Parkhead Forge, near Glasgow, when Mr Rigby, one of the partners, invited the late Mr Beardmore, of London, to join the firm. Experiments were then made in rolling armour-plate, which were revived, and have since proved successful, under his son, Mr William Beardmore, head of the firm of Messrs W. Beardmore & Company. The firm purchased the old yard of the Napiers at Govan and engine-works at Lancefield, but have deserted these in favour of what will be one of the largest new shipbuilding yards in the world, at Dalmuir, between Glasgow and Dumbarton, where the plant is of the newest and most up-to-date character. There the new troopship *Lord Nelson* is to be built. The latest addition to the plant at their Parkhead Works, as the *Glasgow Herald* has pointed out, is the Trefilage process of steel-making. In this process, unlike that of the Whitworths, the pressure is applied from below, the metal being forced up into the conical-shaped cast-iron mould. By this means the pressure is applied in the most effective manner, and, the solidification of the molten steel taking place under conditions favourable to the formation of the best structure, segregation is reduced to a minimum; and, as was proved by cutting one of over twenty tons through its longitudinal axis, an ingot is obtained from which piping has been entirely eliminated. Tests taken from this ingot were equal in tensile strength and ductility to the best forgings. Besides getting rid of 'piping,' other defects common to ingots cast in the ordinary way are greatly minimised. The plant at Parkhead is the only one in this country capable of dealing with heavy ingots. Ingots up to forty tons in weight can be treated by this Trefilage process. The War Office and Admiralty are greatly interested in the new process, which offers an effective means of overcoming many of the difficulties attendant on the manufacture of heavy shafts and other forgings, and reduces to a minimum the possibility of failure under working conditions. The process is being applied to ingots for forgings of all kinds, including shafting, straight and crank axles, and also to heavy marine boiler-plates. Its introduction may fairly be said to mark a new era in steel manufacture.

THE EXILES.

THOUGH ours it be to pass beyond the ocean,
Amid some far-off, alien race to dwell,
How often through our mind some memory passes
Of England loved so well!

Perchance some picture of an April morning,
With all its sweetness of unfolding day,
When it was good to live, and every heart
Was young and gay;

An English garden bright with summer flowers,
And brighter down the path of distance seen,
With shady walks and leafy nests of birds
And lawns so cool and green;

Or some high mountain swept by autumn winds,
And dark clouds whirled across the evening sky,
And driving mist, and flocks all hurrying home
With sad, bewildered cry;

An English church with God's own garden circled,
Wrapped in its winter mantle, while there swells
That voice which seems to reach us o'er the ocean,
Of Christmas bells.

O England! Motherland! in rain and sunshine,
Springtime and autumn, to our memory dear,
Remembrance of thy beauty charms our exile
Through all the weary year.

AN EXPERIMENT IN NEUROLOGY.

By A. M. Belding.

CHAPTER I.

HAD a business proposition been presented to Nathan Winfield of Boston (Mass.) he would have looked it through and through, turned it over, examined the edges, and asked a little time for consideration. But this was merely an affair relating to his son, Nathan Winfield, junior; and, moreover, the stock-market was greatly excited.

His failure to recognise certain facts which were made amply clear to his mind at a later stage did not, it is true, quite lead to a tragedy; but it caused the old gentleman no little anxiety; and it brought to the lighthouse-keeper's daughter at Cliff Harbour, on the shore of the Bay of Fundy, an entirely unexpected and wholly munificent wedding-gift.

Nathan Winfield, senior, was so thoroughly engrossed in business affairs that he had found no time to devote to the affairs of Nathan Winfield, junior. The latter, having little else to do than amuse himself, pursued that course with a vigour and enthusiasm which produced results not wholly creditable to the parental record and training, and at the same time quite destructive to the young man's nervous system.

Of course there had to be an awakening. The family physician presented the case tersely and forcibly to Winfield, senior. 'That young man's nerves,' said the doctor, 'are in such a condition that I tremble for his life. The case is serious—most serious. His whole course of life must be changed—and at once.'

'Bless me!' ejaculated Mr Winfield. 'I shall attend to the case. I had no idea of it. I thank you, doctor—I thank you.'

Thus startled into a consciousness of the need of drastic measures, Mr Winfield made some inquiries, paid some bills, and reflected. Once, on a summer holiday, he had spent a week at Cliff Harbour, in the Canadian provinces. It was quiet, out of the way, picturesque, and blessed with a wholly delightful summer climate. Two or three months spent there would be a tonic and corrective, and the young man would return home healthy in mind and body.

Had Mr Winfield taken a little more time for reflection he might have discovered that none of the tourist literature relating to the region in question claimed for its salubrious climate the power to change a young man's nature. But time was valuable, and the stock-market had become quite feverish. He wrote a cheque; gave it, with a terse command, to Nathan, junior; and once more plunged into business.

The young man received the checque and the ultimatum, to his credit be it said, with dutiful regard—largely due, no doubt, to the doctor's warning and a knowledge of his own physical condition. He went down to the provinces, and in due time found himself on the stage which conveyed passengers from the nearest railway station to Cliff Harbour.

There is something so attractive and soothing in the appearance of a young woman who is at once lovely and modestly self-controlled that even a young man whose nerves have gone wrong is graciously influenced by the subtle and inexpressible charm. Indeed, young Winfield had almost forgotten his nerves, sorely shaken though they had been by the journey, before the stage had proceeded very far on its way from the railway station toward Cliff Harbour. For a young woman who might have ranked as a queen in the class described was among his fellow-passengers. He secretly studied her with growing approval; and when, after a time, her eyes met his, in a casual glance betraying neither timidity nor self-consciousness, he surprised himself by feeling a genuine thrill of exultation. He was no stranger to pretty girls in his own social set in Boston, and was not unknown to certain graceful maidens on the stage; while the fair cashier in a certain busi-

[*All Rights Reserved.*]

ness establishment had been heard to say in strict confidence that Mr Winfield was the most accomplished and generous of young men. But all this was in and of the city of Boston. It had nothing to do with an afternoon ride by stage through a picturesque region, amid strange but agreeable surroundings, the central figure of which was the loveliest girl, it seemed to him, that he had ever seen.

She was going to Cliff Harbour. He learned that fact easily enough. She addressed the stage-driver by his first name, and asked him a question. That personage, being interrogated at the moment when he was taking a fresh chew of tobacco, leisurely completed the task, and drawled a reply, with this additional observation:

'There ain't been a thing happened since you went away last week.'

Under ordinary circumstances, a stranger might entertain doubts concerning the attractions of a place where nothing happened for a week; but Winfield was quite oblivious to any such consideration. He was already weaving romances, and wondering how he might make the acquaintance of this magnetic vision of loveliness. He entered into conversation with the driver, who, between copious expectorations and frequent snappings of his whip, imparted general information concerning the region around Cliff Harbour. But while Winfield was talking with the driver, he was conscious that he was talking at the young lady, and was duly grateful when the man with the whip opened the way for him, without ostentation, to say something about himself. He was able, also, to grow enthusiastic over the scenery, for as they approached the village they had frequent glimpses of rugged cliffs and the shining waters of the Bay of Fundy; and when at last they rode down a steep hill, and followed the winding road under the shadow of a frowning height, to see the village ahead of them, and a beautiful harbour, almost landlocked, at their left, his ejaculations of pleasure and praise quite won the heart of the driver, and brought him the reward of an approving glance from the real object of his thoughts.

Unhappily for his nerves, the sense of elation following this coveted reward was short-lived. The stage rolled swiftly along the level village street, and drew up at the hotel. The passengers alighted. The young lady was met and assisted from the vehicle by a broad-shouldered, sun-browned young man, obviously not a relative, whom she greeted with marked cordiality, and who transferred her and her parcels with studious care to a light carriage.

As they drove away, talking and laughing together, Winfield of Boston discovered, with a shock, that he had brought his nerves with him after all. He approached the driver of the stage, paid his fare, and casually observed:

'You have very pretty girls down here. Who was the lady that came in with us?'

The driver ejected a large quantity of tobacco-juice, and replied with enthusiasm:

'Mister, that's the prettiest of the lot around here. She's Mollie Craig. Her father keeps the lighthouse on the p'int over there. You can't see it for the bluff and the woods. But you want to see it. It's only a little better 'n half a mile. Great view over there. But it's no use to go over to see Mollie Craig—while Dave Morton 's around.'

The concluding item of information was accompanied by a wink of familiarity which Winfield of Boston regarded, in the existing condition of his nerves, as a personal affront. He went into the hotel, partook of but little supper, and had a bad night. For Mollie Craig, from the moment the stage stopped at the hotel until she rode away with Dave Morton, had not so much as glanced in his direction.

CHAPTER II.

WINFIELD of Boston stood beside the lighthouse on the point at Cliff Harbour. Craig the lighthouse-keeper, a fine type of man, tall and erect, with long gray beard and piercing eyes under heavy brows, came out of the cottage and joined him.

'You're a stranger in these parts,' said Mr Craig. 'Like to look over the lighthouse?'

Winfield thanked him cordially, and they went into the structure and climbed to the chamber where the great light was placed. The keeper, with fond pride, explained its mechanism, and then they stood and gazed out upon the smiling waters breaking in white spray along the cliffs.

'I should think,' Winfield said, 'that you would have a heavy sea here in stormy weather.'

The old light-keeper swept the horizon seaward before he replied. Then he touched Winfield on the shoulder and slowly answered:

'Young man, since I've lived here I've seen storms; but it was nothing. For twenty years I kept the light on one of the rocks near the mouth of the bay. Day after day, week after week, month after month, year after year, the same—always the same. Only the waters around me—only the men who brought supplies to tell me of the outside world. It was well for me that I believed in God, or I should have gone mad. I tell you there's no experience to compare with it. You're alone—alone with nature and the God of nature. I don't know what you believe; but if you had lived my life you'd thank God that you were able to believe in something.'

'Mr Craig,' said Winfield, 'I had never thought of it in that way; but I think I can understand. It must have been terrible.'

He spoke deferentially, and Mr Craig was pleased. To please the father of Mollie Craig was one point gained. They talked for quite a long time, and then passed out toward the cottage and the road that led to the village. Winfield had in-

troduced himself, and was established on a friendly footing. That, he thought, was enough for one afternoon.

But Mr Craig was the soul of hospitality, and the fact that this young stranger had sought out Cliff Harbour as a health-resort appealed to his local pride. He felt an interest in the visitor.

'Come in,' he said heartily. 'Come in and take tea with us. My wife and girl will be glad to meet you.'

'You are very kind,' said Winfield, 'and I thank you very much. But that would be an intrusion. I shall be glad to call some other time, and talk with you of your experiences. They interest me greatly.'

That settled the matter. Mr Craig would listen to no refusal, and five minutes later Mr Winfield held the hand of Mollie Craig—far more charming in her own little home than when they had journeyed by stage together two days before. Her mother, too, was cordiality personified.

'Now this,' said Winfield to himself, 'is better than I expected. If the old man could see me now!'

He exerted himself to be entertaining, and succeeded admirably, for a man from Boston could talk of many things that were new and interesting at Cliff Harbour. They had enjoyed a tempting supper, and he was in the midst of an animated description of the crush at a championship game of base-ball when Mrs Craig answered a summons at the door and ushered in a visitor.

'Mr Morton,' she said, 'let me make you acquainted with Mr Winfield of Boston.' It was the broad-shouldered young man concerning whom the stage-driver had taken the liberty to indulge in a knowing wink.

'Confound him!' said Winfield to himself; but he returned Morton's hearty grip with assumed fervour. Conversation was resumed, but ten minutes later Mollie Craig asked to be excused, and withdrew; and when she came back, her cordial invitation to Mr Winfield to come again did not allay his resentment at the sight of her departure from the house in company with Dave Morton. They were going to a meeting together, and they would return together. All that was left to him was to make himself agreeable to her parents for a brief period, plead fatigue, and depart. He had another night with his nerves.

CHAPTER III.

THE people of Cliff Harbour and vicinity are of the same stock as the people of New England. Perhaps the former retain a little more of the Puritan in their views of life, and there is a difference in accent between the speech of provincialists and that of modern New Englanders; but in most respects the two people are much alike. Indeed, the difference is largely political. The provincialist to the manner born is not an unfriendly critic of American institutions, but there is a mental reservation. He may not have any sort of respect for the memory of George the Third; but he remembers that at the close of the American Revolution many thousands of loyalists followed the British flag into the inhospitable northern wilderness, and founded a new commonwealth. He also has in mind certain boundary and fishery disputes, and the like, which are part of Canadian history. In truth, he is intensely British in all his views and aspirations.

Winfield of Boston was not aware of the fact. It had never occurred to him, if he thought at all on the subject, that a Canadian could desire a better fate for his country than annexation to the United States. Great Britain was to him a grasping nation that from time to time needed a little discipline administered by the President of the great republic. Had he kept his views to himself it would have been better for his nerves; but it is always easy to be wise after the event.

A group lounging in front of the store at the head of the little jetty where schooners lay at Cliff Harbour were lazily conversing when Winfield joined them. It was a sunny afternoon, and the only sound was the creaking of the hoisting-gear, where two men were leisurely discharging merchandise from a schooner beside the little wharf. The group of men leaned against a railing or sprawled on the platform in front of the store. They were discussing the Boer war, and Winfield threw in a query.

'What possible interest,' he asked, 'can you people have in seeing England gobble up the country of the Boers?'

'The same interest, mister, that England would have if the Americans tried to gobble up Canada.' The tone was aggressive, and the speaker an athletic young fellow who had seen service in South Africa. Winfield was not aware of the latter fact, and was, moreover, in an irritable mood.

'Pooh!' he said contemptuously. 'What's England? The greatest land-pirate on the face of the earth.'

'Stranger,' said the ex-soldier, 'you'd better take that back. We're not used to it down here.'

'Why should I take it back?' sharply demanded Winfield.

'Because,' replied the other, 'if you didn't you'd be expected to back it up.' The speaker shook himself together and eyed Winfield with manifest hostility. The latter was no physical match for him, and knew it. The other men were now alert, expecting a fight. Winfield was trembling, not from cowardice, but from nervous excitement.

'Do you take it back?' sharply demanded the ex-soldier, advancing towards Winfield.

'Take what back?' called out a voice from

the doorway of the store, and in a twinkling Dave Morton was at Winfield's side, facing the others.

'This Yank,' said the aggressive young man, 'wants trouble. He says the English are pirates, and I jist want him to stand for it a minute or two. That 's all.'

'Well, he won't,' said Morton. 'I don't know what it 's all about, but this man is not well. He 's a stranger, and he 's down here for his health. You ought to be ashamed of yourself.'

'A sick man can be civil,' retorted the ex-soldier. 'I didn't know there was anything wrong with him.'

'You know it now,' curtly rejoined Morton. —'Come, Winfield, I want to show you my new boat.' They went along the shore together, and the incident was closed.

But Winfield would rather have taken a thrashing than feel that he was under an obligation to Dave Morton. For a week he had ardently tried to improve his acquaintance with Mollie Craig, and always the shadow of Dave Morton crossed his path. The effect on his nerves was distressing.

With the very best intentions, and wholly unconscious of the real effect produced, Miss Craig contributed in a large measure to the nervous discomfort of Winfield. She was very gracious to him, and, up to a certain point, sympathetic. Her father and mother liked the deferential young man, and Dave Morton regarded him with good-natured friendliness; while towards herself, when they met, the Bostonian was always politely and unobtrusively attentive. Whatever his thoughts, he wore the veneer of social custom with ease and grace. He saw her frequently, for it was a pleasant walk to the Lighthouse Point, and love of the picturesque in scenery was quite enough excuse for an almost daily stroll in that direction. But it was intensely aggravating, and at the same time increased his ardour, to feel that he was not being taken seriously by the young lady. His neatly turned compliments, his efforts to arouse a deeper personal interest in himself, his allusions to the greater enjoyment of life in a larger world than Cliff Harbour, were heard without emotion. The more futile his efforts the more deeply rooted became his feeling of resentment toward Dave Morton, between whom and Miss Craig, so far as he could learn, there was as yet no formal engagement. But this feeling he was compelled to suppress, to the further distraction of his nerves. For, once when he ventured a rather patronising reference to Morton, the expression of the girl's face, rather than anything she said, convinced him that it would not do. And when, the next afternoon, he capsized a skiff in the harbour, and Morton was the one to reach and rescue him, he cursed his fate harder than ever. The incident gave the lighthouse-keeper a text for a discourse when next they met, and the old man, to the manifest pleasure of his daughter, grew eloquent in Morton's praise.

'That young man,' said he, 'deserves credit. When his father died he came home and took up the work on the farm. He 's paid off a mortgage, made some money by a deal in lumber, taken care of his mother and sister, and stayed right here like a man when he had a good chance to do better away from home. And his word 's as good as his bond.'

To all of which, and much more, Winfield had to give outwardly cheerful assent. But had he been a modern hero of romance he must have laid some deep plot to ruin the reputation of his rival, or to remove him from his path. Being only a young man of ordinary attainments, he took it out of his nerves. They gave him sleepless nights, and in his mind he was a villain and a murderer many times over; but tragedies of that sort are commonplace.

(To be continued.)

'THE PEARL OF THE SILVER SEA.'

By John Oxenham.

SARK—so small a word to represent so much, so much in so little. To those who know, it means perfect rest from the stress and strain and turmoil of life, new delight in living, fresh strength for the work that lies ahead. The air is so sweet and vitalising, every breath is new life. The sea creams and foams like champagne; it is so crisply clear and bracing, you want to be in it half the day. The manners (which are charming) and the customs (which are quaint) are all such a combination of past and present that, with all the necessaries of modern life, you still live in the atmosphere of the feudal times.

We have a Seigneur, who is overlord of the island and is allotted a seat at the Coronation. We have a Seneschal, who adjudicates on the little differences which will arise even in the best-regulated families. We have a Sieur, a Prévôt, and a Greffier, two Connétables, twelve Jurats, and forty farmholders holding the forty farms into which the island was divided by Helier de Carteret in the time of Queen Elizabeth. In forty farms the land still remains, descending by entail, and subject to strange rights. If a holder dies and leaves no heirs the farm reverts to the Seigneur. The Seigneur collects his tithes in kind. When the corn is cut, nine stooks go to the farmer's stack and every tenth to the Seigneur. He has a share in the sale of every sheep and cow, rights of flotsam and jetsam, and right of veto in the Chief Pleas or island parliament, which meets at Michaelmas. Curfew

does not ring at night, but verily one expects it; and in place of it the gloaming lights the twinkling fires all round the wide horizon—Carteret due east, La Hague north-east, The Casquets due north, the beaded lights of Peter Port and St Sampson's in Guernsey due west, south of them The Roches Douvres, and due south the Corbière on Jersey; and up above in the deep-blue dome such quantities of shooting-stars as I never saw before in my life.

To those who have been there that little word Sark means much—it kindles the eye and sets the red blood jumping. It is a bond of union 'twixt man and man. Said one busy man of affairs to me, as we sat on Longue Pointe watching the red sun sink in an amber sky behind Guernsey and the tide race like a mill-stream through the Gouliot Pass, 'I live on this all through the winter, and look forward to it all the rest of the year till I get back here again.'

But by 'been there' I do not mean what some people mean.

'Been to Sark?'

'Oh yes! Ran across from Guernsey. Took trap round. Back same night. Pretty little place!'

And they call that seeing Sark! Why, they get just about as much impression of the real Sark as a dweller in Charing Cross Road gets of the country by passing Crosse & Blackwell's when they are preserving strawberries.

Yet that is how most folks see Sark and are satisfied. But the knowing ones come back year after year, stop a month or more each year, and still find novel beauties and hitherto undiscovered nooks and crannies of delight each time they come. The birds of passage assimilate Sark in five hours. The wise ones long for houses of their own there, and bespeak their apartments for next year before they quit them this.

For the demand exceeds the supply, and there are houses *and* houses, and wells *and* wells, even in Sark; and a deep well of exquisite cold water is a consideration of moment and a perpetual delight.

It is surely the oddest little island among islands to be found, this beautiful island of Sark. The people speak an un-understandable *patois* with a Norman-French basis, and yet are British subjects to the core. My old landlady, for instance, speaks no word of English; but the pictures on my bedroom walls are Windsor Castle, Balmoral, and Queen Victoria as a girl. On Coronation Day the enthusiasm rose to fever-heat. The old guns at Eperquerie, Banquette, Pointe Robert, Hog's Back, and Plaisance thundered as loud for their size as any in the kingdom, though they had lain silent in the short herbage of the headlands since George III. was king, and the firing of them was not without its risks. And no bonfires blazed brighter that night than those on Longue Pointe, Eperquerie, and the head of the Coupée in Little Sark. And the fireworks! and the crowds! Why, there were surging crowds of seven and even nine persons in places! And the strains of 'Rule, Britannia!' which greeted every rocket ring in many minds yet.

Sark is a unique specimen of the *multum in parvo*. It might well adopt the words as a motto. It is grandeur and beauty in its most welcome tabloid form. The island is three and a half miles long and from six feet to one and a half miles wide. You can row round it—or be rowed, which is very much better, since hidden rocks and swirling currents abound—in five or six hours, visiting several of the better-known caves, in the boat, in that time; and you can come for eight years in succession, and stay a month each time, and still find the high delight of novelty. I know a lady who came to stay for a couple of weeks, and has been there over twenty years, and I'll be bound there are places in Sark which even she does not yet fully know, though Sark is her delight and owes much to her.

Looked at from the sea, as the *Alert* or *Assistance* carries you across from Peter Port in Guernsey, Sark looks all rugged, treeless cliff and granite bastion, deep indentations, black caverns, with a circling barrier of rocky islets and sharp-fanged rocks on which the long, slow heave of the blue sea churns everlasting foam.

But land on the little stone pier in Creux Harbour, pass through the tunnel which leads to the interior, and you find yourself in a lovely lane, with high, fern-clad banks and overhanging trees, and hedges of blackberry and honeysuckle; and there are many such in Sark. On the steep braes of Dixcart Valley, up above the little stream where the trees cluster thick and dark, grow hart's-tongue ferns by the million; the bracken is beautiful, the furze gorgeous, and useful too as winter firing; the hillsides are dappled with purple heather; blackberries by the ton are ripening fast; the cottage-fronts are thick with yellow roses; here a pink geranium clothes the whole side of a house; and here are tree-fuchsias eight feet high, blue and white hydrangeas in bushes eight feet wide, and wild rhubarb tall enough to stand under and with leaves like a table-top.

I have been asked many times how Sark compares with my first love, Scotland. It is something like asking how a dainty, perfectly appointed yacht compares with an ocean liner. Compress the beauties of Scotland into three and a half miles by six feet to one and a half miles, and you approximate Sark.

I step out of my cottage door into the dewy grass of a morning, and in one minute am master of Herm and Jethou and Guernsey and the western seas; I turn my back on them and cross a field, and there lies the coast of France; I turn to the north, and there is Alderney and the white pillar of The Casquets; and if I turn south, but for the trees and the long green stretch of Sark, Jersey would lie like a blue line on the horizon twenty-five miles away. In a word, life on Sark combines all the advantages

of an ocean voyage with none of the unpleasantnesses. For it is founded on a rock, and no matter how the wild south-wester roars and the great waves crash against the cliffs—and the wilder the better for a time and again—the little island keeps an even keel, the 'fiddles' never appear on the tables to take away one's appetite with ominous forebodings, there are no empty chairs, and every meal is a sweet satisfaction of healthy, craving hunger. The sun is always bright, except when it rains or is busy elsewhere, and every wind that blows is a sea-breeze.

Out there the stately ships press on across the blue-ribbed sea with piles of snowy canvas gleaming in the sun and curls of white at the forefoot. And here, if you wish, are tennis and croquet, but better still the widespread sands of Grand Grève and Derrible Bay, the sparkling rock-channels of Les Fontaines, the lucent depths of Venus's Bath, and the easier path through the ferns and blackberries to Dixcart Bay, beloved of the children, who wake the arches with their shouts and laughter.

'But whatever can you find to do for a whole month in an island three and a half miles by six feet?' you say.

Well, the coast-line, in and out, measures close upon twelve miles, and every inch of it is a delight and worthy of careful study. Here the great stone altars—the Autelets—stand worshipfully, with the green waves creaming up their rugged sides, and the gulls and cormorants nesting in the chinks and crannies up among the golden lichen. And at low-water the rock-pools below them are sheer wonders of delight: seaweeds of every colour, from purest white as fine as thread to golden-brown and purple with phosphorescent points; anemones in thousands, brown and green and pink and red and white, waving their long arms hungrily for food and closing hopefully on your proffered finger like a sucking calf; tiny fishes in myriads flashing electrically this way and that, as if one mind had shattered suddenly into twice ten thousand tiny bodies; limpets and barnacles which freeze audibly to the rock at sound of your approach; chaotic boulders, overhanging cliffs of granite and porphyry, rifted and weather-beaten, strata all awry, and so pendent to their sometime fall that you eye them cautiously before venturing too close.

And everywhere along the coast are giant *chapelles* pierced through and through by the great waves, where you may wander on smooth yellow sand or sit on black-toothed rocks and think yourself in church.

And the caverns! Caverns red and caverns black; caverns green and brown and purple; caverns with floors of rock and floors of sand, and floors only of sweltering waves; caverns gemmed forty feet high all round with gleaming anemones of every imaginable colour, like studded nails in a fortress door; caverns green with tiny ferns which fringe the roof and lofty sides; caverns in which the waves bark hoarsely at you from unseen depths; caverns where you carry lights, and some where the only light comes up, green and shimmering, through the tremulous water below your boat; caverns where you may see the octopus glide stealthily from hole to hole among the rocks; caverns where you lie on the shelving sides—because you cannot stand on your ankle-bones—and gaze with awe on the stupendous slabs which form the roof, and, with relief, out beyond to the twinkling waters of Havre Gosselin and the smacks at anchor there; caverns into which you descend precariously by finger and toe down the face of a sheer black wall of rock, and are grateful to the man who brought a rope, and out of which you climb by a chimney several hundred feet high, and issue into a bit of Doré's 'Purgatorio'!

Oh yes, there is no lack of things to be done in Sark. Pack the baskets, and don't forget the milk and the methylated spirits and the kettle, for tea never tastes so good as just after a bathe! Fill the big Guernsey can with sweet water from the sweetest well in Sark! Roll up the bathing-things! Apportion the loads to the carriers, and off we go through the quiet lanes, with a cordial greeting in French or English from every one we meet or see across the hedges in the fields, and a quaint, singsongy 'Good-morning, sir,' from every chubby-faced child.

Any letters to post? Here is the little post-office, and we shall not be back till long after the post has gone at 4.30. And here is the island weather-glass on the wall opposite. Going up? All right! Here are some of our friends with their baskets and bundles. 'Where are you going this morning?' 'Grand Grève.' 'So are we.' So we all go along together, with the larks bursting themselves overhead, and the gentle-eyed tethered cows watching us thoughtfully and wondering why we are allowed out loose.

Here we are at Collinette and John Philip de Carteret's. A fine old habitant is John Philip—the very image of Leo Tolstoi—pilot, sailor, universal provider, and general father of the island and omniscient friend of all visitors. His well-provided shop and store-rooms will furnish you with everything you need, from Dutch drops, which cure every ill that flesh is heir to, to dress goods, and soap, and candles, and cakes, and picture post-cards, and cigarettes, and books. If you don't see what you want, just ask for it, and smiling John Philip or cheery Mrs de Carteret will produce it from somewhere or order it from Guernsey, and will chalk it up against you; and when your purchases amount to twenty shillings, if you give them an English sovereign they will conscientiously return you one shilling, the benefit of exchange. All the roads in Sark lead to John Philip's, and round his little counter every one in the island meets every one else several times a day.

'Any fruit left, Mr de Carteret?' 'Ach! I am sorry it is all gone. You should have bespoken it last night. I will keep you some for to-morrow.'

'All right.' So we send a detachment off to another fine old De Carteret's—Philip only this time—by the church, and get tomatoes and great black grapes fresh from the vines, and plums and peaches straight from the tree, and the caravan sets itself in motion again. Down into Petit Dixcart, across the stepping-stones, past the Seneschal's fine house, up the green, shady brae, through the fields past Clos Bouret, past Plaisance (where Philip Carré the Greffier lives, and will delight to have a chat with you), and here we are at the Coupée, the wonder of Sark, safe enough now with its five feet of roadway and a railing on each side. But formerly, and even latterly, through landslips, the path was but eighteen inches wide, with a fall of three hundred feet on the one side and almost so on the other, and three hundred feet long, and across it the timid went humbly on their hands and knees.

Under the railings we go at this corner, down a track that winds and twists and falls in chasms. We slip and slide, and in places pass the bundles like fire-buckets from one to another, to be piled in safety at the end of the line, since all our eyes and hands and feet are wanted for our own comfort. We hold on by ivy-roots and tufts of grass in which the furze-needles love to hide and laugh aloud when our fingers are turned into pin-cushions. At the final slope we fling unbreakable bundles down on to the beach, and let down the eatables with tender caution and a rope, and finally reach sea-level unbroken, hot, and panting.

Now, the eatables into the shade, and scoop a sheltered hole for the kettles, all ready to light up at a moment's notice. There is a merry rivalry in kettles. Every one's boils the quickest and makes the best tea. If we can produce boiling water five seconds ahead of our neighbours we gleefully taunt them with the fact and superciliously offer them tea, and condole with them on the poverty of their stoking arrangements.

Then away to the caves and rocks, and in five minutes we are all racing over the sands to the sea like a party of merry school boys and girls. And we swim and sink and dive and float and shout and laugh and play about to our hearts' delight.

London? Never heard of it. Big place across seas where people work themselves to death, isn't it?

Port Arthur? Don't know anything about it. Fighting there? Sorry—much better to be bathing here, don't you think?

Climb on a rock and dry in the sun, and look out for those barnacles or you'll lose cuticle. Then in again and again and again; and back up the beach to get into a minimum of decent attire and light the spirit-lamps.

Tea is ready in five minutes—before the ladies, as a rule. They have hair, you see, and strange predilections in favour of more than two garments.

So we lie about, and eat and drink, and swop delicacies of the commissariat, and smoke and chatter, and are merry—and wise.

The long-necked cormorants wing swiftly to and fro on business bent, and dive at times, and, getting lost among the rippling waves, seem never to come up again; while round and round the seagulls swoop and float and slide on the wind; and up above, a hawk is poised as motionless as a brown leaf nailed against the sky.

Then we seek Sark stones—agates and cornelians, green and red and yellow and brown jaspers, hornstones and moonstones, crystals of hornblende and chalcedony.

And then, for the destruction of our peace of mind, some villain builds a cairn on a distant rock, and in spite of ourselves we cannot rest till it is bombarded to pieces, and the prize shot builds it up again.

Then we ramble off along the shore, scramble over the rocks at the farther end of the Grève, and loiter among the *chapelles* and grottos and fairy pools till it is time to bathe again, and once more the sands ring with merry shouts and laughter; or, clad only in bathing-costume, we wade neck-deep into caverns unattainable in ordinary gear, and taste the novel joy of exploration. And so, in due course, to tea, and more talk and laughter; and before the sun sets behind Guernsey we climb the tricksy path again—three hundred feet down, ten thousand three hundred feet up—and saunter back through the darkening lanes and fields in the quiet gloaming, with no sound in the air but the boom of the homing beetles and the wash of the distant surf. Now and again a rabbit scuttles hurriedly across the path. Through the tunnel of the trees the bats flit noiselessly. From the hedgerows we gather blackberries sufficient for to-morrow's pie, from the fields mushrooms for to-morrow's breakfast.

The caravan disintegrates as the various homes are reached, meeting-places are arranged for the morrow, and we jog steadily along to the far north. And there at last is the lamp in the dining-room at La Tour gleaming cheerily through the trees, and here are letters awaiting us on the table, and here is our smiling hostess announcing that dinner is quite ready—a wonderful woman and a famous cook, and always smiling cheerfully even though, as frequently happens, we are a good hour behind our time.

That is a typical day in Sark, varying, of course, as to locality. Now it is Little Sark and Venus's Bath and Port Gorey, and the Souffleur blowing out spray a hundred feet high; and again it is the Eperquerie and the Lady Grotto, or Derrible with its awful Creux, or Grève de la Ville with its caves and chasms, or the Port du Moulin, or Saignie Bay; and very often it is Dixcart, where the children frolic all day long without danger of drowning or breaking.

After dinner—one of the amazing things about Sark is that you are always hungry and never

tired; it is all in the air, I suppose—you saunter out for a walk, and ten to one find yourself in John Philip's shop, bumping merrily against the friends from whom you parted an hour ago. And maybe there is a concert in the girls' school or the boys' school or on the vicarage lawn, given by the visitors in aid of the Seamen's Shelter on the pier, or towards the piano fund, or the Cottage Hospital in Guernsey. But wherever it is, and whatever it is for, it is all equally amusing; and when it is over we stroll back home under the falling stars, with the guardian lights winking all round the horizon, hearts at peace with all the world, and grateful for Sark and all that it means to us.

And it is all within such easy reach of London. A smooth, quick run in the famous Great Western express, through Pewsey Vale and Savernake Forest, takes you from Paddington to Weymouth in four hours, and another four and a half hours on one of the same company's finely appointed steamers lands you in Guernsey in comfortable time for dinner. This route gives the maximum of comfort, both on rail and steamer, combined with the shortest possible sea-passage, which is a matter of consideration to most folks. The course of the Great Western steamers also lies well to the west of The Casquets, whose ill-repute, to my surprise, I have more than once heard advanced as a reason for not going to the Channel Islands.

The night in Guernsey breaks the journey pleasantly, and enables you to get an impression of quaint old Peter Port and St Sampson's, and, above all, to visit Victor Hugo's house, which alone is well worth the journey from London. The old oak carvings and the tapestry, with which every room is walled and ceiled, are very wonderful; the glass study on top of the house, where *Les Misérables* and *The Toilers of the Sea* were written, the great balconies, the gardens and vineries, are all charming and tend to the straining of commandments. The Sark steamer leaves at ten o'clock next morning, and a short hour's run past Herm and Jethou lands you at your desired haven, among smiling brown faces and the easiest of costumes and manners. You are already half-friends with every one you meet, simply because you have the good taste to come to stay in Sark.

And as to ways and means. There are in Sark two comfortable and well-managed hotels—the 'Dixcart' and the 'Bel-air,' where you can put up for seven-and-six a day, with special terms by the week. Every cottage takes in visitors, and most of the residents let their houses for some part of the summer months. Ten shillings a room is a customary price for lodging and service, and the commissariat department runs to what you please—for twenty-five shillings a week you can live in clover.

There is something in the air of Sark that promotes good fellowship as well as health and hunger. I never heard one unpleasant word during a month's stay. As on shipboard, you make acquaintances rapidly. Every one is happy, and desires your happiness, and especially that you shall enjoy your visit and come to love Sark as he or she does.

There is a freemasonry and bond of union in the very word. Meet a busy man in a Midland town, or even in lonely London, and though you never met before, if he loves Sark and you love Sark, you strike hands and are friends.

Au revoir, Sark! *À bientôt!*

GIANT CIRCUMSTANCE.

By JOHN OXENHAM, Author of *Barbe of Grand Bayou, Bondman Free, John of Gerisau*, &c.

CHAPTER XVII.—AS BY A MAGNET.

A COUPLE of days in town, a call on the Grand Duke, an evening with Nell and Charlie, and one with Trevor at Grattan Street, and Geoff found himself in the studiously depressing atmosphere of the staff college at Farnborough.

With his labours there we are not concerned, except in respect of this one fact. He worked hard; but whether he was reading in his big bare room, or galloping along the sandy ways among the pines and firs, or out surveying, or grizzling under tormenting examinations and the still more torturing anticipations of them, ever and again there would look out at him, from printed page or written paper, or from dusky roadside covert, a beautiful, high, proud face, and a pair of dark eyes, filled with scorn and detestation, and much more besides.

I am not sure that that face did not spur him on his way. It seemed to despise him. He would show it what was in him. It seemed to detest him. That he could not understand; but within him there began to grow a desire to persuade it otherwise.

His off-Sundays he spent as a rule with the Exmoors in town, and whenever he could get a week-night free he ran up to spend it with Colonel Trevor and in Grattan Street.

The work there was going strong. Results were visible even in this short time. The sight of those boys' faces and already bracing figures repaid Geoff and the others a hundredfold for the little they had done for them.

Exmoor and the Grand Duke were down pretty frequently. Colonel Trevor had made it his hobby, and was renewing his youth in it.

So well, indeed, was the purely secular work progressing, and such a hold had they got on the raw material, that, at Ellen Exmoor's instigation, and in spite of Captain Dicky's pronouncement against preaching, they decided to open Headquarters on Sundays also, and, with the best assistance obtainable, and by the most unobtrusive and non-preachy methods, to attempt a still higher uplift in those opening lives.

As Ellen pertinently said, 'All you are doing is so very good! It would be a pity to stop short of the very best.' And she was right. The seeds sown in Grattan Street have borne rich fruit in many odd parts of the earth.

Geoff forethoughtfully invested a sum large enough to cover all expenses in the names of Trevor and Exmoor as trustees, in case anything untoward should befall himself. And with great gusto, under Nell's presidency, they designed a uniform—cap, tunic, and belts—which nearly sent the boys off their heads when they were allowed to pronounce upon the first-made specimen. A bandmaster was engaged, instruments procured, volunteers selected, and march-outs loomed large in the near future. But even in the tumult of Grattan Street, with its swarms of youngsters who knew no rest, those scornful dark eyes and that high, proud face still looked out at Geoff from the most unlikely corners, and held him captive to their puzzling spell.

To his staff college work he brought a great natural aptitude for learning, the advantages of actual experience in the field, a very great desire to justify the Grand Duke's friendly encouragement, and perhaps an unconfessed intention of proving to Black-eyes that he was worthy of something more than kicks.

That was purely sentimental, of course, since he never expected to see her in the flesh again. But sentiment, after all, is one of the great world-forces, and therefore to be reckoned with.

He passed his December examinations brilliantly, and then was his own man for a time. Exmoor and Nell were in Cairo. He had half a mind to join them. On second thoughts he had had enough of Egypt for some time to come, unless in the way of business; and, besides, they were to be home before Christmas and might already have started.

After three days in town, with sudden decision, having known full well all the time that that was what he wanted, he wired to Donald Cameron that he was coming up to Innismohr, and two days later he arrived there in company with Tom Brading and a couple of portmanteaus and a pair of acme skates, with hopeful recollections of the lonely loch among the hills.

The workaday cutter and old Donald were waiting for them at Innischeil. Geoff got them to take him across to the island, and sent Brading and the baggage round in the boat.

He had left London smothered in mud and swamped with rain. Their springless cart the night before had travelled softly over snow. When he looked abroad in the morning, the world was white and sparkling, and the Innismohr hills across the Sound, which flowed the darker between, were almost overpowering in their soaring majesty. They were mighty links between two worlds. Below, their swelling muscles, at once masked and outlined by their scant, wind-swept covering, gripped earth with ponderous vigour; above, their snowy crowns shone white and dazzling in the thin, pure air of the heavens.

When he took his way up the glen the snow lay waist-high on the bracken on either side; but, to his surprise, a well-trampled path led straight up to the corrie, and over the hill-shoulder, and along the side of the dappled loch towards the glen.

The loch was frozen over its whole length. Here and there the snow lay in coils and wreaths and long white swaths, but in places the wild winds tearing down the glens had swept the surface bare, and there the ice lay black and sullen. All along the hillsides the pines and firs stood in their ranks like a silent white-coated army. Not a thing moved; not a sound broke the solemn stillness of the long white valley.

That trampled path puzzled him. He followed it into the glen, and noticed that a similar beaten path joined it from the other side of the loch.

The glen was, if possible, even more wonderful and fairy-like in its winter finery than when he saw it first. Such tapestry of frozen creeper; such filamental lacery of frozen threadwork; such feathery frosting of every twig and tuft of moss! Every rock-shelf over which the stream still leaped was a reversed sheaf of sharp-pointed spears. The tapestried rocks were bossed with gleaming nobs and points. But his mind was full of the puzzle of the trampled path, and he followed it downwards.

He had to look warily to his footing, for sprained ankles lurked plentifully on that steep rock-path, with its covering of trampled snow. In the very act of springing from one safe foothold to another, one time, he got a sudden, strange impression of a face in front—a fleeting mental snapshot, as it were, between two blinks of the eye. He could not have sworn that he saw anything at all, and yet the feeling was strong upon him that he had seen something, something like a dark, surprised face, something utterly incongruous to all its surroundings.

He came out suddenly on a wind-swept terrace, running to right and left along the mountain-side. The glen cut through it and went wandering downhill. The trampled path seemed to stop there, but the terrace was bare of snow and bore no testimony.

He turned to the right and strolled along, looking down with appreciation on the snow and frost magic below, and far away below them the blue sea smiling

in the sunshine. And presently he came to a small opening in the mountain-side, like a narrow Gothic doorway. He stood looking down a long black tunnel. It was perhaps three feet wide and six feet high, and it seemed to run right into the bowels of the mountain. A tiny stream trickled out over the terrace and disappeared over the outer edge. Two narrow iron rails, rusty and water-bitten, ran into the hole, and he judged that it was some old mine-working, experimental probably, evidently abandoned.

He struck a match and looked in, but saw nothing more than damp, rough-hewn walls, and the tiny tram-rails vanishing into darkness, and the stream trickling slowly between them. He stooped and balanced himself on the rails, and stepped gingerly in. It was damp and tomb-like, and he felt doubtful of the wisdom of proceeding. Still the rails led on, and he struck another match and followed. He heard the slow drip-drip of the falling drops, and the side against which he balanced with one hand was slimy and icy cold. An inhospitable drop put out his match with a sputter. The heavy darkness which momentarily settled on him quickened his other faculties. He could have sworn to a slight sound other than falling drops in the Egyptian darkness ahead.

'Rats!' he said to himself, but struck half-a-dozen matches in a bunch with suspicious quickness, and held them up and peered ahead. And again he got the impression of an alien sound and half an impression of a shadowy movement among the shadows.

Faugh! the place was uncanny. Even a horde of rats would be no pleasant company in such a hole. He turned and crept back to the starry point that marked the entrance, and laughed—when he got there—at a confessed sense of discomfort about the nape of the neck during the passage.

He strolled back and went a short way along the left-hand terrace; but presently it dwindled into the sheer hillside, and he turned and climbed back up the glen. And as he climbed, his mind was full of the sweet-voiced yodeler whom he had met the last time he was there, and who had been so much in his thoughts ever since. He wondered if she were still on the island, and if she would kick him with her great dark eyes again if they chanced to meet, as she had done that other time.

He tramped on round the loch, and never set eyes on a soul until he came down through the glen to the village and the sea.

(To be continued.)

CANDLES, OLD AND NEW.

THE most prosaic things will often be found upon examination to have had at some time much romance hanging around them, and even such an ordinary article of domestic use as a candle has a most interesting past. At a very early period in the history of mankind fire and light were invested with celestial attributes, and the candle especially has been associated with worship even up to the present day. It is not surprising that this should be the case, for the burning of a candle, until the foundation of modern chemistry, must have presented a great mystery. A solid substance is seen in it to gradually disappear, to evaporate, while at the same time light, which is naturally associated with life and all that makes life worth living, is created. The candle is the emblem of the grosser part of matter changing to the ethereal, and it has taken part in religious festivals all the world over for untold ages.

It is impossible to say at what date candles were first used. There are many scriptural references to them; but the words 'candle,' 'candlestick,' and 'lamp' are used indiscriminately in our translation of the Bible, so that we cannot differentiate the one from the others. A Latin author, Apuleius, shows that in his time (A.D. 174) candles of wax and tallow, torches of pine, and lamps were all in use; before that Pliny had recorded that the Romans used wax candles in certain sacred rites; and we now know that at Herculaneum has been found the apparatus of a chandler's shop.

We may be sure that the candle, like other things, was the subject of slow evolution, and its parent was undoubtedly the torch—a mere splinter of pine-wood with resin oozing from its pores. Then would follow the link, a better sort of torch, consisting of rope covered with pitch or resin. Middle-aged Londoners can remember that such torches were sold in the metropolitan streets on foggy days when the thoroughfares were not so brilliantly illuminated as they are now. Going back still farther into London's chequered history, we are reminded by the huge extinguishers which still protrude from the ironwork surrounding some of the old doorways, that footmen and link-boys ran with torches in front of the carriages of the well-to-do—a necessary precaution at a time when the streets were dimly lighted by oil-lamps.

Next came the flambeau, a superior sort of torch, which had a central core of oakum surrounded by layers of resin and crude beeswax. Here we certainly have the germ of the candle, if it had not long before been suggested by the accident of grease from some cooking operation flowing over and coating the sticks which served for fuel. Tallow and beeswax are two natural substances which present themselves for candle-making, one for the use of the poor and the other

for the rich. Time was, indeed, when a man's social status might be gauged by the material of which his candles were composed. The convenient and highly decorative electric glow-lamp has ousted the wax candle, and it would be difficult to find a house where wax is now used.

As a matter of interest it may be mentioned that one of the last public places in London which was lighted by pure wax tapers was the Chapel Royal, St James's Palace. These candles, which were about a foot in length, were used for the Sunday evening service, lasting forty-five minutes, and were never used twice. The scarcely shortened candles became the perquisite of the chapel officials, and even the members of the choir carried away their particular tapers after service.

Like all other manufactures, that of candles began in a humble way—they were made by hand in that hap-hazard, unscientific manner which is commonly expressed by the term 'rule of thumb.' Reference to the pages of an encyclopædia which bears date 1819 will show us in a moment how candles were made at that date. We are told there that a candle consists of a cotton or linen wick loosely twisted and covered with tallow, wax, or spermaceti; that a good candle should consist of an equal mixture of bullock's tallow and sheep's tallow; that the fat of hogs will make a candle gutter, and will make it emit a black smoke and an evil smell. Then we are instructed in the method of making the candle, and are told how the tallow, having been melted, is allowed to stand for a few hours to settle, after which the wicks are immersed again and again until the candle grows to the required thickness.

Wax candles—which, we read, were chiefly used for churches, processions, funeral ceremonies, and the like—were made differently. Melted wax was poured from a ladle on to the suspended wicks until the candles grew to the necessary thickness; they were then transferred to a 'feather bed' to keep them warm, and were subsequently rolled to form on a flat table.

It will thus be seen that very little science entered into the business of candle-making up to the second decade of the last century. But a clever French chemist, Chevreul by name, had for some years been working in his laboratory with a view to determine the nature of fatty bodies. He gave his results to the world in the year 1823, and earned the title of 'the father of the fatty acids;' for he showed that all the neutral fats of commerce, such as tallow, coco-nut oil, cotton-seed oil, and many kinds of grease, were not simple organic substances, as had been previously supposed, but were fatty acids in combination with glycerine. Glycerine, it may be remarked, was discovered by the Swedish chemist Scheele in 1779, who called it 'the sweet principle of fats.'

The researches of Chevreul placed the manufacture of candles upon an entirely new basis, and 'rule of thumb' had to give way to 'rule of head.' He showed that by separating the glycerine from the fats, the substance left, now known commercially as stearine, was not only firmer and whiter than the original fat, but was in every way better adapted to candle-making. Moreover, the glycerine, once regarded as a waste-product, has since become highly esteemed as a valuable aid in medicine and in the arts. An attempt was made by Chevreul himself, in partnership with Gay-Lussac, to start a candle-factory under the new conditions; but the enterprise failed, and the first to succeed in the work was a Frenchman, M. de Milly, who, by a modification of Chevreul's methods, placed stearic acid candles on the Parisian market which were priced at two francs per pound. From this it may be judged that the new process, however efficient it may have been, was by no means cheap in execution.

No great advance took place for the next two decades; but in 1842 we find several English chemists at work upon the problem of producing fatty acids from cheaper materials than tallow. It was found that sulphuric acid acted as a decolouriser and deodoriser of dark and strongly smelling fats; so that from the most nauseous and unpromising materials—bone and skin fats, and malodorous grease of all kinds—a firm, white, inodorous material could be obtained at a moderate price, and thus was laid the foundation of a big industry. The 'stearine' or composite candle soon became known throughout the world, and was without a rival until the year 1850, when paraffin-wax came within reach of the candle manufacturer. This beautifully white solid substance, somewhat like spermaceti in appearance, was originally obtained from the distillation of coal, but later from petroleum. It is now produced in large quantities in the United States, in Scotland (from shale), and in Burma, the total yearly output being estimated at not less than one hundred and twenty thousand tons. Much of this finds its way to the candle-factories; and although paraffin is too soft by itself for candles—especially those intended for warm climates—when it is mixed with stearine in certain proportions an excellent material is obtained. Such candles are known as 'paraffin composites,' and the material is also largely used for the making of 'night-lights.'

There are persons now alive who can well remember the time when the 'snuffers' and 'snuffer-tray' were regularly placed upon a dinner-table by the side of the candles, and unless those candles were snuffed at frequent intervals they smoked and emitted a nasty smell. This was obviated by the introduction of the plaited wick, a wick so made that it had a tendency to bend outwards, so that it met the air on the borders of the flame and was completely consumed. In the evolution of the perfect candle, as much attention has been paid to the nature and material of the wick as to the composition surrounding it.

Many of us will be apt to think that, because in our cities and towns we see the streets and

shops brilliantly lighted by gas and electricity, the candle manufacture is doomed, and that in the near future candles will be seen only in museums as interesting relics of the past. We are all influenced by our environment, and because we may happen to dwell in some busy centre where more modern methods of artificial illumination prevail, we lose sight of the circumstance that there are still in all lands hundreds of thousands of towns and villages where gas and electricity are unknown, and where candles are still largely used. And let it be remembered that a candle, so far as it goes, is a most convenient light-giver. It is a veritable gas-works in itself, with the power of turning into inflammable vapour the solid matter of which it is composed, without the help of pipes, retorts, purifiers, or other cumbrous plant. It is certainly the most self-contained of all artificial illuminants, and in spite of the coming of more brilliant rivals it will certainly hold its own for a long time to come.

If any one has doubts as to the present popularity of candles, he would do well to visit one of the large factories where they are made, when he would get some idea of the present daily output of these light-givers. Such a visit the present writer lately paid to the works of Messrs Price & Company, Battersea, London, which cover an area of eleven acres, and may be regarded as the finest factories devoted to this industry in the world. It is only fair to state that most of the important improvements in the making of candles have been discovered and carried out in this busy factory on the banks of the Thames. The company have established another factory at Liverpool, the port to which the palm-oil comes, where that product is treated for candle-making; but to the premises at Battersea we must confine our attention.

Although most of the candles we see used are moulded, the old dipping process is still employed, and here we can see it in full operation. The 'dip' is too convenient a form of light to be given up, and seems to be preferred to any other kind of illuminant by certain craftsmen. One reason for this is that its broad wick gives a good flame which is not easily blown out by a passing gust of wind. The cobbler likes to work by the light of a 'dip;' so does the miner, who finds that it will stick in any crevice in the wall, or in his hat, as no other light-giver will. So the 'dip' is still made in huge quantities, while its quality is improved by the substitution of stearine for the raw tallow previously employed.

But to watch the manufacture of candles of the better sort we must proceed to another department. Here is a vast hall full of steaming vats containing a mixture of stearine and paraffin. We see these two solids being brought in trucks to the side of the vats and placed therein in certain proportions; then the steam is turned on, and they are left to melt and combine. Later on, the hot liquid is drawn off into tanks on wheels, and is taken to the candle-moulding room.

The candle-machine is a most ingenious apparatus, but difficult to describe. It consists of about one hundred metal tubes or moulds arranged in rows in a casting-box. Below each tube is a reel of wick, and this wick is held rigidly in its centre. The tender of the machine comes along with a large can of melted composition, which he empties into the casting-box, thus filling all the moulds at once; then he turns a tap which causes water to circulate round all the tubes, so that their contents quickly become solid. A crank is then turned, and the candles are pushed up from the moulds, the wicks depending from their ends. The moulds are now ready to receive a fresh charge of composition, the candles above serving as wick-holders for the new batch of candles. When these latter are ready for raising, the wicks of the first lot are cut off and the candles removed to the packing-room. And so the work of candle-making goes on unceasingly and at a prodigious rate. Let it be noted that this is a brief description of the making of only one kind of candle in a factory where many different sorts are manufactured: twisted candles, fluted candles, giant candles for altar use, scented candles, painted candles, and stained candles. Among the last we noted with interest some bright-scarlet light-givers which were destined for the Chinese 'feast of lanterns.'

There is so much to be seen in this huge and busy hive that we cannot stop long in one department. The cardboard box and night-light case-making room, where the deft fingers of dozens of girls work with lightning speed, claims our attention for a moment, and we presently see how the cases are fitted with wicks and subsequently with their blocks of composition. There is also a variety in night-lights, and as much care has been expended upon perfecting their composition and their wicks as in the case of candles.

Candle-making and soap-making are industries so nearly allied that they go hand-in-hand, and at Battersea a large area is given up to soap. It would take us too far from our subject to deal with this part of the factory, which in itself is full of interest. We have been obliged to confine our attention to candles, and, as it is, have but touched the fringe of a very large subject, for the London Directory alone has a list of over thirty candle-makers. Prominent in the list are other famous makers, such as J. C. & J. Field (Limited), manufacturers of osokerit and self-fitting candles; the Broxburn Oil Company; and Young's Paraffin Light Company. In spite of the introduction of gas, of the cheap paraffin-lamp, and later on of electricity, candles are plentifully used all the world over, and not a few of them are made at Battersea.

SOCIAL PIONEERS OF SCIENCE.

By T. H. S. Escott.

'I CARE nothing about *homo*, Huxley, except as a creature of historical tradition.' 'And I, Hannay, care nothing about *homo* except as a compound of gas and water. But if you and I were better educated men than we are, we should know how to respect each other's studies more.' Such was the little fragment of dialogue between two typical representatives of different intellectual cults which (being in their company) the present writer happened to overhear on the steps of the British Museum some time during the sixties of the last century. The *Edinburgh Courant* had been founded in the Whig interest by Daniel Defoe. More than a hundred years later it became a convert to the picturesque and feudal Toryism of Sir Walter Scott; under that dispensation it had as its last editor of any considerable distinction the clever littérateur who wrote two sparkling novels of the Captain Marryat school, *Eustace Conyers* and *Singleton Fontenoy*. Hannay's admiration of 'blood' as an historic force was only less fervent than that of the weak-eyed young man who, at Mr Spenlow's feast in *David Copperfield*, took 'Hamlet's Aunt' in to dinner; his 'blood and culture' enthusiasm was the subject of many jokes. James Hannay also showed himself a spirited historian of the unphilosophic and pictorial sort in his book on the Gurney family, signally combining, as that did, honest reading and original thought with a fine literary instinct and a natural aptitude for happy expression.

Hannay's place in *belles-lettres* may be compared to that of another ex-sailor, the Frenchman best known by his pseudonym, Pierre Loti. Both men prepared themselves for the profession of authorship while they 'occupied their business in the great waters.' Each, under not entirely dissimilar circumstances, prematurely quitted a nautical life. The earliest writings of both are suffused with local colour, drawn from their maritime experiences. In literary criticism and on literary subjects generally, Hannay made his mark, not only as a Quarterly Reviewer, but elsewhere on the periodical press; his *Satire and Satirists* brought him a request from Thackeray that he would annotate a new edition of the *English Humorists*. 'Written by Gentlemen for Gentlemen' was the description said to have been given by Hannay to the London newspaper to which he was attached before going as consul to Barcelona, where he died in 1873. Hannay may have gloried in the phrase, but it was not his. The words occur in the prospectus of the imaginary *Pall Mall Gazette* of *Pendennis*, written by 'Captain Shandon' in the Fleet Prison. Hannay received his consulship, not from the fourteenth Lord Derby, whose literary as well as racial qualities he adored, but from his son, the Foreign Minister whose accomplishments Hannay had himself described as belonging to the 'mechanics' institute order.' The boast of that statesman's father that he belonged to the pre-scientific age might have been truthfully echoed by Hannay himself. This fact contains, indeed, the sum and point of the conversational fragment quoted above. After practically grounding himself in medicine at Charing Cross Hospital, Huxley, on board the *Rattlesnake*, practised as a surgeon in the same fleet in which Hannay had served as a midshipman. The two men, separated by an interval of only two years, began their London careers about the same time. Though not in equal degrees, both at the date of their British Museum conversation were among the men of the time.

The popular taste for Addison's and Steele's essays was the product of the coffee-house. The French traveller Thevenot, in the middle of the sixteenth century, brought from Constantinople, where the first establishment of the sort existed, the idea of the coffee-house to Paris. Before then, however, the institution had been firmly planted, not in London, but in provincial England. Among the undergraduates of Balliol College, Oxford, in 1641 was a certain native of Crete, by name Nathaniel Canopus, who could not stomach for breakfast the small-beer which was then the morning tipple of the place; he produced a tin of coffee given him by a Syrian friend. A college scout of the period, having brewed the beverage for his employer, tasted it himself, found it very good, and gave some to his friends in the buttery below. The fame of this most excellent substitute for the college ale reached the Master and the Fellows, who, between 1645 and 1650, discussed cups of hot and fragrant Mocha round the Balliol common-room. While Canopus was revealing the new drink to the college of Wycliffe, an Oxford townsman, a Jew named Jacobs, was opening the first coffee-house possessed by England as nearly as possible on the spot now occupied by the London and North-Western Railway Station. The keeper of that place of entertainment retailed the berry in its best quality for consumption off the premises; probably he had supplied the gownsman Canopus when the stock brought by that gentleman from eastern Europe began to run short. Canopus seems later on to have entered into a sort of partnership with the coffee-selling townsman; for, during the second half of the seventeenth century, Messrs Canopus & Jacobs were appointed purveyors of coffee to a little club of scientific Oxonians presided over by Dr Wilkins of Wadham, and meeting twice or thrice a term in his rooms.

This little coterie was known by the name of

the Philosophical Society of Oxford. Amalgamating with London savants, some of whom, like Wilkins and his friend Wallis, soon afterwards settled on the Isis, it formed the nucleus of the Royal Society. Both at Oxford and in London, whatever the place of meeting might be, the scientific usefulness of the gathering was extended by its investment with social attractions. Solid refreshment was not furnished, but an abundant and gratuitous supply of their non-intoxicating beverage was provided by Messrs Canopus & Jacobs. The intellectual temper of English society seems to have been scientific rather than literary till quite late in the Georgian era. The 'First Gentleman in Europe' had been trained in an atmosphere of the conventionally classical and literary kind. The wits whom he had gathered round him at Carlton House or the Brighton Pavilion resembled their royal patron in disliking any intellectual exertion which might bring into play a new set of muscles of the mind. Charles James Fox, indeed, to do him justice, possessed a good deal more than merely the clever schoolboy's familiarity with Latin and Greek. Samuel Johnson learned Dutch late in life as something to 'grind his mind upon.' Fox, like his royal master, would have shirked any such disciplinary use of linguistic study, and, in fact, so detested whatever involved abstract thought that he would not take the trouble to read so epoch-making a book as Adam Smith's *Wealth of Nations*, or even to understand the rudiments of English finance.

Droll as it seems, the prejudices and partialities of the macaronis and fribbles of the Regency period had something to do with setting the intellectual fashion for many years after the very nicknames of these dandies were forgotten. The Court under George IV., and to some extent under his successor, reflected the literary temper of the rakish Whig leaders. The fourth George himself knew almost as much about Theocritus and Virgil as his favourite statesman. An educational reformer, incredibly in advance of his time, happening to find himself at Court on the day that Dr Keate had been sent for to Windsor Castle, hinted to his Sovereign that the Eton boys might receive occasional lessons in the applied sciences. The Sovereign frowned disapproval on the presumptuous suggestion; the head-master characteristically barked out in an undertone that he should have liked to flog the man who made it on the spot. Neither the king, however, nor the arch-bircher could prevent or ignore the fact that the social tide was setting in favour of science as a recognised part of English culture. After the Royal Society for Advancing Natural Knowledge (so styled in 1662 by its founder, Charles II.) had ceased to meet at Gresham College, it found its headquarters at Arundel House. A member of its host's family presented it with a valuable library. Other donations and legacies followed. It began to be a wealthy corporation. In 1710 it was domiciled in a house which it had purchased in Crane Court.

Long before the eighteenth century had come to an end polite patronage had done much towards assuring for a knowledge of nature and its laws a recognised place in the educational course. Richard Lovell Edgeworth (1744–1817), by his turn for mechanical inventions, was led into deeper inquiries as well as into an intimacy with Dr Darwin, the great scientific pioneer of that period. Edgeworth impressed on his daughter, the more distinguished Maria, the value of natural philosophy as an instrument in training the youthful mind. Miss Edgeworth's novels and stories, without professedly fulfilling any scientific mission, are written in a scientific tone, and in innumerable passages, as much by what they suggested as by what they said, were calculated to stimulate a popular interest in physical inquiry.

A relation of the Edgeworths, honoured as a west of England worthy, Thomas Lovell Beddoes, is still locally, if not nationally, remembered as an active propagator of the new learning. Dying in 1849, he must in life, to judge from his portraits, have looked like the prose original of Dr Dulcamara on the burlesque stage. His habitual costume was nearly that worn by Toole in the part of Paul Pry. The chief interest attaching to Beddoes comes from the fact that in his 'pneumatic institute' at Clifton he had for his assistant a Cornish lad fresh from a Penzance surgeon's dispensary, Humphry Davy. Coleridge and Southey, then often in the neighbourhood, were the most interested and regular witnesses of his experiments. 'That boy,' said Coleridge, pointing to the future inventor of the safety-lamp, 'will go a good deal farther than his master.' Southey's observation of natural philosophy incidentally proved more useful even than Coleridge's. Southey, indeed, did not become a real power on the *Quarterly Review* till some years after his first acquaintance at Clifton with Beddoes and Davy. But in John Murray's Albemarle Street parlour he was in the habit of meeting the editor Gifford, as well as his chief writers. These latter affected a contemptuous indifference to physical science in all its branches. Zinc wire, gas, water, and liquid manure were said by George Canning the Minister, as by his friend and literary collaborator Hookham Frere, to be the only matters on which science could possibly help its votaries. Fresh from his Clifton experiences, Southey had the courage to differ from his editor and his associates. 'This new knowledge,' he said to Murray, 'is steadily creating a new literary demand that must be met.' The remark was soon followed by condescending references to natural inquiry in the *Quarterly Review*, and by the publication of popular handbooks on natural philosophy, and so forth.

The opening of the nineteenth century saw Davy's lectures at the Royal Institution animate London with an enthusiasm for the subjects on which he discoursed. Gradually the savant became a lion in society as well as a teacher in the lecture-room.

First Sir Humphry Davy, then his pupil and assistant Michael Faraday, were in high request for fashionable drawing-rooms. Lady Blessington did not consider her Gore Lodge receptions complete without one of her open-air philosophers, as she used to call them. Fugitive pieces on more or less scientific themes now commenced to mingle with the literary contents of the keepsakes and albums edited by ladies of quality, like Lady Blessington herself. The exquisites of the old literary caste did not like it. Hence the words attributed to Count d'Orsay when some one spoke to him about vegetable products: 'Yes, I think I once took a pea.' About this time, too, certain associations of personal romance really operated as pioneers of science with the public. There has come up a second 'lion out of Judah:' so said Charlotte Brontë, who had already given the leonine description to Thackeray on the first occasion of her seeing Michael Faraday. The facial resemblance between the novelist and the philosopher was remarkable. The dramatic vicissitudes of Faraday's life; the simple beauty of his character; above all, perhaps, a general impression that his chief, Sir Humphry Davy, now very prosperous, and some thought rather pompous, owed to his pupil more than he cared to acknowledge, had created a deep interest in the great electro-magnetic researcher, who had begun life as a bookbinder's boy in a back street of the West End.

When the present writer's London life began, a little more than a generation ago, the talk in literary circles often used to go back to the weekly gatherings held over a publisher's shop in the Strand. These premises belonged to the Chapmans, who were the first publishers of the *Westminster Review*. Mr Herbert Spencer then wrote for the *Daily News* and for a little weekly paper owned and edited by his friend Edward F. S. Pigott, whose interest in all departments of intellect was as comprehensive as it was keen, and who is known to the present generation as the late censor of plays. Hither also came George Henry Lewes; it was the talk heard by him here which put into his head the notion of a history of philosophy written from the severely scientific point of view. Here also Lewes met Mary Ann Evans for the first time. At the Chapman gatherings, also, the lady herself contracted her earliest intimacy with science, a taste for which, growing with her mental growth and strengthening with her mental strength, did not perhaps prove entirely favourable to George Eliot's literary art. But here it may be pointed out that long before the *Scenes of Clerical Life* announced the advent of a new genius of the pen, the leaven of scientific thought and diction had begun in Charlotte Brontë's novels to influence contemporary letters.

On Michaelmas Eve, 1868, died Henry Hart Milman, Dean of St Paul's. I recall the exact date because not many days previously I had made my début as a London diner-out at his hospitable board in the Deanery. The most interesting, as well as the best, talker among the guests struck me, I remember, as being the geologist Sir Charles Lyell, then just a septuagenarian, with a manner made up of urbanity and distinction. 'I have,' he said, 'just returned from a visit to Oxford, where I find the undergraduates are educating themselves to believe that the Jews, possessing a genius for religion, just as the Greeks had for literature or art and the Romans for law, invented the whole contents of the Old Testament first, and of the New Testament afterwards.' The blending of the personal and the anecdotal with the scientific in Lyell's conversation at Dean Milman's table was singularly happy and delightful. I happened to mention a recent visit I had paid to Paris. 'Ah,' said he, with, I thought, a stronger Scotch accent than he had yet used, 'Paris is well enough in its way; but, as my old friend Robert Chambers, quoting one of his countrymen, used to say, "For pleasure give me Peebles."' This remark led to another about the anonymous *Vestiges of Creation*, whose appearance had been one of the sensations previous to my own birth, and, from a literary point of view, certainly comparable with that excited by the nameless Waverley Novels. 'It was,' said Lyell on this occasion, 'one of those works that mark eras. Without it the public mind would not have been fitted to receive Darwin's *Origin of Species*, published fifteen years later.'

Lyell knew that I came from a west of England stock. 'We have each of us,' he went on pleasantly to say, 'something to be proud of from the physicist point of view. Humphry Davy the Cornishman, and Andrew Crosse the Somersetshire squire with a turn for electricity, were not less necessary to what is known now, and above all to the popularisation of that knowledge, than were my own two compatriots Hugh Miller and Robert Chambers.' Andrew Crosse of Broomfield had gone long before my entrance into this world; but his personal fame, in my childhood, lived in his county and mine. I myself have seen, in the grounds of his former house in the Quantock country, the electric wires, attached by him to the trees, conducting illuminating streams beneath his roof; thus by a distinguished man in a remote region was the electric light anticipated in the heart of an unscientific age. On this occasion of my meeting him, I think I understood Sir Charles Lyell to say he had actually heard Andrew Crosse make his famous prediction: 'I prophesy that before the middle of the nineteenth century we shall be enabled to communicate our thoughts instantaneously with the uttermost ends of the earth.' There were many social prejudices for Crosse to overcome. Something more than a suspicion of uncanniness attached to his pursuits. His humbler neighbours, even the domestics of his own household, looked askance at his workroom as the chamber set apart for his assignations with the powers of darkness. His neighbours in that exceedingly Tory countryside

looked upon physical science in any shape as a dangerous mode of destructive Radicalism, somehow connected with and growing out of the French Revolution. No man in his generation did more to disarm these prejudices than Andrew Crosse, and to reconcile the genteel philistinism of his generation to the study of natural agencies as a blameless, and possibly even a beneficent, branch of knowledge.

Huxley, of the square, straight figure, the fine brow, the clear and remarkably expressive eyes, in other ways than by his historic appearances at the British Association meetings or his work at the School of Mines, socially befriended the cause of natural knowledge. A better writer than he was speaker or talker, he showed for the first time that a man might give his best years and energies to physical inquiry and yet yield to few of his contemporaries in purely literary accomplishments and distinctions. Something of the same sort, though of course in a much less degree, may be said of a clever writer not long since dead. While at St John's College, Oxford, H. D. Traill, as a student of the Humanities, was a favourite pupil of the rhetorician and metaphysician who eventually succeeded Milman as Dean of St Paul's. H. L. Mansel, besides being a philosopher, had an extraordinary gift of literary parody and caricature. Traill was the disciple to whom this teacher most signally imparted his own most attractive acquirements. Yet Traill, having taken a first-class in the purely classical school of Moderations, directly the academic course left him free to choose his studies, went in for the Natural Science School. That school, throughout the sixties of the nineteenth century, was a comparative novelty; it owed existence and early popularity to the geological professor Phillips, to Sir Henry Acland, and particularly, I should say (looking back on my own experience), to the stout presence, the strong mind, and the genial bearing of George Rolleston. 'Bones and stinks' was the unflattering vernacular by which unscientific youth indicated this new branch of learning. The men just mentioned, whether as successful students or as persuasive teachers, popularised it with a rapidity which fifty years ago none foresaw.

With another Oxford savant, Henry Smith the mathematician, Fellow and Tutor of Balliol, must be associated the recent great increase in the attraction to intellectual persons of scientific study. In 1842 Darwin seriously prepared for the great work of his life by settling at Down; his house became the social rendezvous of able and thoughtful men of the world, who found refreshment from their secular labours in the company and pursuits of their host and teacher. Conspicuous among these visitors were Sir John Lubbock and Sir Mountstuart E. Grant Duff. Eventually the former became Darwin's neighbour by settling at High Elms, Farnborough; the latter, after some rural migrations, bought the Orleanist villa, York House, Twickenham. The two men took the same interest in the entire world of physical phenomena; they were frequent visitors at each other's houses; they received an equal number of cultivated guests beneath their own roofs. The Lord Avebury of to-day has never lost in the philosopher the easy and agreeable manner of the polished Etonian. Grant Duff, more recently the Governor of Madras, always united with his scientific interests a knowledge of the inner life of politics and personal ways of statesmen, which made him the most entertaining or instructive of hosts, not less than, in Dr Johnson's phrase, 'the most clubable of men.' Mr Gladstone was only one of the regular political visitors at York House who, even in spite of a natural prejudice against science, gradually found themselves inoculated with a scientific appreciativeness. These lines have been written since John Morley's *Life of Gladstone* appeared. There has been much inaccurate conjecture as to how and where the statesman met his future biographer. It will be of some permanent politico-literary interest if the present writer places it on record that this meeting took place on May 18, 1879, in the drawing-room of Sir M. E. Grant Duff's Thames-side residence, York House, Twickenham.

ON HAMPSTEAD HEATH.

On sunny days, when skies are blue,
Warm light above, green-sward beneath,
What place so good to wander through
As Hampstead Heath?

The wild west winds all boisterous sweet,
The biting breezes of the north,
Here on the moorland rush to meet,
And eddy forth.

And here's a blue flower like a bell,
The earliest grown for summer's wreath;
And here's a primrose in a dell
On Hampstead Heath.

Then, when the moonlight floods the skies,
And Nature's breath is still and deep,
When, far below, great London lies
In restless sleep,—

The spectral horsemen ride amain,
With useless sword in ghostly sheath;
And all the past grows real again
On Hampstead Heath.

And shades of lovers long since dead
Flit o'er the undulating ground;
Immortal words that once were said
Still linger round.

And all the night and all the day
Is wonderful with life and death,
While men may think, and children play
On Hampstead Heath.

FROM THE BACK OF BEYOND.

By LADY NAPIER of Magdala.

THE potatoes were rattling in the tin cans, goodly pyramidal piles of them, covered with rich brown earth against frost, showing that there was a plenteous harvest of that precious tuber.

The crofters paused in their labour of lifting them, shading their eyes from the long, level rays of the sun to gaze at the last tourist (or 'swift') steamer of the season bearing its load of Southrons to the nearest railway station 'away south,' with their mountains of luggage, their deal boxes with haunches of venison, their hordes of idle, greedy, overfed servants. The country was quit of them—quit of their 'patronising way,' as the crofters called it, their grumblings, their innovations, their many inventions—quit of them all for many months to come.

The roads still echoed with the sound of their horses' hoofs as they trotted away, with the shrieks of their motors, one and all flying south, as though the Evil One were at their heels, the land plague-stricken.

Such is fashion! The weather was lovely, the colour a dream and a glory; but it was the 'time' for going south.

Now the needy laird might return to the home of his fathers, which bitter necessity forced him to let for each shooting season. Now he might come back and shelter in the storm-beaten old house through the long northern winter and spring, pondering sadly as to whether he might dare to count on sojourning in the lands called by his name until the day came when he should be carried out whither he would not, feet foremost. Shooting-rents were going up; but who could count on them for what changes might be in store, what fads might be started by some new Government, inebriated with the exuberance of its own generosity in dealing with and distributing the goods of others—drunk with power, mad with furious desire to reverse the order of things as they are, no matter who went, so long as they stayed (in place and power)? 'Well, well,' said the laird to himself, 'anyway, to-day it is ours; the herring have been plentiful, and there is no potato disease, and this dirty thing is to the good;' and he thrust his shooting tenant's cheque into an envelope, addressing it to his long-suffering bankers.

So peace settled down on the winged isle once more.

A crofter woman stood on the shore, watching her little lad stumbling over the slippery rocks on his way home from fishing, a string of 'cuddies' and rock-cod in his hand, his crooked fishing-rod over his shoulder. Her six-year-old daughter clung to her skirts.

The sun had sunk behind a heavy bank of cloud, and a moan came up from the sea. The tide had turned, and the wind was rising.

The woman sighed, and gazed seawards with fear-filled eyes, for her husband was away at a late fishing, and his boat was old and crank.

The three walked slowly up to the little black house on the hill, one of the poorest-looking in the township, but warm and snug inside, and water-tight withal, with its fine close thatch.

The children in bed, the woman crouched over the peat-fire, her thin hands locked together, her knitting unheeded on the floor, where a little cat played with the ball of yarn.

The wind roared round the house. It had risen to a gale.

At length her head fell forward on her breast, the tired body crying out for sleep and rest. She awoke with a start and sought her bed, but sleep forsook her weary eyes.

The gale was at its height.

Little Mairi moaned in her sleep, and her mother rose and took the child into her own bed, finding comfort in the contact of the soft, small body, and in listening to the regular breathing of childhood's heavy sleep.

Wide-eyed she listened to the howling of the tempest. The peats fell together; and, as a bright flame sprang up, the door suddenly opened, and

[*All Rights Reserved.*]

her husband, clad in dripping oilskins, came into the room and walked up to the fireplace.

Something tied the wife's tongue, and also prevented her rising to greet him. He raised his arm and groped in the chimney for a moment, peering up it; then she heard him sigh, and he turned and looked at her, and she knew that he was dead, for as she looked he vanished. With earliest daylight the distracted wife betook herself to the house of her sister, and told her what she had seen.

The women never doubted, and wept together through that day, and alas! and alas! the vision had warned but too truly, and the dread message came in due course, telling the poor wife of the loss of her husband's boat and the drowning of its crew. The heavy days crept on, and winter asserted itself.

The poor must work though their hearts be broken; and little Mairi was often left at home alone to watch the iron pot while her mother carried creels of peats and potatoes on her thin shoulders, the cold rain beating on her bare head, the wind piercing through the ragged skirt she had herself dyed black in respect for poor Donald's memory.

'Mother,' said the child one evening, in the familiar Gaelic, 'there is a stone loose in the chimney. All day I was afraid it would fall into the pot.'

'Where is it, *ghaol* [love]?' said her mother. She looked, and there was indeed a loose stone that she removed with her hand, and behind the stone a hole had been scooped out, and in the hole was a canvas bag containing twenty pounds in gold and one-pound notes.

Poor drowned Donald's savings!

The widow burst into tears.

'Would to God that he had got a better boat for himself!' she sobbed. 'But he never thought of himself, not he; and now he has gone, and we are alone.'

GIANT CIRCUMSTANCE.

CHAPTER XVIII.—THE CRY OF THE KELPIE.

CARRICK found himself very comfortably lodged in a corner of his big house.

Old Donald, by a stroke of unlooked-for inspiration, had fitted up one of the turret rooms as a sitting-room for him, and his bedroom was just below it. It was not too large to warm comfortably with a peat-fire, the views all round were magnificent, and he had longed all his life to live in a round room.

'Excellent!' was his satisfied comment when the old man began to explain; 'you couldn't have done better for me.'

'Ah, well! I thocht mebbe ye would like to look aboot ye. A man iss lost in thae big rooms below, an' it will pe a savin' in peats forby.'

Geoff had two or three more things brought up from the lower rooms, hung half-a-dozen cheerful pictures on the walls—not portraits, needless to say, since he hardly felt on terms with them yet—and found himself very much at home.

He was tempted to ask the old man about his fair Lady Disdain again, but discovered within himself an odd disinclination to expose his interest in her. She had doubtless departed long since, and inquiry would only excite surprise.

He did, however, inquire about the disused mine, but got little in reply.

'Ay,' said the old man, with a melancholy wagging of the head, 'they pit a sicht money into yon hole, but naething ever cam' oot it.'

'And where does the road through the glen at the foot of the loch lead to? I was astonished at the amount of traffic there appears to be in that direction, judging by the number of footmarks in the snow.'

'Oo ay! That iss to Innisrath, just a wheen wee hooses the ither side the island, fishers mostly, and they wass aye comin' an' goin'.'

Mrs Cameron's provisioning was, like herself, of the plain and wholesome type. Her porridge was beyond praise, her fish and puddings praiseworthy, her mutton, when available, past praying for, probably because her opportunities in that direction had been limited.

However, Geoff was no gourmand, and he had eaten with relish poorer dishes even than Mrs Cameron's mutton. And then that wonderful wide outlook over sea and land, and the restful quiet of it all, made up for every shortcoming.

On Tom Brading, whose only variation from the ceaseless hum of London had been the turmoil of barracks and camp, the remoteness and solitariness weighed somewhat. He moved about noiselessly and spoke with bated breath.

'What's the matter, Tom, my lad? Not feeling ill, are you?' asked Geoff anxiously.

'Not to say ill, Mr Geoff; but it's fearsome quiet. Feels like bein' in church an' no talkin' allowed.'

Geoff laughed. 'It is a bit of a change from London, isn't it?'

'You're right, sir,' said Tom fervently.

'But there's no need to feel that way. You may laugh and whistle and dance if you want to.' At which Tom shook his head, as who would say, 'Not me, sir! I know better.'

'They are making you comfortable down below there, I hope?'

'That's all right, sir. Sight better than St

George's or even the Soudan. There's an old lady down there that's an invalid'——

'Oh!'

'Not that I've seen her myself, sir. Keeps to her bed as far as I can make out.'

'Some relation of the Camerons, I suppose.'

'Shouldn't wonder, sir. They ain't much of talkers at best, the old people, an' as often as not it's Dutch they're talkin' to one another.'

'Oh, well, just enjoy yourself as much as you can, Tom. You'll relish London all the more when you get back there.'

Carrick himself felt that, after all his strenuous work in the stony silences of Farnborough, a few days of absolute loafing in this wide, untrammelled atmosphere would be regeneration. Here he could shake hands once more with freedom and feel himself his own man again. He had brought with him half-a-dozen of the best novels of the year, a sufficiency of tobacco, and an expectant pair of virgin skates bought four years ago and never yet wedded to ice; and with these trusty aids he had no fear of the days seeming long.

After dinner, that first night, he cleared a course round his room and tramped it in vast and insatiate enjoyment.

His aerie topped the roof of the house and afforded him such a view of sea and hill and sky as ministered to his soul. Seaward, all was darkness and mystery, out of which came only the sound of waters, the slow rhythmic surge of the Atlantic on the shores of the loch and on the rock on which his house was built. The blue-black vault above seemed but a remote, impalpable void, in which the greater and the lesser lights swung close and bright. Over the eastern hills a waning moon floated like a golden boat with little light but just a touch of glamour.

He stayed his round each time to look at the hills and the moon; and as he stood so, wondering how the loch and the glen and the serried pines must look under that faerie glimmer, the short, joyous bark of a dog on the terrace below, and a sharp, subdued reprimand, carried his thoughts like a flash to that other dog who had been sharply called to heel one day for just such gladsome greeting of a stranger.

He listened intently. He could almost have sworn to that bark. And then he smiled to himself at the thought, and at the absurdity of the wish which was father to it.

Yes, he would like to meet her again—he would dearly like to meet her again. He had seen so much of her, mentally, in these last few months that he seemed to know her quite well. He would like to compare his mental photograph with the original. He would like to ask her plainly why she looked at him so. And—behind and above all that—there lurked within him a vague desire, barely formulated and as yet quite unconfessed, to draw the venom from her look and charge it with something more to his liking.

He heard quick, light steps go off towards the little stone pier; but, for all his listening, nothing more, and the pier he could not see even if the moon had been brighter.

And so to further tramping, and much tobacco, and frivolling among books, every page of which, with subtle provocation, was curiously water-marked with a pair of dark eyes full of scorn and detestation, and much more besides.

And again a strange thing happened as—unable to fix his attention on printed words, because of those dark eyes that would stare up at him through them—he stood one time looking at the floating moon and the mystic glimmer and glamour of the hills.

From somewhere among those shadowy hollows there came a strange, mournful cry, a long-drawn minor note, with a trembling cadence like a long, low moan or a prolonged sob of mortal agony. It was not very loud, yet it had reached him clearly through the glass. He threw open the window and stood listening intently until the continued silence grew irksome. Uncanny as the sound was, he craved it again, so that, if possible, he might diagnose it.

He began to doubt if his ears had not deceived him. It was some trick of the wind in the casement. It was some unhappy dog on the shore. It was—— But it would not do. He knew perfectly well that it was none of these things, though what it was he could not tell.

He was just about to close the window when his outstretched hand stiffened in the act, as the long, trembling wail pealed out once more from the glimmering mountain fastnesses and came swelling along the thin, clear air.

He could make nothing of it. Whatever made it, it was a most awesome and discomforting sound. He had certainly never heard anything like it in his life before. He had heard many a queer sound in his life, but nothing quite so weird and disturbing as this.

The surroundings were no doubt largely responsible for the sense of discomfort which laid hold on him. Abnormal sound is at all times repugnant, and indeed holds the seeds of panic until its cause is discovered.

The solitude in which he had rejoiced became suddenly peopled with gruesome possibilities. The frosted trees and bushes below stood stark and still. There was not a sound beyond the cold *lip-lap* of the tide on the rocks. The hills glimmered ghostly in the wan light of the moon. And across the peacefulness of it all that baleful cry rasped like a saw across a quivering nerve.

While he waited for it to come still again, he heard the door at the foot of the tower open softly, and, leaning quietly over, he saw Tom Brading standing on the top step looking out towards the hills.

And presently the wailing cry broke out again along the night air, and the figure below proved its identity by a fervently scared 'Good Lord!'

'Well, Tom, what do you make of that?' Geoff asked softly.

'In God's name, what is it, Mr Geoff? It makes one's neck creep.'

'What does Mr Cameron say about it?'

'He 's across in the boat, Mr Geoff.'

'It 's some big night-bird surely,' suggested Carrick.

''T 'd need be a big one, sir, to make that noise.'

'Well, don't you worry about it. I'll tackle old Donald in the morning and get to the bottom of it. Now, I 'm going to turn in. Good-night!' and he heard the door below close quickly, as though Tom Brading preferred not to be last man out when things unexplainable were to the fore.

They heard nothing more that night, and in the morning Geoff was out betimes on the terrace, rejoicing in the white splendour of the clear December day. In that crisp, tonic air, with all the hills sparkling in the sunshine that had no heat but only enchantment in it, and the very wavelets laughing and dancing merrily, it was not easy to understand the discordance of the previous night.

He saw the boat put off from the shore, and presently old Donald came up the terrace steps with a string of fish for breakfast.

'Grand morning, Mr Cameron!'

'Fine mornin', sir!'

'What was that curious noise we heard last night in the hills? Did you hear it?'

'Ay!' and the old white head wagged lugubriously.

'What was it? I never heard anything quite like it before.'

'I wouldna like to say myself. Ye s'uld ask Tuncan Cameron. He iss the man that unterstans these things.'

'And where is Duncan Cameron?'

'He iss the schoolmaster there,' with a backward jerk of the head. 'He iss a ferry cleffer man iss Tuncan Cameron.'

'All right! I'll go over after breakfast and have a chat with him.'

And so, in due course, Geoff and Tom Brading stood on the step of the schoolmaster's cottage and thumped on his door.

'Mr Duncan Cameron?' asked Geoff, as the door opened and a grizzly-headed and bearded man of sixty or so stared at them and round them for a minute, and then invited them to enter with a 'Come away in, sirs! Come away in! The place is no' redd up yet, but ye 'll just excuse it. Ah 'm no' a merriet man, ye see, and am dependent for some things on outside assistance. Ye 'll be Mr Carrick, I 'm thinking. And what can I do for ye, Mr Carrick?'

Mr Duncan Cameron's interior was much on a par with his personal exterior, and stood, as he had hinted, in sore need of redding up. His face, and his supper and breakfast dishes, would have been all the better for a wash, his hair and easy costume and his furniture for a little putting to rights. Moreover, at best he was not prepossessing. He was afflicted with a terrible squint, which at once fascinated and disconcerted the object of his attention, and his eyes and red nose seemed to point to anything but teetotal principles. Geoff felt distinctly sorry for the youngsters entrusted to his care.

'I am told you know more about things in general than most people, Mr Cameron,' began Geoff diplomatically.

'Aweel, I had the advantage of a unevairsity education at Glesca College, ye see, sir; and that iss what no other man hereabouts can boast of.'

'And you know all that is to be known about Innismohr, I presume?'

'Aweel, as much as most, no doubt.'

'I came to ask you specially this morning about that queer noise I heard in the hills last night. Did you hear it?'

'Ay, I heard it;' and the grizzly head nodded portentously, and the strange, twisted eyes settled on a far corner of the room, though Geoff felt uncomfortably certain that their owner was looking keenly at himself.

'And what causes it?'

'Well'—— said Mr Duncan Cameron, reaching up to the mantelpiece for a black clay-pipe, and looking vaguely round for tobacco.

'Try one of these, by way of a change,' said Geoff, and handed him his cigar-case.

'I thank you, sir. They do say it iss the kelpie that lives in the loch. You haf seen the black loch among the hills?'

'Yes; I came round it. What 's a kelpie?'

'Now, that iss no' easy to say, sir, for no one has ever seen one, so far as I know. Some say it iss like a horse, and some say it iss like a cow. But those are just tales. They do say that any man who sees it would never live to tell what it iss like.'

'And what 's your own opinion, as an educated man, Mr Cameron? Do you give credence to such old wife's talk?'

'I 'm no' saying that I do, and I 'm no' saying that I don't—I 'm Highland-born, ye see. And although, mebbe, Glesca Unevairsity wouldna endoarse all they tell aboot the kelpie, I 'm no' caring to prove things either way in ma own proaper pairson.'

'And does the kelpie, whatever it is, often make a nuisance of itself like that?'

'I have heard it three times before in ma life,' said Mr Cameron slowly, emphasising his remarks with sombre baton-strokes of his cigar; 'and each time there wass sorrow came after it;' and his manner was so charged with mystery and foreboding that Tom Brading fervently wished himself back in matter-of-fact, bustling London.

'How then?' asked Geoff.

'Well, sir, I will tell you. And this, mind you, iss what I know of my own knoawledge, not by hearsay. The first time I heard the kelpie cry wass when I wass a boy, and it frichtened me near oot

ma wits. I mind asking ma mither what it meant, and she just said, "You wait, my man, and you will see." And inside a month they found the old laird dead in his room in the castle—one of the round rooms in the tower.'

And Tom Brading shot a swift, scared glance at his master, as much as to say that if he were in the habit of occupying one of these rooms he would change his quarters without delay.

'And the next time I heard it was when the young laird was killed; and the last time was when the laird himself died.'

'So it 's a kind of family ghost?'

But Mr Duncan Cameron shook his head doubtfully at that.

'Once it cried while I was away at the unevairsity, and there was a man died then; but it was not one of the family.'

'Who was it?'

'The laird had let the castle and the shootings to an American, and it wass his son that died. He was drowned in the black loch the day after the kelpie cried.'

'I would rather like to experiment on it with a bullet,' said Geoff. 'Do you suppose it is armour-plated?'

'I know nothing about it, sir,' said the schoolmaster solemnly; 'but I wouldna like to try myself. I'm no' what ye might call a supersteetious man; but there iss some things one does not care to meddle with. There 's mair things, ye ken, in heaven and airth'——

'Yes, I know,' said Geoff; 'but I've an idea that a rifle-bullet is a much more concrete fact than a kelpie. I would rather like to see the result of a meeting between the two.'

At which Mr Duncan Cameron only shook his head expressively, and Tom Brading devoutly prayed that he might not be of that hunting-party, if ever it came off.

'One more question, Mr Cameron. Where do all the people here get their black hair and eyes from?'

'From 1588,' said the schoolmaster, with a quick, odd glance at him.

'I imagined so. The strain shows very distinctly. One of the Spaniards came ashore here, I suppose.'

'So they say; but there iss no trace of it now—except in the people.'

'And that lasts longer than wood or iron. Well, we 'll get along. I am obliged to you, Mr Cameron. If you come across our friend the kelpie, give it a quiet word of advice not to disturb people with its wailing, or I shall certainly try the effect of a rifle-bullet on it. A stuffed kelpie would be quite an addition to the British Museum.' And he strode away through the white sparkle of the sun, with Brading close behind him, and nodded pleasantly to the black-eyed youngsters who peeped shyly round open doors, and to the oval-faced, dark-haired women who stood in the shadows behind them. And Mr Duncan Cameron stood at the door of his cottage and looked thoughtfully after them.

Geoff was making for the glen that led to the loch among the hills when his eye caught a slightly trampled path striking up to the left; and as it promised new pastures he turned into it at once.

Mr Duncan Cameron whistled softly to himself and went indoors.

'And how does Mr Duncan Cameron strike you, Tom?' asked Geoff cheerily.

'He don't look you what you might call very straight in the eye, sir.'

'He don't, Tom. That 's a fact. And whether the defect is entirely physical I 'm not quite sure in my own mind. However, we 'll walk him off. You got the candles?'

'I got 'em here, sir. You don't lay any store by that kelpie thing, Mr Geoff?'

'I don't, Tom. And that 's another fact. Mr Duncan Cameron does not impress me as a man to place implicit reliance on. Now, I wonder where this path leads to. Somebody uses it, that is evident. Perhaps if we go far enough we 'll find out who it is.'

(To be continued.)

THE HOME OF THE PIGMIES.

By Rev. REGINALD A. GATTY, LL.B.

THE object of this article is to stimulate research, and to show how the veriest amateur may in his small way contribute to the sum of scientific knowledge. An old earthwork was the first object which started my zest after archæological investigations, and I very soon acquired the one requisite in all such work: a quick and observant eye. It is surprising how blind many people are, and how little they see what is before their very eyes. I remember asking a friend who had recently returned from a tour round the world what had struck him most when he was in Japan as regards the scenery of the country, and especially the trees and flowers; but none of these had attracted his attention, and all he could remember was that the hotel at Tokio was not equal in its cookery to the accommodation he got at San Francisco. These people hardly deserve the privilege of such an opportunity of improvement as a tour round the world.

The faculty of observation is not sufficiently developed in our educational system; and I believe that when I taught the children of our village school how to pick up flint arrow-heads and scrapers in the ploughed fields they got more good than from plodding hours over fractions. I had previously

taught myself; for, when the land was ploughed round the earthwork I have mentioned, I set to work to find some traces of the former people who had raised this mound of soil. The answer quickly came in a nice series of flint implements, such as knives, arrow-heads, scrapers, and other neolithic tools.

It may be well, perhaps, to make a few remarks about what is called the stone age, as every one has not taken the trouble to read the scientific books upon the subject. Whether man was resident in Britain prior to the glacial epoch is a matter of some doubt, and it would be of little use to repeat here the various opinions upon this open question. What we do know for certain is that in a very remote period a terribly cold time supervened, changing a temperate climate to one of arctic severity, and covering all North Britain with an ice-sheet extending almost to the Thames valley. In the north of Scotland the ice was as much as three thousand feet in thickness. It gradually moderated in thickness as it extended south; but the greater part of England at that time was practically within the arctic regions. This fully explains why up in the north of England palæolithic implements are never found. No life was possible so long as this ice-sheet covered the land, and neither man nor beast could possibly have lived under such severe conditions.

In the south of England, however, appear the earliest traces of man in the river-drift. Here in the gravels of former river-beds are seen the first rude implements of his handiwork, and these are remarkable for their great size. It certainly must have required a hand of no mean grip to grasp the heavy tools of flint six to eight inches long, which, when compared with the small neolithic tools, have the appearance of belonging to a race of giants.

We have, however, to remember that man at that period had to contend with animals of great size and power. The mammoth would be no mean antagonist to face in the forest, and the grizzly bear, hyena, and cave-lion would require some formidable attacks to drive them from the caves which man might wish to shelter in. But there is certainly a remarkable difference between a large palæolithic implement weighing a pound or two in weight and several inches in length, and one of the minute tools I am writing about, sixty of which when put into the scale weigh under half an ounce.

Considering that all palæolithic implements are found in river-drifts or cave-deposits, they rarely come under the observation of the amateur collector. His work must principally be confined to searching ploughed fields and barren places where the flint implements of the neolithic period occur in plenty. The neolithic or new stone age followed the palæolithic or old stone age; but between the two is an interval which as yet has not been clearly defined, and it is impossible to show the connection between the two eras.

A new race apparently had taken the place of the makers of the big rude tools, and the forms and working of the neolithic tools show a marked improvement in every way. The old fauna and flora had disappeared, and animal life and vegetable life were pretty much the same as we see them now. Neolithic man domesticated animals, grew cereals, and lived in settlements on the land, moving, no doubt, from place to place as the pasturage became exhausted. This nomadic existence perhaps accounts for the distribution of flint implements, which is very remarkable. A search in almost any part of England over land which has been ploughed and well washed by rain will be rewarded by a find of flint implements. You need not live in a flint district to prove this. In fact, a flint is much easier to detect when no other stones of similar character are near it, and you may be sure each piece, even if not a true implement, has been imported.

For instance, in my own experience on the moors of South Yorkshire, high up on the Pennine Range of hills, I found splendid examples of neolithic flint tools, but the nearest flint-beds were the Yorkshire wolds, sixty miles away at least. It is difficult to imagine what the inducement could have been in this bleak and desolate region to tempt neolithic man to leave the richer valleys below and face the cold and exposure on the moors. Clad in skins, and with only a rude hut to shelter him, and little game to hunt for food, he could have had but a cheerless existence. He may have been forced to take refuge here by an invasion of a stronger tribe driving him out from his home on the lower grounds, or it is possible that a better climate existed on the moors in those times than we have now. There certainly are indications of a forest having existed on these moors, and sometimes when digging has been going on among the peat the horns of *Bos longifrons* have been discovered.

It was here, at an altitude of a thousand feet above sea-level, that I found the first minute flints which I called pigmy on account of their size. This was more than twenty-five years ago; but I could not get the authorities on flint implements to allow that they were genuine tools.

A more interesting discovery than mine was made by Dr Colley Marsh of Rochdale, who, on the same Pennine Range, at an altitude of thirteen hundred feet, dug ten feet down into a peat-bed, at the bottom of which he found quantities of these pigmy flints associated with ordinary neolithic tools. Here was abundant proof that the makers of these small flints had once lived upon these moors of the Pennine Range, and from finding ordinary flints with them it would be a fair surmise to say the makers of these were also makers of the pigmy flints. Against this, however, is the fact that in only very few places in England have these minute tools been discovered.

In Belgium, M. Pierpont found pigmy flints with no other flints near them. In India, up in the cave shelters of the Vindhya Hills, Mr Carlyle found the floors thickly strewn with these same tiny implements, and he brought some thousands back with him to England. In the account he gave of his

discovery he states that no large tools were associated with them.

The presence of various types in one locality is no sure proof that they were contemporary; and so far I think the evidences are in favour of crediting the pigmy-flint makers with being a distinct race. At any rate, my own experience supports this idea, and the discoveries I made in North Lincolnshire are so extraordinary that I think there is little doubt about the matter. I know this is not the opinion of the highest authorities.

The British Museum has brought out a new *Guide to the Stone Age*, a most valuable book, and beautifully illustrated. This authority says, speaking of the Rochdale pigmy flints: 'These minute and finely chipped specimens of characteristic crescent, triangular, and rhomboidal forms are often called "pygmy flints," and are found in India, Palestine, Egypt, North Africa, Southern Spain, France, Belgium, and in several sites in Great Britain, notably in Eastern Lancashire, Scunthorpe in Lincolnshire, Sevenoaks, and Hastings. The curious persistence of the same forms in all these countries has led to the conjecture that they are the work of one and the same race; but the same argument might be used to prove that the barbed stone arrow-heads of Europe, Japan, and North America were the productions of a single people. However, it may be explained, the similarity of form is sufficiently striking to deserve careful attention. Various conjectures have been made as to the use of these implements, which are manufactùred from small flakes, the natural edges being in most cases left untouched, and the thicker sides or backs carefully finished by secondary chipping. Some have supposed that they were tied to the points of arrows, others that they formed lateral barbs of harpoons, others that they were tattooing instruments, others that they were fish-snags, others again that they were used for making holes in skins or even harder substances like shell. The last suggestion seems to be borne out in the case of the small points found in South Spain, as diminutive shell-discs were found in association with them, but we need not assume that their use was in every case uniform, for very few show any signs of wear. The pygmy implements are usually assigned to the neolithic and early bronze periods.'

Now, the use of the arrow-head, which is universal and absolutely necessary for the support of human life, is hardly a fair implement to bring into the argument when you are dealing with tools so difficult to assign uses for as pigmy flints. It is quite allowable to say the necessities of man developed the arrow-head in all parts of the world. It is simply a point for piercing, to which in some cases, but not in all, is added a barb on the two sides to prevent it from falling out.

On the other hand, there are at least four varieties of these pigmy tools, perfectly distinct in form and make, to which no reasonable use can be assigned. To give Mr Carlyle's designations, they are (1) the shouldered pigmy flint, (2) the rounded and pointed, (3) the crescent, (4) the rhomboidal form.

It is utterly impossible to trace the slightest difference between those forms found in India and those in England, and this fact has led the Rev. Canon Greenwell to write the following opinion: 'I can say without the least hesitation that the pigmy flints are manufactured articles, and brought into certain shapes to adapt them to certain purposes. I can also confidently assert that many show evident and abundant signs of having been in use. The next matter about which I can speak with perfect confidence is the fact that flint or some other stone implements, fabricated after the same fashion and characterised by the same forms, have been found not only in several localities in England, but also in Belgium and other places in Europe, and in very great abundance in India. In fact, so similar are many of the pigmies found in India to those found at Scunthorpe, Lakenheath, &c., that but for the differences of material, any one on seeing them would say without hesitation that the Indian specimens had been picked up at Scunthorpe. Nor do I think it possible—though I do not now speak so confidently as I have already spoken about their being manufactured—that they could have originated among different peoples who had no intercourse or traffic going on between them. A common intelligence, a common purpose, a common material could not, I think, produce forms so marked, and indeed peculiar, as are found among these tools. What the relationship, intercourse, or traffic I have suggested may have been I know not, but that there was a connecting link I believe.'

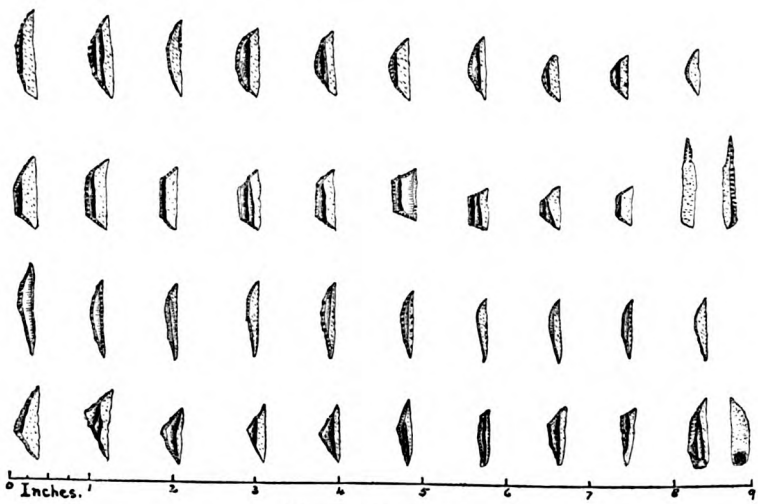
I have, however, further if not stronger evidence than the words of the learned antiquary I have just quoted. It was my good fortune to drop on what I may call the home of the pigmies. Scunthorpe in Lincolnshire not many years since was a small agricultural village, and the land about it had little value, for it was mostly sand, and there were great commons on which practically nothing grew, for the never-resting wind blew the sand to and fro, and the bracken fern and some heather seemed the only plants able to contend with it. Then a discovery was made that beneath the sand, the depth of which in some places was twenty feet, a valuable bed of ironstone existed, and the little village rapidly became the centre of a thriving iron-smelting industry. The process of obtaining the ironstone is simple enough. The sand is dug away and the ore bared, and then a fresh surface of land is laid out, which grows better crops than it did before.

A curious feature about the sand is that it is all æolian, the result of great sandstorms in the past, and not a marine or lacustrine deposit. On the high parts of the common the wind is perpetually altering the contour of the ground, raising and levelling mounds, according to the direction in which

it blows. It will be readily understood that such a place, with its changing surface, would be very suitable for the discovery of flint implements if they were there, and I soon had the satisfaction of finding that it had been the site of human habitation in neolithic times. In various directions I found patches of charcoal and signs of hearths, and here and there flakes of flint lying about just as they had been struck off from the flint cores. In more than one place was a heap of cremated bones, and the wind one day exposed what is called an incense-cup. This is a small hearth-baked pottery vessel, about three inches high, with holes in the side.

Canon Greenwell, in his work *British Barrows*,

SCUNTHORPE, LINCOLNSHIRE.



VINDHYA HILLS, INDIA.

describes these vessels, and as to their use, suggests that they contained the lighted charcoal which was carried in the ceremonial accompanying cremation. He gives a note describing the funeral of an Indian, Narayan Wasudeo, a member of the Legislative Council of Bombay: 'The sacred fire, which had been kindled with due ceremonies at the house, was carried in front in a brazen vessel by the deceased's son. While this (the making of the funeral pyre) was being done, a number of torches of sandal-wood were being carefully ignited by the son of the deceased at the sacred fire which he had brought with him for the purpose. The friends, when the torches were lighted, set fire to the combustibles.' The extract is taken from the *Times of India*, September 1, 1874.

This touch with India is suggestive, but I must own I was perfectly astonished when I found pigmy flints

identical with Mr Carlyle's Vindhya Hill specimens strewn about in all directions. It is true I came across every now and then an ordinary neolithic flint implement; but the pigmies so largely predominated that they hardly counted. This proved that these Anglo-Indian tools had been made on the spot, for in one place, among a lot of flakes of a peculiarly coloured flint, I found a pigmy of the same material. But if the Vindhya Hill specimens were small, the Scunthorpe pigmies were much smaller. When compared with the Indian tools, the respective sizes are as follows: the smallest Indian shouldered form is ten-sixteenths of an inch; smallest Scunthorpe, three-sixteenths of an inch; smallest Indian rounded and pointed, ten-sixteenths of an inch; smallest Scunthorpe, four-sixteenths of an inch; smallest Indian crescent, eight-sixteenths of an inch; smallest Scunthorpe, six-sixteenths of an inch.

With regard to the respective quantities found of pigmies and ordinary neolithic tools, I think it would be fair to say that while collecting two thousand Anglo-Indian pigmies I have got fifty neoliths. It is impossible in an article of this character to describe the exquisite work upon these minute flints. They are covered with delicate flaking, but how this was produced it is impossible to say. When you take up such a mite as one measuring three-sixteenths of an inch it disappears between finger and thumb. How was this held so as to enable the workman to take flakes off it? Flint is a very hard substance; and though you can by pressure remove flakes from it, you have to exert very considerable force. In the case of the Indian pigmies this must have been more difficult, for all of them are made of chalcedony or agate, which are still harder substances to work. Among the Scunthorpe pigmies I found a few chalcedony specimens.

It must not be supposed that every visit paid to the home of the pigmies results in a rich capture of spoil. The wind plays the principal part, covering or uncovering as it pleases. In a high wind you can see nothing. The sand whirls around and above you, fills your eyes, and I have been compelled to lie flat down and cover my head like a camel in a sandstorm.

I often ask myself, what is the meaning of this discovery, and what does it suggest? Before I addressed the Anthropological Society in London I was warned to state facts, and not to speculate. This may be very wise counsel, but it leads nowhere. The *Guide to the Stone Age*, recently published by the British Museum, offers no solution of the problem; but I think it would be unfair to my readers if I closed this paper without expressing my own views. From the top of the common, where the flints are found, you can see a few miles away the broad stream of the Humber, where the Trent joins it. If a migration from India took place in neolithic times, one could imagine the rude vessel of those days being rowed up with the tide, and disembarking its strange occupants near to where they could take up a position on the high ground. It is true the sandy and almost waterless common would offer poor accommodation and means of support; but we need not suppose they remained there for any great length of time. I have shown that they moved on, at any rate, as far as the Pennine Range, and no doubt traces of them would be met with in other directions if people nowadays only used their eyes more. It requires, I know, sharp sight to detect a pigmy flint even when you have merely a sandy floor to deal with. It is doubly difficult on ploughed land.

The next question is, what kind of people were these makers of pigmy flints? Were they a small race, the progenitors of the myths of dwarfs and fairies which delighted us in our childhood's days? Perhaps it would be unwise to follow this line of speculation any further. If I did I should certainly meet with very severe treatment at the hands of the scientific authorities. I have the satisfaction of knowing that what is a mystery to me is equally a mystery to them, and I live in hope that some day the blowing sand will uncover the secret of the home of the pigmies.

AN EXPERIMENT IN NEUROLOGY.

CHAPTER IV.

CLIFF HARBOUR had enjoyed a picnic, to which many people came from adjoining settlements, and in the evening dancing was still in progress in the rough pavilion provided for that special purpose. To Winfield the country sports were rather jarring on the nerves than otherwise, and he had neither the temperament nor the inclination to be amused at the awkward swains and bashful maids who had come in for a day's pleasure. But he was easily the most graceful dancer in the company, and that was a consolation, especially since Mollie Craig was present, tall, graceful, radiant in bright apparel, and as unaffectedly happy as it is given to healthy youth to be. It might almost be said that she exhaled an atmosphere of health and good cheer, and to Winfield, who by this time was possessed of an uncontrollable desire to win her favour, regardless of any other consideration, present or future, proximity to her was like a draught of wine. It chafed him that Morton should have been the man to seek him out and insist that he should join their set, and that Morton's sister, a shy and quiet maiden, should regard him with manifest approval. She danced well, but his thoughts were not of her. They were

all kind to him; but his eyes followed Mollie Craig, and when they danced together a calm fell upon his nerves, and he was content.

'I am afraid,' he said to her once, as they strolled in the moonlight outside the pavilion, 'that I shall grow too fond of Cliff Harbour, and want to stay here.'

'Why not?' laughed Mollie. 'But you would be tired of us in the winter.'

'That would depend,' said Winfield suggestively.

'On the weather?' queried she.

'On you,' he answered, suddenly facing her and speaking in hurried tones of passion. 'You are so different from the people I have known. I can't tell you what I feel. But it seems to me I have only known'——

'Stop—please!' cried the girl. 'Oh! I'm so sorry. You don't know. Mr Winfield, you mustn't speak like that. I never thought—— Oh!'

She had caught his arm and looked into his face with an expression of grief so sincere that it could not be mistaken.

'Pardon me,' he said. 'I—I should not have spoken. Forget it, and let us be friends.'

'Friends always,' cried the girl. 'But—please—don't let us speak of it again.'

By mutual consent they went back to the pavilion, and Winfield saw her take the arm of Dave Morton to join another dance. He was urged to go with them, but pleaded fatigue and went out again, the prey of conflicting passions. Savagely chewing at a cigar, he walked about, paying no attention to his surroundings, seeking to quell the tumult of jealous rage that had swept over him. Suddenly he was accosted.

'Hello, mister! Got any more cigars?' The speaker was one of a group who had come in from the back settlement, and, by some mysterious process known only to communities where local option laws are enacted, had discovered liquor. They were now in the mood for war, and Winfield turned up at the psychological moment. He walked on without a word; but one of them followed him, caught him by the shoulder, and called out:

'Say, mister, don't put on airs round here. It won't go.'

Winfield shook himself free and started to move away, when the fellow seized him again. Winfield promptly knocked him down. In a twinkling the others were around them. The man who had been knocked down got on his feet and threw off his coat.

'Soak him, Bill?' yelled one of the crowd.

'I suppose I get fair-play,' said Winfield savagely.

'You'll git all that's comin' to you, mister,' retorted one of the crowd. Whereat several laughed.

The man who had removed his coat now rushed at Winfield, but the latter was not disturbed. The savage rage that had possessed him had found an outlet. He was not strong; but he knew how to defend himself, and his enemy went down again under a well-directed blow. By this time a crowd was collecting around them, and one of the friends of the fallen man made a vicious blow at Winfield. The latter was on his guard; but the fellow kicked him, and the man who was down leaped up and grappled with him. It was now one against two, and they threw him down.

'You cowards!' he gritted, struggling furiously to protect himself. The crowd was surging around them, the new-comers asking what it was all about, and several calling upon the combatants to get up and fight fairly.

Winfield was getting decidedly the worst of it, when two new-comers arrived on the scene. They were Dave Morton and Jack Allen, the latter a tall, raw-boned fellow, with an expression of perennial good nature on his rough features.

'Dig in, Dave,' he said; and they forced their way through the crowd to the spot where Winfield, panting and exhausted, was struggling on the ground with two men.

The crowd made way for the new-comers, for there was a tradition that once, down in the city of St John, Dave Morton and Jack Allen had stood back to back and put up the gamest fight against a group of 'toughs' the town had ever seen.

'What! three?' roared Allen. 'That's one too many. Get off there, you!'

He lifted one of Winfield's assailants bodily and threw him into the crowd. Morton leaned over the other two.

'It's Winfield,' he cried.

'You leave them alone!' shouted one of the original crowd that had accosted Winfield. 'This ain't your fight.'

Morton gave the fellow a quick glance, observed at the same time that Allen stood at his elbow, and without a word seized the big fellow who was locked in a fierce grip with Winfield, and by a tremendous effort brought the pair to their feet. In a moment he had broken the big fellow's hold and thrust Winfield's slight form between himself and Allen.

'Now,' he said quietly, 'if any of you fellows from Hay Settlement are lookin' for trouble, this is your chance.'

'That's what we're after!' yelled one of them; and the group, who had kept close together, made a rush at Morton, Allen, and Winfield.

'You'll get it,' smiled Allen, and sent the challenger down like a log.

They tell the story with great gusto in Cliff Harbour to-day how Morton and Allen, with the assistance of one or two others, went like a tornado at the men from Hay Settlement and fought them to a standstill, and how the little fellow from Boston, who ought to have gone into the prize-ring, got his second wind and planted blows with a precision and effect that was simply wonderful.

But Winfield was in bed for several days afterwards, and had to bear the condolences of Dave Morton, who would persist in calling every day and trying to do things for him. And Mollie Craig brought flowers from the cottage garden and gave him her warmest sympathy. The condition of his nerves, therefore, did not improve.

CHAPTER V.

JUST offshore from the lighthouse at Cliff Harbour is a reef, between which and the shore a vessel may pass in safety at high-tide. At low-tide (the rise and fall of Fundy's tides are twenty to over thirty feet) the jagged fangs of rock are visible. There, one night when a heavy sea was running, at nearly low-tide, the wind blowing a gale, a schooner tried to make the inside passage and went on the reef. She pounded heavily, and it was evident that her condition was perilous in the extreme. Five men were on board of her. The lightkeeper sent word in haste to the village, and men came to the shore. Among the first on the scene was Dave Morton, and he was one of the lifeboat crew who, at the imminent risk of their lives, brought four of the five men ashore in safety. The schooner went to pieces.

This was the story Mollie Craig told to Winfield as they sat on the shore near the spot on a glorious summer afternoon. He had never returned to the subject of their conversation on the night of the picnic; but his feeling toward her was more intense because of his brooding over the situation and his inability to understand why she should manifest so much sympathy and not give way to more tender regard. And as they sat together on the sunny green-sward in a sheltered nook, looking out upon the bay, his fierce emotions once more mastered him. Her praise of Morton was like the bitterness of gall to him. He could not, even to himself, assert that Morton was unworthy. But Morton was his rival, and was for ever coming between him and the fulfilment of his hopes. Not that he could complain of her treatment of himself. She had been deeply grieved by the occurrences of the evening of the dance, and blamed herself a little for having, though unwittingly, caused a part of Winfield's trouble. He had artfully led her to think that her sympathy was doing him a world of good, and continued his almost daily visits to Lighthouse Point. There was good fishing for cod offshore, and the lightkeeper had boats. Unobtrusively, therefore, Winfield could keep himself in evidence; and he was always welcome at the cottage.

On this particular afternoon it pleased him to appear a little despondent. She had assented to his proposition to stroll along the shore past the lighthouse, and when opposite the reef they sat down and she told him the story of the wreck. She told it well, the expression of her lovely features varying with emotions produced by recalling the terror and the heroism of that dreadful night. Hers was a dark, commanding beauty, for she was tall and strong and graceful, the embodiment of a healthy and fearless, yet warm and tender, womanhood. Winfield saw in her what he himself lacked, and as his eyes devoured her face and form, and he listened to the charm of her voice, and felt, perhaps unconsciously, the influence of the surroundings, all other feelings were swept aside by the one mad desire to set his will against hers and gain the mastery. Her hand was toying with a blossom on the green-sward. She was close to him, and silence had fallen for a moment between them. A tender light was in her eyes, for she was thinking of the man who reckoned his own life of little moment when others hung in the balance. Hurried into blind madness by his own passion, Winfield failed to understand. With a swift motion he caught her hand. Their eyes met, and for a moment her lids drooped under the swift electric message flashed by glance and contact. Then, without withdrawing her hand, she gazed again, quickly, inquiringly.

'Mollie,' he murmured hoarsely, 'do you know that I worship you? No—let me hold your hand—let me speak. I can't help it—I can't. There is no woman in the world like you. I have tried to keep my promise and be only your friend; but I love you so! Day and night it is always the same. I want you. You must care for me—you must.'

He drew nearer and tried to clasp her in his arms, but she was on her feet in a moment, the whole expression of her face changed. He too rose, his burning gaze still on her face.

'Mr Winfield,' she said very quietly, 'when I asked you never to speak like this to me again there was a reason for it. You should have understood. I wish I could have read your thoughts since then. You have not been fair to yourself or to me.'

'But why,' he burst out—'why can you not learn to care for me?'

'There is a reason.'

'Tell me what it is.'

'You have no right to ask that, Mr Winfield.'

'Surely I have the right of a man who loves you to know why you reject him.'

'No—I cannot tell you.'

'You care for another man.'

The girl was silent.

'The man is Morton,' he went on, with sudden rage. 'He has always come between us. Why should you'——

'Stop!' she cried. 'You have no right to speak to me in such a way. When you have thought about it you will be sorry.'

She turned to go, but, yielding to a sudden kindly impulse, wheeled about and faced him, an infinite compassion in her eyes.

'I can't understand, Mr Winfield, how a man who has seen so much of the world could care for a Cliff Harbour girl as you say you do for me. Go back to Boston. You will soon forget. Come, let us go home as we came.'

'No!' he cried, seizing her in his arms. 'You shall not go.' He was utterly beside himself. 'I swear to God if you leave me like this I will never go back alive.'

The girl had given a cry of alarm when he seized her, and now struggled to free herself. He held her frantically, pleading, muttering, almost hysterical in his excess of despairing passion. Neither heard approaching footsteps till a man stood beside them, and with an iron grip broke Winfield's hold upon the girl and sent him reeling to the ground. It was Morton.

'You cur!' he cried with bitter contempt, glancing for a moment at the fallen man and then turning quickly to the girl, who was trembling like a leaf.

'Has he hurt you, Mollie?'

'No, no! I'm only frightened. He must have been crazy. Oh Dave! I'm so glad you've come.'

She sat down limply, and they both looked at Winfield. He lay where he had fallen, motionless. With quick strides Morton reached him and attempted to raise him up. Blood was flowing from a cut in his head, and he was unconscious. In falling his head had struck a ledge of rock. Morton hurriedly placed a hand on his heart.

'He is hurt, Mollie,' he said quietly. 'His head is cut by a stone. I'll wrap it up. Get your father, and we'll carry him up to the house.'

'No, no! I'll help you myself,' said Mollie, completely mistress of herself again. She bound up the wound in Winfield's head, and together they bore him to the cottage, where their arrival caused the greatest consternation.

'He has had a bad fall,' said Morton, with a quick glance at Mollie. By the time they had laid him comfortably down he began to show signs of returning consciousness.

'See what you can do for the cut,' said Morton, 'and I'll get the doctor.'

His carriage was at the door, and at full speed he went to the village, returning at once with the village doctor. Winfield was by this time conscious, but suffering intensely. The doctor's examination revealed the fact that his skull had been somewhat injured, and that he could not be removed for the present.

'And I think,' added the doctor, 'you should notify his people. He will probaby be all right in a week or two; but his general condition is not as good as I would like it.'

CHAPTER VI.

'YOUR son has been injured. Not dangerous. Come down if possible.'

Nathan Winfield, senior, adjusted his glasses, read the telegram, made some hurried preparations, and said good-bye to the stock-market for the space of one week. Within thirty-six hours he was the guest of Craig the lightkeeper at Cliff Harbour, and gazing at a rather hollow-eyed young man whose nerves were giving the doctor no end of trouble, to say nothing of a rather ugly cut near the base of his skull.

'Father,' the young man said weakly, 'you've never let me want for anything; but you've never given me very much of yourself, and I haven't asked it. But I want you to stay right here till you can take me home with you.'

'Bless me!' ejaculated Winfield, senior. 'Why, of course I will. Don't worry, my boy—don't worry. You're a safer investment to-day than the best gilt-edge stock on the market.'

'But there's something I want to tell you,' the young man said. 'Close the door.'

The heart-to-heart talk that followed between father and son seemed to have a beneficial effect on both. The next day the patient was removed to the hotel; but before he left the cottage Mollie Craig was sent for. When she left his room her eyes were full of tears.

Before father and son departed for Boston two weeks later, the former took occasion to call Dave Morton aside and make the following observation:

'Young man, I understand you are soon to be married. I don't expect to be able to come down, though I'd like to; but I want you to send me a card in plenty of time—to this address.'

Which further explains why the costliest of the wedding-gifts received by Mollie Craig came to her duty-paid from Boston on the day before her marriage.

Nathan Winfield, junior, is his father's partner, and his old haunts know him no more. It is said that he displays remarkable nerve as an operator on the Stock Exchange, but is not fond of the society of women. When any charming lady of his acquaintance betrays the slightest partiality for his company, he has an odd way of looking at her which is not easily fathomed, but which proves quite as disconcerting as it may be unexpected.

THE END.

SAGHALIEN, THE ISLE OF THE RUSSIAN BANISHED.

By W. C. CHISHOLM.

IN these days when transcontinental railways and speedy ocean-transit have given a great impetus to travel, and enterprising spirits, led on by the love of adventure or bent upon the advancement of science or commerce, have pressed far afield from the beaten tracks into countries of which little save their names was known, it is no small distinction to be a pioneer-traveller and give to the world authentic information about peoples and places concerning which rumour had been busy, but which had been unvisited by the explorer.

Such a distinction has been won recently by Mr Charles Hawes, who in 1900 started on a tour which included India, Australia, New Zealand, China, Japan, and Siberia; and it was in connection with his explorations and investigations in Saghalien, or Sakhalin, that he made his mark. Fond of travel and gifted with an aptitude for languages, Mr Hawes had visited most European countries before he started on his long tour, which he undertook partly as a fitting complement to a university education, and partly as a valuable preparation for public life. Australia and New Zealand, usually neglected by the globe-trotter, who finds his chief fascination in the Orient, were included in his programme because there he hoped to see what an advanced democracy was accomplishing; whilst in India it was his purpose to study the working of a benevolent despotism modified only by the public opinion of a nation which believes in representative government. Only the fringe of the vast Chinese Empire was touched by visits to the treaty ports; and as illustrating the variety of its languages and dialects, of which those who have not travelled in the East have no conception, Mr Hawes mentioned to the writer the following incident. He was staying with a friend in the hinterland of Hong-kong when the latter had occasion to engage a second 'boy.' They were in Hakkaland, and he sent 'boy' No. 1 some ten miles to interview and bring along 'boy' No. 2; instead of which he returned, with tears in his eyes, to explain that he had not been able to make the other 'boy' understand: he spoke another language. The time available for Japan proved all too short for the traveller to compass his purpose of making even a hurried investigation of its government and administration, and of the industrial reform movement, so drawn away was he by the natural beauty of the country and the art productions of the people. Moreover, he was bent upon visiting Siberia; and to remain longer in the Island Empire would have meant his abandoning one of the chief items of his programme.

Siberia may not have an attractive sound for the ordinary traveller, but Mr Hawes included it in his tour inasmuch as he was anxious to solve the question whether or not the treatment of the exiles and convicts by the Russian Government was such as was depicted by the attackers or defenders of that administration. His study of the question had informed him that on the island of Saghalien, separated from the mainland by the Straits of Tartary and from northern Japan by La Pérouse Straits, he would find Russia's worst criminals, and had led him to believe that he would discover a state of things approximating to the condition on the mainland fifteen years ago. Further, there were primitive tribes on the island of whose history and habits next to nothing was known, and his leaning towards the study of ethnology confirmed him in his desire to reach them and place on record an authentic account of their manners, customs, and traditions ere they were overtaken by the well-nigh inevitable fate of the aborigines, whether in New Zealand or North America, who dwindle and die out before the steady advance of the white man. The story of what Mr Hawes saw in Saghalien is told in his most interesting volume, *In the Uttermost East*, and his is the distinction of being the first Englishman to penetrate into the north-eastern portion of the island and visit the Gilyak and Orochon tribes. For reasons which will be mentioned later, he was unable to visit any of the Ainu settlements.

Saghalien—or, to use the Russian official spelling, Sakhalin—means 'black,' and it is indeed a fitting name for the most notorious penal settlement in the world. Black are the crimes which brought large numbers of the convicts to that 'dreary isle of punishment,' black in many respects has the administration often been, and black are the prospects of those outcasts of humanity who have been deported to the farthermost portion of the empire, from whose sea-girt shores there is but the slenderest prospect of return. Its very name is under a ban at St Petersburg, and so evil is its reputation that to receive an appointment there is a stigma. The Russian occupation of the island dates from 1852, when its acquisition became necessary to guard the entrance to the river Amur, where the Russian flag had been placed in the previous year; and so inhospitable a spot was it, and such were the difficulties and dangers of navigating its coast and effecting a landing, that it was not until 1849 that it was discovered by Captain Nevelsky, who was searching for a naval base in eastern Siberia, to be an island. Up to that time it had been regarded by the civilised world as a peninsula and part of the Chinese mainland.

In size it is somewhat less than Scotland, having an area of about twenty-nine thousand three hundred

and thirty-six miles. Its extreme length is five hundred and ninety miles, whilst in breadth it varies from seventeen to one hundred miles. The greater part of the island is covered with primeval forests of such density that even the natives do not track them, but rely chiefly upon the rivers as their highways; in the summer traversing them in canoes dug out of the trunks of trees, in the management of which they are most expert, and in the winter travelling over their frozen surface in sledges drawn by dogs or reindeer. So sparsely is the country populated that on a journey to the east coast by the route most used by the natives, Mr Hawes for three days saw not a single person or dwelling. The heat in summer is considerable, and the winters are long and severe. Snow may be expected about the middle of October, and generally lies for one hundred and seventy or one hundred and eighty days. By the beginning or middle of November the Straits of Tartary begin to freeze, and are closed to navigation for about six months. Then, were it not for the cable, the inhabitants would be cut off entirely from the rest of the world until the ice was thick enough to allow dog-sledges to cross to the mainland; but as that is not possible, as a rule, until at least the end of December, and as the cable was broken for months before and after Mr Hawes's visit, the connection is at the best precarious, and the isolation sometimes complete.

Mr Hawes found that the climate of the country has been much maligned. Far from fogs being prevalent, as the reports of mariners had led him to expect, he discovered that, whilst they are very frequent at sea, a margin of four miles from the shore is generally clear; and during the seven weeks he was on the island there was not a single fog, and often the coast-line of the continent, sixty miles distant, was clearly visible. In fact, the average annual cloudiness and rainfall is much less, whilst the sunshine is considerably more, than that recorded in England.

Fish—especially salmon, which forms the natives' staple article of food—abound in the larger rivers. Reindeer, foxes, sables, and otters are found in considerable numbers, and wolves still exist in the south; but the most striking animal in Saghalien is the big brown bear, which plays an important part in the religious ceremonies of the Gilyaks.

According to the latest statistics available when Mr Hawes was there, the total population of the island in 1898 was about thirty-six thousand. Of that number only about one-eighth were natives, the remainder being Russian officials and convicts, and a few wives of prisoners who voluntarily had followed them to that terrible prison-land from which hope is almost wholly banished.

For administrative purposes the island is divided into three districts, each presided over by a chief, subject to the military Governor; martial law obtains everywhere. The Russian occupation, however, is really confined to those districts of which Alexandrovsk on the west coast and Korsakovsk on the south are the centres, whilst the biggest prison is at the former town, where the Governor resides. It was at Alexandrovsk that Mr Hawes had facilities such as had not been enjoyed by any European traveller for observing the everyday life of the convicts and the political exiles; and his impressions of the results of the penal system as it exists there, and the records of what he saw, form an intensely interesting part of his valuable book. The political exiles, it should be said, form but a small part of the population; and as they generally have been well educated and are quiet in prison, they are soon promoted, and find employment as doctors, school-teachers, book-keepers, or metallurgists. As, however, they are entirely dependent upon the caprice of the officials as to the places they are sent to, the posts they fill, and the remuneration they receive, their existence is precarious in the extreme, and many have the greatest difficulty in pulling through.

The Russian law with regard to deportation is severe. 'It provides that any criminal with a sentence of not less than two years and eight months, any woman (not exceeding forty years of age) with a sentence of two years and over, and any political exile (at the discretion of the Government) may be deported to Saghalien.' In 1898 the number of men and women on the island who had been sent out as convicts was nineteen thousand seven hundred and seventy and two thousand three hundred and ninety-seven respectively, and according to an invariable rule, they had been classified according to their sentences. Those who have sentences of twelve years or upwards are put into the worst or 'testing' prison. That class consists chiefly of murderers, and, sad to say, a considerable proportion are women. Executions, except for regicide, are very rare in Russia, and even in Saghalien the punishment for murder is seldom death save if the victim is an official, or if the culprit is a member of a desperate band of criminals, or if the crime has been carried out with exceptional brutality. The next class includes those whose sentence varies from four to twelve years, and they are placed in the 'reformatory' prison; whilst those whose sentences are less than four years are treated, after a short term, as 'free commands.' The ordinary course is for promotion, according to good behaviour, to take place from one class to another, the average length of service in each class being a third of the original sentence. One of the weak points in the system is that a large number of those who belong to the worst or 'testing' prison are kept in enforced idleness, and thus fall into yet deeper moral degradation; whilst others, under the charge of soldiers or of overseers who are ex-convicts, are sent to work in the coal-mines or on the jetty. The third class, or 'free commands,' are really men and women who are on 'ticket of leave,' and they go daily to the prison to have their work assigned. The best hope for a convict in Saghalien lies in his wife's following him; for should she do so he is at once transferred from

the 'testing' prison to a 'free command,' even although his crime is murder.

Another and most dangerous section of the criminal population consists of the *brodyagi*, or escaped convicts; and as it is by no means easy to track and capture them in the thick bush, to which they at once make their way, many succeed in eluding the authorities; and as they think nothing of committing a murder for the sake of a few kopecks or even a pair of old shoes, they are a terrible scourge to the island. Others, however, are soon forced by hunger to surrender themselves, whilst many fall into the hands of the soldiers or of native trackers, and, having no passport, are handed over to the officials. But even then, strange as it may seem, a few of them succeed in avoiding serving their long term of punishment by having made such a bold bid for freedom; for if the *brodyagi* cannot be identified and they profess to have forgotten who they are and from what district they came, they escape with a punishment of only four years! Is it much wonder, then, that the most desperate of the convicts are on the watch for an opportunity to escape, being willing to run the risk of a flogging and an additional sentence, which may range from a quarter to the whole of the original term, if they are identified?

Flogging for theft, attempts to escape, and deeds of violence is still in force, although the *knut*, with its six-foot thong and bags of lead attached, has been abolished. Women, according to the law, are immune from corporal punishment; but in Saghalien, if they provoke the resentment of brutal officials, they do not always escape it. Another peculiarly degrading form of punishment, abolished on the mainland, but still resorted to in Saghalien in the case of the most desperate convicts, is that of being chained to wheelbarrows day and night!

Though there is promotion from class to class and consequently some slight amelioration of the lot of the convicts, it must not be supposed that on the expiration of their sentence they are free to return to Russia. Nothing of the kind. The island is, indeed, one vast prison, and of those who are deported there not more than one in a hundred ever succeeds in quitting it. To be sent to it is, for most, an edict of perpetual banishment; for the ex-convict must remain in Saghalien as an 'exile-settler' for six years after his prison-days are over, unless he has the promise of employment on the mainland, in which case the chief of the district may grant him leave to go. But in Siberia he must remain yet another six years as a 'peasant,' and in no case can he return to Russia within twelve years after he has served his full term.

It is easy to understand what the moral conditions and atmosphere of such a community must be. Refining influences on the island, until recently, there have been almost none; for the Government makes no direct attempt to reform the convicts through the priests. Every year about sixteen hundred prisoners arrive, and the children born on the island are brought up amongst surroundings of the greatest immorality and crime. Neither person nor property is safe. Murder is committed on the slightest provocation and for the sake of the smallest gain; and in the frequent brawls of the 'exile-settlers,' even if life is endangered, the officials seldom interfere. If death results, what does it matter? There is one convict less! It was to the hospitality and tender mercies of such desperadoes that Mr Hawes often had to trust himself. A revolver was an absolute necessity, even if he was going only a couple of yards from his abode. Outside the town it was well to carry a rifle in addition; whilst on his journey to the north-east of the island, to which he was the first white man to penetrate, he and his interpreter, himself an ex-convict, were rowed part of the distance by two settlers of the lowest type, and it speaks volumes for Mr Hawes's nerve that he should have ventured upon so perilous an undertaking, although, with characteristic modesty, he declares that one soon accommodates one's self to such conditions and loses all sense of fear.

In his opinion most of the evils of the penal system, as it exists in Saghalien, are due to maladministration rather than to the defective state of the law. Its aims and provisions are not, on the whole, less humane than those of most civilised countries. But Saghalien is six thousand seven hundred and fifty-two miles from St Petersburg. Consequently, anything like effective supervision and control of the local officials is impossible, and the chief hope of improvement lies in the appointment of men of a higher type. Some of them, of course, take a high view of their duties, and are just, considerate, and clean-living; but the lax morality, the peculation, the harshness, and the indifference of the majority to the moral and physical welfare of the prisoners may be held mainly responsible for the terrible conditions in which most of them drag out a precarious and miserable existence.

The other purpose that took Mr Hawes to 'the isle of the banished' was to reach the native tribes and put on record authentic information regarding their customs, traditions, and religious observances; and on all these points he has written in a most interesting and graphic manner. In addition to the Russians, he found five different peoples—namely, Ainus, Gilyaks, Orochons, Tungus, and Yakuts; but of the last-named there were only ten men and three women. It is probable that the Gilyaks came over from the mainland before the Orochons, attracted by the abundant hunting that the island then afforded; but be that as it may, Mr Hawes ascertained that their traditions testify to their having found the Ainus already in possession. The latter, it has been conjectured, either came from Yezo, when the Japanese settlement drove them to that northernmost island of the empire, or the original emigration was from the mainland. The Ainus in Saghalien number about one thousand three hundred, and are settled in the southern portion of the island; but, greatly to his regret, our

traveller was unable to visit them, inasmuch as he could find no means of transport, and the Governor refused his permission. The Tungus, who are the best hunters, number about two hundred, the Orochons about seven hundred and fifty, the Gilyaks not less than two thousand; and it was to visit the two last-named tribes that Mr Hawes undertook a fifty miles' land-journey from Alexandrovsk and a perilous six hundred miles' journey by river and sea in dug-out canoes to the then unexplored north-eastern portion of Saghalien and back. The Orochons he found to be better hunters than the Gilyaks, and distinguished from them by the fact that they use their dogs only for hunting, whilst the Gilyaks use them for sledges, whereas for that purpose the Orochons use only reindeer. Many of them are still clad in fish-skins; but a sign that they have made greater advance than the Gilyaks may be found in their slicing their salmon and curing it over the fire in their huts, whilst the Gilyaks dry their fish in the sun, and thus are at the mercy of the weather for their store of winter food.

In appearance the Gilyaks resemble the North American Indians, but are short of stature as well as spare of limb, the men averaging five feet three inches, and the women some nine inches less. They are true children of the forest; agriculture is unknown to them, and for their living they are dependent upon fishing and hunting. Their year consists of six months, commencing in April and October. They have no written language, and the following legend to account for its loss is current in the tribe: 'A Gilyak and a Chinaman were talking together upon the shore one day. The former was showing his books and letters to the latter, when most unfortunately a great wind arose, and blew away all the letters save five; and, to complete the great catastrophe, when the Gilyak's back was turned the Chinaman made off with the small remnant.' News travels amongst them most rapidly in the mysterious way common to nearly all untutored tribes, and they have a tradition of a great flood which cut off the island from the mainland. Their religious rites are few and primitive. They believe in a future life, and worship as their chief deities the lords of the forest, sea, and fire, and the creator (or judge of right and wrong), before each of whom they must appear after death.

But even that land of moral darkness and abject misery—the home of primitive tribes and the prison of abandoned criminals—has not been left wholly without a ray of light. Some five years ago Miss Eugenie de Mayer, the daughter of a well-known Russian general and philanthropist, touched by their sad story and in the face of the greatest difficulties and hardships, left a wealthy home and all the social attractions of St Petersburg to minister to the material and spiritual needs of the convicts. She has received encouragement and support from the highest quarters, and little though a single worker can do compared with the most piteous and pressing needs of twenty thousand convicts, it is wonderful how much she has accomplished. Her coming has been hailed with delight by the roughest of Saghalien's worst criminals; and as illustrating her courage and devotion and the ascendency she has already obtained over them, Mr Hawes narrates the following incident. Unaccompanied by any of her sex, she went far into the interior with a gang of some two hundred convicts who had been sent under the charge of a handful of officers and guards to erect a telegraph-line through the primeval forest to a station in the south. One night as she lay in her small canvas tent she thought she heard voices, and on looking out, discovered two convicts, who, on seeing her, called out, 'All right, lady; we are watching to see that you come to no harm.' Even from the most hardened and abandoned some response may be expected to such devotion as Miss De Mayer's; and may her going to Saghalien on her work of good-will and mercy prove the dawn of a brighter day for the dreary isle of banishment.

THE EMIGRANTS' TRAIL.

THERE'S a path across the sea for the bold who would be free;
Lo! it stretches fair and wide before our eyes.
It may skirt the shining sands of some golden wonder-lands,
It may lead us where a Vale of Eden lies.
Would we read its hidden tale? Through the far horizon's veil
We must tread it, in the shadows and the sun,
With a steady step and strong, though the journey may be long,
For the goal is not too distant to be won.

It is gleaming clear and bright, with a sheeny silver light,
Fascination from that luring shimmer streams;
For each sparkle seems to say, 'Travel on this lustrous way;
It is trending to the haven of your dreams.'
Can we, timorous, turn back from that star-bespangled track
While the waters murmur 'Follow!' in our ears?
Hope's imaginings inspire in our veins an eager fire,
And the tide is rushing outward with our fears.

There are marvels over sea: lands for nations yet to be,
Buried treasures for the pioneer to win.
Fortune opens many doors on these distant sunlit shores;
They are wide enough for all to enter in.
In some vast, unhampered place we shall found a lusty race,
Potent players on the universe's stage;
And our children's sons shall be wiser, mightier than we,
We shall hand them down a priceless heritage.

SIXTH SERIES.

SAN THOMÉ, WEST AFRICA.

By a Resident.

THE one and only idea of the inhabitants of San Thomé, or St Thomas, in the Gulf of Guinea, is cocoa, which is likewise the only topic of conversation among them. Practically no interest is taken in anything else. Coffee grows well, and a certain amount is cultivated and exported; rubber also flourishes, and would probably eventually be more remunerative than cocoa or coffee. A plantation-owner will always acquiesce in the fact of its being so, but will invariably say that rubber requires much more care and labour than cocoa or coffee. With regard to rubber, the supply has not yet been able to meet the demand, and its cultivation should therefore be seriously considered. A few casual trees may be seen here and there, but no regular plantations of it.

The port of San Thomé is good as regards formation, but very shallow, and steamers with anything above a couple of thousand tons displacement have to anchor a good hour's pull from the shore, an inconvenience which one good dredger, if kept continually working, would do away with in a very short time. The bay is infested with sharks by no means small. Still, accidents are seldom heard of; presumably only natives supply an occasional meal to the ever-watchful man-eater, so the occurrence is taken no notice of. The town of San Thomé itself is most unhealthy, owing chiefly to want of sanitation, and partly to the Government not seeing their way to covering up or filling in the existing marshes. Native huts are allowed to intermingle with European houses, which are themselves in anything but a sanitary state, and therefore the multitudinous variety of odours one encounters during a walk through the town is appalling. There is absolutely no drainage at all; the refuse is thrown on the beach; stagnant waters are allowed to adorn the gutters of the roughly paved streets. Consequently malarial fever exists to a great extent, and yearly one hears of cases of black-water fever, which is about the most fatal form of malaria, but luckily by no means so frequent as the latter. Beri-beri also exists, chiefly among the natives, and a good many of them have of late been victimised by this dreadful disease. Its existence in the island is attributed to the importation of Chinese labourers some years back, and it has ever since made its presence felt with an increasing tendency. The extremely insalubrious habits of the natives, who, sooner than call a doctor, allow the patient to die, greatly assist in the propagation of the disease, the death of one of them being a good excuse for a feast, with drinking and dancing; the feast generally ending up with a fight, in which very frequently the knife comes into play.

The native of San Thomé is a character apart from other Africans. Although fish abounds in these waters, it is one of the most expensive items of daily food. A native will go out in his small dug-out and catch one or two fish weighing four to five pounds each, for which he will probably get eight to ten shillings. This money will keep him in food and drink (more of the latter than of the former) for about a fortnight. Work he certainly will not until his money is finished. They are a bad and treacherous lot, and to be avoided as much as possible. There seems to exist a certain strong magnetic attraction between their fingers and all purloinable articles; they cannot resist the abnormally strong temptation to steal. The cocoa-plantations are in ninety cases out of a hundred worked by natives of Cape Verde and Angola. Hundreds come by almost every ship under some kind of contract which they sign, and which, from the fact of San Thomé being an island, they are almost bound to fulfil, the alternative being starvation or stealing, which they know perfectly well must sooner or later bring them within the grasp of the law.

There are no boats for hire. Five or six business firms have them for their own use, and an application for a seat in a boat to go on board a steamer will often be met with the reply that they can supply the boat if the applicant can supply the 'boys' to row!

[*All Rights Reserved.*]

The crews of the Government port-boats consist of natives from Cabinda in Angola, who are considered good and hard-working, and they certainly look it physically, being strong, well-developed men, and always happy. Cooks and house-servants are likewise imported from Cabinda. Occasionally an Accra or Sierra Leone 'boy' is to be had. These 'boys' also supply the needs of a European, being hard-working and fairly honest. Their strong recommendation is that they have no relatives near them, and are not on friendly terms with the natives of San Thomé. In walking through the town one is occasionally greeted with a 'Good-evening, sah,' denoting at once the presence of an Accra 'boy.' They are very handy at most things, and can, should the cook be ill, take his place, and turn out the most extraordinary culinary concoctions imaginable, even to serving up liquid bread-and-butter puddings in claret-glasses. Quite lately one of them, in a European's house here, produced a most extraordinary soup and stew. When called in to explain, he said that the soup was Spanish and the stew Italian. His master then told him that the next thing he would become acquainted with would be a Portuguese thrashing if he again attempted to indulge in such high-class cookery!

The writer had occasion lately to visit the most up-to-date cocoa-plantation, and was able through the courtesy of its manager to see all the interesting stages of cocoa production. The scenery up in the hills is magnificent, the predominating plant, of course, being cocoa. Still, one sees hundreds of rubber, coffee, avocado-pear, coco-nut, tamarind, and mango trees, besides other huge and tremendously high kings of the forest, from the trunks of which enormous dug-out canoes are made and used for carrying from twenty to thirty bags of cocoa to the outlying steamers. Thousands upon thousands of little green parrakeets or love-birds are to be seen, many of which are caught and sold, on the property in question.

Six hundred natives are employed, housed, fed, and dressed, the latter item not being a very heavy one. They are well looked after, and are often given better habitations than many a white man has reason to expect or dreams of possessing in most of the Congo towns. On Sundays a bullock is killed and distributed among them in the form of a stew, with potatoes, paw-paws, beans, &c., and rations of money are doled out to every man and woman. It is interesting and amusing to see these hundreds of natives, all in gaudy garments, answering to their names, which consist in most cases of articles of dress or short expressions, such as 'Mr Don't-go' or 'Mr Trousers,' of course expressed in Portuguese, which is the language they more or less understand; but even in British places on the coast such names as 'Mr Half Day Dollar,' 'Mr Come Quick,' &c. are by no means uncommon. The writer happened to notice two natives tied together by a yard or two of rope. On his questioning the manager, the latter said there were two couples like that, and surely enough the second couple turned up just then. It happened that the first was an inveterate drinker of palm-wine, and although he had made many promises to improve, and had been set free dozens of times, he always broke his promises, and could not be kept sober when at liberty. All his companion had to do was to follow the would-be inebriate wherever the latter chose to go, the captive carrying double loads, his own and his keeper's, as a punishment. The other case of double-harness was of a more comical nature, the prisoner in this instance being periodically mad. The manager used to find dead poultry almost daily, and could not understand the cause of it. Discovering two dead geese one morning, he thought the time had come for investigation, and determined to watch on a moonlight night. He had not long to wait before he observed a native with a short stick in his hand stalking a duck round and round most perseveringly until he actually ran it down through sheer fatigue. The native then quietly administered two or three sharp taps on the duck's head, and started dancing round it, accompanying his dance by a monotonous song, every few minutes taking a rest by sitting on the dead duck. The manager, after watching this queer performance for some time, decided that his turn had now come, and approaching the native, he gave him a thoroughly good thrashing, and next day supplied him with a sturdy companion attached by a rope. Many are the amusing stories told by these experienced dealers with the natives, but they are far too numerous to quote, and in most cases point to their thoroughly bad character and to their hatred of the white man.

GIANT CIRCUMSTANCE.

CHAPTER XIX.—AN ALIEN FACE.

CARRICK and Brading tramped on for over an hour along the sides of the hills, with the blue sea below on the left. It was very rough walking, for every now and then they came to deep cleavages in the hillside through which streamlets cascaded through ice-rimmed banks to the sea; and if the streams were small, their ages-old channels were deep and wide out of all proportion. And the climbing down into these and the climbing up again took time and called for caution. But the slender, trampled path led them on, and where it went they followed.

'Ah, there we are!' said Geoff at last, as they came in sight of a white cottage some distance ahead. 'I thought we'd come to something in

time. We'll just take a look at that and then go on over the hill.'

It was a fair-sized cottage, standing all by itself in a little break of the hill, with a wide outlook over the sea and just a glimpse of the turret of the big house on the rock. There was a thick belt of firs behind it to ward off the cold north-easters when they came shrieking down the glen, and there were evidences of a garden under the snow.

Carrick tapped on the door, then knocked more loudly, but got no answer. He scrutinised the windows carefully, but the curtains drawn across inside permitted of no discoveries. And yet in his own mind he felt certain that, as he glanced that first time at the distant cottage, the darkness of the window had been momentarily lightened by what undoubtedly suggested itself to him as an out-glancing face. But now the windows were all blind and dark, and the place was apparently tenantless.

He knocked once more, and then turned and went off through the firs.

The rough little glen brought them out at last on to the side of one of the western hills overlooking the dappled, ice-and-snow-bound loch, where dwelt, according to local tradition and Mr Duncan Cameron, the fearsome beast that cried ill-news by night.

'If Mr Kelpie lives in there I don't quite see how he got out and in again last night. Do you, Tom?'

'Unless 'twas by one o' them black spots, sir,' said Tom, with evident inclination towards an open mind rather than to any definite, and possibly exasperating, implication of impossibility where such things as kelpies were concerned.

'Tuts, man! Those are only where the wind would not let the snow lie. I'd like a couple of hours on that ice. It's not often one gets such a chance nowadays;' and he seemed half-inclined to send Tom back, there and then, for the skates that had been waiting four years to be fleshed.

However, he contented himself for the moment with a walk on the ice when they scrambled down to it, and some vigorous stampings to test its strength, and then tramped on by the side of the loch towards the fairy glen.

And, strangely enough, as they stumbled down the slippery rock-path, Carrick once more got the strange, fleeting impression, between two blinks of an eye intent at the moment on nothing but safe footing, of a dark, startled face somewhere in front of him.

He stopped as quickly as circumstances permitted, and stood stiff as a pointer, examining intently the hollows of the rock-walls ahead and the tangle of frosted lacery below. Surely, he thought, it must be some patch of lichen, or some chance combination of tree-trunk and branches, that conveyed the impression. The curious point about it, however, was that this was the second time it had happened.

He said nothing to Brading, for Tom, if he had seen anything unusual, was certainly in no state of mind to keep it to himself; and, discovering nothing with all his looking, Carrick went on down the terrace that ran round the hillside.

The mouth of the old boring seemed just as he had left it. But his senses were quickened, and he noticed what, under ordinary circumstances, might not have attracted his attention.

The water from the mine still trickled across the pathway and went to lengthen the icicles that hung over the outer ledge; and, unless his eye deceived him, the water that was coming out of the hole just then was discoloured and full of sediment.

He hesitated for one moment, with a not unnatural disinclination to tackle a mystery in the bowels of the earth and in so circumscribed and uncanny a place.

'Those candles, Tom!' and he lit one and went boldly in, with Tom at his heels and devoutly wishing he was not. For Tom had no hankering after mysteries, but only a faithful, not to say prudent, inclination to keep very close to his master under present conditions.

They made their way without difficulty along the rough tunnel, with water dripping deliberately from roof and sides, and oozing slowly between the rusty iron rails on which they did their best to walk; and so they came at last to a point where trial-shafts had been run in various directions, and the ground was ankle-deep in damp slush. Three of these borings they tried to their extremities, which were, indeed, no great length. The fourth, which vanished into the darkness to the left, was much longer; but just when Carrick was beginning to hope it might really lead to something, they came suddenly face to face with a stout barricade of unbarked fir-poles with cross-ties of the same, which effectually barred their progress. They put shoulder to it and did their best to break it down with their feet, but in that confined space power was limited, and at last, to Tom Brading's great satisfaction, Carrick gave it up as a bad job, and they crept back to the open.

He would see, however, where the terrace led to; and, following it, they came presently over a buttress of the hill into a small bay with a very curious formation at the head of it. For the head of the little bay consisted of a sheer rock-wall standing straight up out of the sea. The top of it was flat like a table, and was covered with short herbage, on which the snow lay lightly. It was evident from the appearance of the rock and the cliff that at some time or other the cliff-top, overhanging perhaps, had toppled over into the water, for the under-part of the cliff still arched outwards, and, at a point, the flat table-top rested against it. Subsequent detrition had filled in the spaces between rock and cliff. Ages of wild Atlantic fury had welded

these together, so that now the pediment of the table was a concrete whole, bitten and honeycombed indeed, but solid and impervious as the mother-rock itself.

'Capital place for a picnic, Tom,' said his master; and they scrambled down till they stood on the table-top, with the waves washing its base sixty feet below.

'Want better weather, sir,' was Tom's matter-of-fact suggestion.

'Yes, better weather would be—— What's that?'

For from under their feet the solid rock seemed to give forth sounds: dull thuds, metallic clinkings, blows as of great hammers.

'Curious!' said Carrick, after listening for a time. 'It's the water, I suppose, in among those holes below. As you say, Tom, for picnicking purposes warmer weather would be desirable. There's a village somewhere over there that I want to see, and perhaps we can get a bite there.' And they scrambled up the cliff again and went on towards Innisrath.

The village was, as old Donald had said, just a number of scattered houses with crofts about them, and the dark-eyed woman in the first house they came to responded to their request for something to eat by setting out oatcakes and cheese and whisky, all of which they found exceedingly good.

The housewife's English seemed limited, for her one reply to all questions was, 'Ay, jist thaat!' or a shake of the head if the other seemed wide of the mark; and so no great reliance could be placed on her information that the men were all away at the fishing, that the whisky was home-made, and that her oatcake was the best on the island. She flatly declined payment for her hospitality, and Carrick had to get round her by surreptitiously placing a shilling in each hand of a wide-eyed youngster who reconnoitred them from behind chairs in profound astonishment, and whose fingers closed on the coins by instinct.

Then they set off for home along the eastern shore of the island, struck up the first corrie that led westward, and so came down through the pines and firs to the black-and-white loch, and tramped back along the opposite shore from the one they had come by in the morning.

They did not meet a soul till they had rounded the head of the loch and were turning into the glen that led to the sea, and the person they met there was somewhat of a surprise to them.

He was a slim, under-sized man, dressed in thick pea-jacket and blue trousers stuffed into big sea-boots. His blue cloth cap was pressed down over his brows, and his coat-collar was up to his ears, as if the cold was not congenial to him. His head was down, and he was pressing energetically up the glen, and it was not till they were close upon him that he caught sight of them. And, as he did so, it seemed to Carrick that he gave a start of surprise or annoyance, and slacked his pace to the simulation of a stroll.

His face was thin and swarthy, his eyes and hair coal-black. Not a bad-looking face, Geoff thought, except inasmuch as the Latin type of face carries, as a rule, no overpowering conviction of straightforward honesty to the bluff Teuton. He took a good look at it as he passed, for, as laird, it behoved him now to know what went on in his own land. And, assuredly, this man was not of the soil, though he might, indeed, be distantly connected with it through that strange old-time link which dated back to Armada times.

He bade the stranger 'Good-day,' and received a murmur in reply.

'Well, Tom, what do you make of that young man?' he asked.

'Frenchman, I should say, sir, unless he was I-talian,' said Tom, whose studies in ethnology had been limited.

'Not a native, you think?'

'Not by a very long chalk, I should say, sir. If he is, they must be a rummy, mixed lot.'

'If you can learn who or what he is from old Donald, let me know. I don't want to seem to be poking too much into private matters; but that fellow certainly seems a curiosity.'

'I'll try and pump old Sawnie, sir; but he's not what you might call over-talkative at best of times.'

(To be continued.)

THE APPLE INDUSTRY OF TASMANIA.

By F. A. W. GISBORNE, Castle Forbes Bay, Tasmania.

THE Tasmanian apple has probably by this time lost its novelty, though we will hope not its charm, to the public of Great Britain. The large and increasing quantities of fruit that are now being exported from this remote corner of the Empire to its great capital must enable the London street arab as well as the alderman to obtain an occasional taste of Tasmania in a rosy and succulent form. As a resident for some years in the heart of the chief apple-producing district of Tasmania, I propose to give a brief description of an industry which combines in a large degree pleasure with business, the picturesque with the profitable; and which, from the many opportunities of self-advancement it offers to the intelligent and industrious, might well attract some enterprising denizens of overcrowded rural districts in England.

Possibly Tasmanian geography is less familiar to

people at home than Tasmanian apples. A brief sketch of the district to which the heading of this humble contribution refers may, therefore, be appropriate. The district generally called the Huon, from the river of that name which flows through it, lies in the south of the island, some twenty-five to thirty-five miles south-west of the capital. The orchards extend in a long, narrow strip on both sides of the river for about ten miles, with detached patches here and there scattered among the hills at the back where the land is suitable. The chief centres are thriving little townships called Huonville, Franklin, Geeveston, and Lovett, the first-mentioned lying about twenty-five miles up the river, and the last on an extensive branch of the Huon estuary, not far from its mouth, called Port Cygnet. Franklin and Geeveston—the former named after the heroic but ill-starred Arctic explorer, at one time Governor of the colony, and the latter after an enterprising north of England family that emigrated thither many years ago—occupy intermediate positions on the right bank of the river, Geeveston extending some distance back along the valley of a small tributary called the Kermandie. The doubtful or inquiring tourist tramping, or rather wading, along its muddy streets might safely accost any passing stranger in Stanley's famous fashion: 'Mr Geeves, I presume?' and find his presumption verified.

An oasis of smiling orchard-land encircled by a gloomy ring of dense forest, gradually widening under the successive attacks of woodmen and pioneers, with the Hartz Mountains, snow-capped the greater part of the year, extending in a long, irregular line to the west, forms altogether a very charming scene. Franklin, ten miles away to the north, is far less picturesque, though the town itself is the oldest and still the most populous in the whole district. Its single long, narrow street winding along the river at the foot of a steep hill presents to the eye an unpleasing combination of the old and the new colonial styles of architecture. Bald, two-storied brick houses, more or less plastered, and resembling a common type of village inn at home, stand side by side, with trim wooden bungalows brightly painted and cheerful. Along the river-front unsavoury mud-flats are exposed at low-tide, and the shore bristles with tumble-down wooden jetties, built to accommodate the first generation of settlers, but no longer required. Still, the place is prosperous, possessing several large stores, a factory where apples are literally cut and dried, a couple of doctors, and twice as many clergymen, with their respective places of business. Hotel accommodation is somewhat beyond the requirements of the place, though the half-dozen coaches that pass daily, and more than as many weekly steamers, deposit during the summer months a fair number of travellers. Huonville, however, five miles farther up the river, is the beauty-spot of the district. The streets of the township, or rather village, are wide, and planted with trees; and the houses, each with its orchard, large or small, attached, are scattered about with charming diversity. The valley of the Huon here opens out into an extensive basin surrounded by wooded and beautiful hills, and the low ground in spring-time is covered with a chequered carpet of apple and pear blossoms, forming one of the loveliest sights imaginable. Being above tidal influences, the river flows along in a fine stream some fifty or sixty yards wide, overhung with willows and native shrubs. It is the delight of the angler as well as the lover of nature, for salmon and trout abound in its waters, and many a fine fish twenty pounds and upwards in weight is landed during the fishing season by local and visiting fishermen. Apple-growing is, however, the great business of the inhabitants of all the townships I have mentioned, and I propose now, having briefly described the district, to give a short general description of the industry.

The total area of orchard-land in the Huon district now in full bearing probably exceeds three thousand acres. Several thousand acres more will become productive in a few years' time; for since the business has become profitable an immense number of young trees have been planted out, and every year more are being added. In the early days of the industry, before the English and Australian markets had been developed, apple-producers found their occupation a very precarious one, the local demand for their products being small and fluctuating. Some men, I have been told, actually cut down their apple-trees and turned their orchards into pastures, thinking success hopeless; while but few thought it worth while to plant out extensive areas in the hope of finding a profitable market later. At present the average size of the orchards is but small—some eight or ten acres each. The largest orchardist in the state, whose property is situated in the valley of the Derwent, has one hundred and thirty-seven acres of orchard-land; while two other members of the same fortunate family possess nearly two hundred acres in addition of productive plantations. The largest apple-producer in the Huon district possesses nearly eighty acres of orchard; and a considerable number of properties, averaging from forty to fifty acres, are held by individual growers. The great majority of the latter, however, possess much smaller holdings; indeed, five or six acres of good orchard-land is considered quite enough to keep a family in comfort.

The land on which apple-trees are raised is of but medium quality. A clay subsoil—this is considered indispensable—with a light covering of sandy loam, is all that is required; but in a well-managed orchard a little bone-dust, about two hundredweight to the acre, is usually applied every second year. In its natural state, land well adapted for orchard purposes is by no means inviting in appearance, being covered with the usual scraggy and unsightly gum-trees that grow alike over valley and mountain. Such land is sold by the Govern-

ment as second-class land, and can be obtained at the modest sum of ten shillings an acre, a similar amount in addition having to be expended on improvements within a fixed period of time; but to clear it thoroughly, fence, and plant it costs quite fifteen pounds an acre more, and no appreciable return is derived for six years. Some men, it is true, grow various crops, such as hay, oats, or small fruits—raspberries, strawberries, &c.—between the rows of apple-trees while the latter are growing, and so pay their way; but this method of cultivation tends to weaken the young trees and lessen their future productive power. If situated on low ground, thorough draining is a necessary and expensive requirement to a good orchard; but the hilly nature of much of the country makes it easy for an intending orchardist to select a piece of ground where the natural slope will obviate the necessity for such operations. The trees are usually planted one rod apart. Some planters have as many as two hundred trees to the acre, but one hundred and sixty are considered by most experienced men to be a quite sufficient number. Where the trees are planted too close the soil is apt to become exhausted the sooner; the dense foliage retards the ripening of the fruit by excluding the rays of the sun, and there is considerable difficulty in ploughing and harrowing the intervening spaces. Labour being both scarce and expensive—thirty shillings a week represents the minimum wage of a competent man—as little hand-work is done as possible, the hoe only being used just round the roots of each tree. A very large number of varieties is grown. At a recent exhibition in Hobart one grower alone showed two hundred and fifty-three different kinds of apples; but the general opinion is that only, at most, ten or twelve are worth cultivating for profit, the chief requisites, of course, being good flavour, capability of standing a long sea voyage, early maturity, size, attractive appearance, and immunity from the attacks of insect and fungus pests. New York pippins (also called Cleopatras), Scarlet Pearmains or Nonpareils, Alexandras, Ribetons, Sturmers, and Jonathans seem to be considered the favourite varieties; though for powers of production the apple called the French crab is highly esteemed. It is usually advisable, I may add, in laying out an orchard of any extent, not to plant trees all of one kind, no matter how good; for when the fruit matures it may be impossible to obtain a sufficient amount of labour to gather it before it becomes too ripe for sending any distance. A gale of wind, too, at such a time might entail the loss of hundreds of pounds' worth of fruit.

To make an orchard a profitable possession attention to pruning and spraying is absolutely necessary. A single year's neglect in these matters might practically ruin the most valuable property. Pruning is one of the orchardist's chief employments during the winter months, and the traveller passing through a fruit-growing district about the months of July and August hears the constant click of the pruning-scissors as he passes each orchard. What is called 'spur' pruning is the favourite method adopted in southern Tasmania. Only fruit-buds attached by short, thick shoots to the main branches are allowed to remain; the longer twigs are all lopped away. The branches themselves are trained so as to grow upwards rather than outwards, for evidently the lateral branch is apt to break or droop under the load of its fruit, and also greatly impedes the ploughman in working the ground beneath. The foliage must not be allowed to be too dense, otherwise the apples will not sufficiently colour or attain their full flavour; but enough leaves must be left to keep the tree in good health and prevent the soil beneath from drying up too rapidly. Above all, the tree must not be allowed to bear too prolific a crop of apples in one year, for not only will the fruit in such case be small and of indifferent quality, but the tree itself will probably require a year or two to recover from its exhaustion. Various estimates have been given me by good practical judges of the amount of fruit a full-grown apple-tree should be allowed to yield year by year, the average being about five bushels. Individual trees have been known to give astonishing returns—as much as twenty-five bushels in a single crop; but the yield of the vast majority of the trees in a large orchard averages less than ten bushels apiece in the best seasons, and generally, allowing for those that only bear intermittently, falls considerably short of that quantity. Pear-trees in the Huon district thrive wonderfully. Two that were planted in the early days in the garden of an old resident of Franklin produced in a recent year one hundred and five bushels of pears, all of marketable quality.

The enemies the Tasmanian orchardist has to contend with are numerous. Insect pests such as the codlin-moth, pear or cherry slug, mussel-scale, and various kinds of aphides make havoc among the orchards if their depredations be not checked by spraying. Fungus pests in damp districts like the Huon are even more troublesome, black spot and bitter pit, the former especially, being exceedingly prevalent. Constant spraying with various mixtures, such as Paris green, Bordeaux mixture, red oil, and a mixture of kerosene and soap, is found to be the best preventive against the ravages of these pests. The parasite *Ephialtes carbonarius* is being cultivated to clear the codlin-moth from the orchards of California, and might be as useful here.

Between the months of February and June apple-picking is in full swing. From daylight to dark hundreds of men, women, and children are engaged picking fruit for conveyance on rough sleds drawn by horses to the packing-houses. On every large orchard the packing-house, or 'store,' as it is generally called, is a substantial wooden building some forty or fifty feet long by twenty or thirty wide often with a second story where boxes are made

inferior fruit stored, &c. The apples when brought in are sorted and graded with wonderful expedition, each class of apple being thrown into a canvas trough and neatly fitted by the packer into its respective case. The speed with which the operation is performed is marvellous. An expert packer will fill a hundred cases with wrapped apples in a day of eight hours, though seventy is considered good work. The rate paid for packing is usually one penny per case, so from six to eight shillings a day can be earned by a skilled hand. Women, I may add, are frequently employed in this capacity, and earn from one pound to thirty shillings each per week during the busy season.

The operation of packing is less simple than it looks, as a novice would soon find. It is very trying to the wrists, and standing for hours at a stretch in a cold shed (for fruit-stores are never heated lest the fruit should be damaged) is exceedingly wearisome. The arm of the expert packer seems to work with machine-like precision. Seizing a piece of paper in one hand, he grabs an apple from the heap before him with the other, and the moment his hands meet it is enveloped in the wrapper, and in half a second more neatly fitted into its place in the box. It requires great sureness of eye to select at a glance an apple of just the size required. Three are generally packed abreast, and they must exactly fill the width of the case, otherwise the fruit will receive injury through the shaking it must undergo in the course of its journey to market. Only the apples intended for England or some other distant country are wrapped in paper. Cases destined for nearer markets are merely lined with newspapers, and the apples are then fitted in as close together as possible.

Men engaged in supplying timber and making cases for the export of apples usually do a very good business. Of late years the demand for what is called box-timber has increased so enormously that the local sawmills are now scarcely able to satisfy it, and several unfortunate fruit-growers this year have been obliged to keep their fruit for several weeks after it was fit for sending away, the result being deterioration and considerable loss, through the inability of the sawmill owners to supply their wants.

For a very small community—the whole population of the island, it must be remembered, is not more than a third of that of Birmingham alone; and certainly not more than one-twentieth of the people, say ten thousand at most, are engaged in the industry now dealt with—Tasmania may feel proud of her achievements in fruit-production. Besides several thousands of tons of jam, dried and preserved fruit, pulp, &c., it is estimated that the state will export this year about a million and a half bushel-cases of apples, rather more than one-third of the whole quantity being sent to England, and the greater portion of the rest to Australia. Twenty-seven large steamers will have left Hobart for London and Liverpool ere the season closes, carrying from twelve thousand to forty-five thousand cases apiece. Roughly speaking, as their share of the proceeds derived from the sale of this large quantity of fruit, excluding the much larger amount that will be sent to various colonial markets, the Huon apple-growers expect to receive about one hundred thousand pounds clear, and probably a quarter of a million sterling would not be an excessive estimate of their total receipts for the season. Of course prices fluctuate and accidents happen; but the Tasmanian agriculturist, like his English brother, though eloquent in adversity, is extremely reticent in prosperity, so it is hard to derive exact information as to his actual profits. In one exceptional instance, I have been told, the owner of a remarkably good though small orchard received over three hundred pounds for the crop off five acres, the purchaser taking the fruit as it hung from the trees, and performing all the work necessary to prepare it for market. Other apparent signs of prosperity are to be seen. New and attractive residences are rapidly springing up, and many men who twenty years ago made a laborious living by cutting timber for sawmills now indulge in such luxuries as well-equipped buggies, ninety-guinea pianos, yachts, and oil-launches. Thank-offerings, too, in the form of chapels and churches appear in every orchard district; and I fear the establishments that supply spirituous consolation are attended by yet larger congregations of votaries every Saturday night.

No signs of destitution are to be seen. The very rarely seen tramp is quickly snapped up as he saunters along the road, and set to work picking up 'bag' apples or windfalls to be sent to the local drying-factory and sold at one shilling per bushel. He cannot well starve, for he can eat as many apples as he pleases. I fear, by the way, the thrifty eye would be shocked by the wasteful manner in which fruit is disposed of. The very children when sent to school are usually supplied with half-a-dozen or so rosy apples apiece to flavour their bread and jam or sandwiches; and they seldom honour a single apple with more than three bites. A story is told of some potentate several centuries ago who entered a large monastic school in Switzerland and ordered a basket of apples to be upset on the floor to test the discipline of the students. The latter, it is said, calmly went on with their work, paying no attention whatever to the incident; whereupon the august visitor, delighted with their application, bestowed a substantial endowment on the school. Such a test applied to a school in south Tasmania would not be a very severe one. The pupils would hardly think it worth their while to stoop to pick up apples even in the playground. They have, indeed, rather too much of this kind of work to do at home.

Let me conclude with a rough summary of the practical inducements offered by fruit-growing in Tasmania. At the outset, it is as well to repeat, the new-comer must be prepared to follow Long-

fellow's advice. He must both labour and wait. The cost of land suited to the industry is but trifling—if taken up from the Crown only ten shillings per acre; but clearing, fencing, planting, &c. will probably bring the cost of his orchard up to from twelve to fifteen pounds per acre. Some orchardists consider the latter figure rather too low; but of course a great deal depends on good management. The immigrant entirely destitute of all knowledge of agriculture would certainly do best if he worked as a cadet or apprentice on a good orchard for a year or two before he started in the business himself, for a man without experience would be certain to make serious and costly mistakes at first. If we assume he has gained a little local knowledge, five hundred pounds should be enough to enable an industrious man to begin with. A ten-acre orchard would cost him, say, one hundred and fifty pounds; and a similar sum might be devoted to building, laying down a grass paddock, buying a horse and cow or two, &c. He would have to pay his way somehow for six years until his orchard became profitable, but he would find little difficulty in getting employment from time to time, and a dairy or a plot of raspberries and strawberries would greatly help him along. Additional ground might be prepared for planting apple-trees meanwhile, and his original orchard gradually enlarged. As to the profits, commencing in the seventh year, each tree should average at least three bushels a tree, or about five hundred bushels of saleable fruit to the acre, which, at half-a-crown a bushel—a very low price—would give a return of sixty-two pounds ten shillings per acre, or six hundred and twenty-five pounds from the whole orchard. Expenses would take perhaps 50 per cent. off this amount, but a substantial balance would even then be left. A very good authority told me that a well-managed orchard, ten years old and upwards, should average six bushels of apples per tree every year; and this, taking the average selling price at half-a-crown a case, would represent the large return of one hundred and twenty pounds per acre, without deducting expenses; but many orchardists would regard this as an excessive estimate. If we adopt that before given, a well-kept orchard of ten years' growth should give its owner a clear annual return of from twenty to twenty-five pounds an acre, probably more; and when one considers the advantages other than pecuniary that the occupation offers—a healthy and charming climate, delightful scenery, fairly cheap living, and work highly interesting in itself and free from many of the irksome and laborious duties of the ordinary agriculturist—it may be confidently stated that to the intending emigrant from Great Britain the fruitful and salubrious valleys of Tasmania offer at least as many attractions as are presented by the veldt of the Transvaal or the prairies of Manitoba.

DIPLOMACY.

By Arthur O. Cooke.

IN TWO CHAPTERS.—CHAPTER I.

'AUGUSTA, my dear, we must settle this business of the living at once.'

Sir John Fortesque had just seated himself at the breakfast-table and chipped an egg as he spoke. Both speech and action had a brisk decision that seemed perfectly in keeping with the baronet's appearance—that of a well-built, broad-shouldered man of sixty-five or more. Keen gray eyes gleamed from below bushy eyebrows, a pair of closely trimmed 'mutton-chop' whiskers framed cheeks in which good health glowed ruddily, and full but firm lips disclosed teeth which owed nothing to art. A gentleman of the old school this—a Tory and a John Bull: fully convinced that Old England was the finest of lands, his native Bordershire first of her fair counties, and his own particular estate of Bredon Court the most perfect example of good management to be seen therein.

The lady seated behind the gleaming silver of the breakfast equipage bore her burden of sixty years with ease and grace. Time had contented itself with whitening the thick masses of hair which framed a fine oval face, and had left untouched that rare beauty of complexion which had made her the belle of the county in her *debutante* days. The broad white brow was unfurrowed and the quiet brown eyes undimmed. Women sometimes said that Lady Fortesque had had an easy life; into the question of how far that ease was due to her sweet serenity of temper, gracious manners, and never-failing tact they did not always enter.

'We must settle the matter at once,' repeated the baronet, throwing the top of his egg to a fox-terrier who sat with an air of confident expectancy at his side.

'It is really time, John. Four months now since Mr Halling died. Variety is charming, but I am getting rather tired of these constant "supplies."'

'So am I too, my dear. But whom are we to have? That is the question.' A slight testiness crept into the good-humoured fullness of Sir John's voice as he spoke.

'Well, John, as you have quite decided against

Frank Maddison, the only alternative is to settle on some one else. There ought not to be much difficulty in disposing of such a good living. How would you like Mr Seaton? I fancy he might not be averse to a change.'

'Seaton! Why, he's always quarrelling with his churchwardens. You know that, my dear, as well as I do.'

'Well, he would not bring them here, you know; perhaps he would get on better with Martin and Passey. I am sure poor Passey speaks the truth when he says he's all for peace and quiet.' Lady Fortesque smiled as the stout figure of the asthmatic and peace-loving parish-warden rose before her.

But her husband shook his head.

'We won't risk it,' he said decisively. 'I've led a quiet life here for forty years, and I don't want to end with any fireworks. We'll leave Seaton where he is. Think of some one else, my dear.'

'There is Sir Charles Wilmot's youngest son.'

'He's a fool, like his father.'

Lady Fortesque laughed softly.

'Poor Percy! he is not overburdened with brains, I am afraid. But will not the thought of Louisa Wilmot's gratitude move you to pity? She would be your slave for life. Only last week she was telling me what a wretchedly paid curacy he has. Percy is her favourite, you know; and with him snugly settled, she could concentrate her energies on a husband for Hilda.'

'She must continue to divide her energies, my dear. She'll succeed, I've no doubt. Always wanting something, and always getting it, that woman is.'

'Not *always*, John!'

The baronet leaned back in his chair with a jovial laugh.

'Ha! ha! ha! Gad, what a narrow escape I had! But we're not getting on, Augusta.'

'There is Mr M'Vittie. The living at Claughton is very poor.'

'No, no. I'm not prejudiced—not a bit; but let's keep to Old England.'

'Mr Lascelles, then, of Overton. There you have a Bordershire-man born and bred.'

'Yes, and a Bordershire woman into the bargain. His mother rules the whole parish and him too. Put him into the rectory, and I vow she'd be telling me how to farm before a month was gone.'

'She's a masterful lady, I admit. However, there is Mr Beavan; he is an orphan and a bachelor, and has neither kith nor kin that I ever heard of.'

Sir John set down his cup and gazed at his wife in undisguised astonishment.

'My dear Augusta, do suggest something reasonable. The man is not a gentleman.'

Lady Fortesque folded her serviette and slowly rose.

'Really, John, I fear I am at the end of my resources. It seems our clerical acquaintance is not very extensive after all. I have, I think, quite run through the list. But there is another way out of the difficulty: allow the presentation to lapse to the Bishop—or, rather, ask him to choose a suitable man. He would be more than pleased to do so.'

'I've no doubt he would. Much obliged to him—and to you, my dear—for the suggestion. But I'm not quite on the shelf yet, and I think I can dispose of my own patronage.'

The baronet's tone betokened as much displeasure as he ever allowed himself to show to his wife. Lady Fortesque laid her hand gently on his shoulder.

'My dear John, it was only a suggestion, quite as a last resource. Think the matter over, and I am sure you will be able to decide satisfactorily. Only, you know, dear, we cannot have everything. Your position is rather unusual: we have no son or nephew to whom to offer the living—hardly even any relative or friend for whom you have a personal liking. Mr Halling was your college chum, and his views and yours agreed perfectly; but after forty years of such a rector we must not expect to find another man like him—it is impossible.'

The baronet's little gust of temper had blown over in a moment, and at his wife's mention of the lack of a son a shade passed over his face. For the Fortesques were childless, and the heir-at-law was a distant cousin—a fact which did not, however, cause the baronet to remit for a day his untiring efforts to keep his estate in the highest possible state of order.

'It's a confoundedly troublesome business. I wish poor Halling could have lasted our day; and why must that boy take up all these ritualistic notions?'

'I really think you exaggerate the ritualism of the service at St Agatha's; ours is very plain, you know, and when old people like ourselves get up to London and into a strange church they are perhaps apt to take alarm needlessly. Frank naturally has to conform to his rector's wishes in matters of detail; but it by no means follows that he would want to introduce all such details into a little country church—especially against the wishes of his oldest friends.'

'I can see you want me to appoint him.'

'My dear John, I want you to do nothing but what you feel clear is for the best. You have settled that Frank is—though, as we both agree, a very nice boy, and in many ways just suited for a country parish—not one whom you can have at Bredon. But don't let the affair worry you. Think it over for a day or two quietly, and I'm sure you will come to a right decision.'

Sir John seemed about to continue the discussion; but Lady Fortesque, gathering a basket of keys and a little pile of books from a side-table, left the room.

Her husband heaved a sigh, and, rising, seated himself in his easy-chair to peruse the London paper which formed part of the contents of the morning post-bag at Bredon Court. It was a paper which had given two generations of Fortesques unfailing satisfaction; but this morning even the unadulterated Conservatism of its leading article failed to soothe Sir John's perturbed spirits, and after a few minutes he tossed it aside, took his hat from a side-table and a stout, spud-shod stick from a corner, and stepped through the French window on to the terrace.

The prospect before his eyes was as desirable a one as could be viewed by any landowner. From the terrace the close-cut turf sloped away beneath a spreading copper-beech and two stately cedars to the half-concealed dividing-line of a sunk fence, where it gave place to the rougher grass of a well-timbered park, bounded in its turn by a circling line of plantations half a mile distant. Beyond this was visible a fertile plain of pasture-land, in which the eye caught the gray stone of ancient ruins and the gleam of the Abbey fish-ponds. Farther still, the view closed in with the hill on which the village of Great Bredon straggled irregularly past the church to the summit, where a conspicuous stone column testified to the virtues of a former Fortesque.

There had been rain in the night, and every foot of the smooth sward sparkled with a thousand crystal drops. Blackbirds and starlings were busy in pursuit of the early worm, while on the topmost branch of the copper-beech a thrush carolled forth its song of gratitude. Sir John was grateful too, for he well knew the value of a shower after a week of hot May sunshine; he could see the wheat springing in the eighty-acre field of the Home Farm, the grass coming thick and fast for his flock of blackfaced sheep. But between him and these pleasant sights and sounds of the spring morning hovered the shadow, ever drawing nearer and nearer, of this unwelcome demand of duty—the duty of finding an occupant for the snug rectory from which his friend of half-a-century had slipped so swiftly away. A year ago the task, could he have foreseen it, would have seemed easy enough; for who had so good a claim upon him as Frank Maddison—Frank, the son of another college friend who had been second only to Halling in his esteem; Frank, who had stayed times without number at the Court, played such a capital hand at whist, took so kindly to the farmers and workpeople, was such a judge of a horse, and had even very tolerable notions on farming generally—better, certainly, than poor Halling, who was a sad book-worm, and scarcely knew a cow from a gooseberry-bush! Who so suitable as Frank—till a year ago? A year ago! Why had he, Sir John, gone to London last spring? He hated London, with its functions and fallals, its dusty tan instead of green turf for a morning gallop, and its rascally livery-stable keepers. And then his wife must needs drag him down to the West End church where Frank was curate, and at which he was to preach that morning. Sir John dug his spud into the ground with an impatient gesture as he recalled church and sermon: the one full of overdressed women and kid-gloved men, the other of allusions to science, poetry, and what-not; not good, solid quotations in Latin—those he could have understood—but modern claptrap to tickle people's ears. And then the service: the interminable procession of choir-men and boys, the measured intoning, the rapid reading of the lessons—he could have read them better himself.

True, his wife had said the boy was young and had much to learn; that he was tactful and anxious to do right, and would soon find the sort of sermon which would appeal to rural listeners. How did he (Sir John) know that? Once in, there would be no turning him out; he might set the whole parish in a blaze with his newfangled notions. No, let young Maddison stay where he was; he should not come to Bredon. Some one else should come; there must be some one. Augusta should settle it; only not Beavan—he drew the line there; nor Lascelles, with his mother—an interfering woman. That was settled; he washed his hands of it. Augusta should choose.

But in spite of this mental ablution he failed to rid himself of the cloud on his face, and the morning's occupations lacked their accustomed savour. Even the improved condition of a swelled tendon in the off fore-leg of his favourite cart-mare did not give unmitigated satisfaction, and his lack of cheerfulness during the inspection left the head-wagoner oppressed with the fear that his master's well-known discernment in such matters had detected some obscure but unfavourable symptom. The two short-horn heifers who, in the seclusion of a loose-box, were in course of preparation for prize-winning, displayed every sign of good health and condition; but here again their owner left a vague air of trouble behind him. 'Sir John did seem to be kind o' absent-like,' their attendant remarked later to the bailiff; and forthwith that functionary worried himself throughout the day to discover the cause.

Lady Fortesque, on the other hand, went about her household routine with a countenance placid and untroubled. She interviewed the housekeeper and the cook, gave audience to the head-gardener on the subject of 'bedding-out,' combed her old Aberdeen terrier, and then, seated at her escritoire, occupied the half-hour before luncheon with tearing up an accumulation of letters and papers. And she too had her unspoken soliloquy.

'Poor, dear John!' and the soft, brown eyes took a still tenderer look; 'he is sadly worried over the business. But I think he is nearing the end of it now. I brought him face to face with the alternatives this morning—and such alternatives, too. The Bishop—John can't bear him; Lascelles—Beavan—and poor Percy Wilmot! What a

selection; and what a thing it is to be a fool! I suppose, now, if my case were Louisa Wilmot's, her only notion of gaining the point would be to keep up a perpetual teasing, interspersed with floods of tears when the teasing didn't seem a success. Well, poor thing! I dare say her mother was foolish before her—never told her, as mine did, that the best of men need a little humouring and management at times—a little diplom—— Yes, Cooper, what is it?'

'Miss Deane, my lady.'

'Ah, Dorothy, my dear, has this lovely morning brought you out?'

The visitor was a very pretty, fair-haired girl of nineteen or twenty, who greeted Lady Fortesque with an affection bespeaking an intimacy free to dispense with the calling-hours of strict etiquette. But after the first exclamations were over, it did not appear that Miss Deane's visit was the result of any particular urgency, for she devoted herself to the terrier, and allowed her side of the conversation to languish.

'How is your aunt, my dear?' Lady Fortesque asked presently.

'Very well—at least—no, not very well, I think, this morning. Shall you be coming to see her to-day, Lady Fortesque?'

'I had not thought of doing so. But does Miss Manners want to see me? If so, I will certainly come.'

'No, I don't know—at least—I thought perhaps you were coming,' was the not very coherent reply.

Lady Fortesque looked at her young friend attentively; but Dorothy was examining the terrier's coat with an attention which did not permit her eyes to meet those of the elder lady.

'She's had a letter from Fr——, from Mr Maddison—at least I think so; and I thought you might—might—say something, Lady Fortesque.'

'Oh-h-h-h! a letter from Mr Maddison. I *see*. And are you in any way concerned in the correspondence, little girl?'

Dorothy's fair head sank still lower over the dog, but a glance at her burning cheeks answered Lady Fortesque's question.

'I see,' she repeated.

'Oh, dear Lady Fortesque! he wants me to be engaged to him; and you know how tiresome auntie is about things sometimes. It's not unkind to say so to you, is it? Of course we shouldn't be married yet. He has to get a living, and I wouldn't even like to be engaged without auntie's consent. And she thinks he's *low*.'

'*Low!*' repeated Lady Fortesque, with great amazement in her voice. 'Frank Maddison *low!*'

'Yes. Oh! not that,' exclaimed the girl, in a conflict between tears and laughter, 'but Low *Church*, you know. She doesn't think he pays enough attention to fasts and vigils and—and things. And when he was here in November she was talking about daily services, and he said—but very respectfully, you know, Lady Fortesque—that he didn't think they were quite necessary or suitable for a village, when auntie complained of Mr Halling's not having them; and since then auntie has not spoken of him, or only in a cold, severe way.'

Here the tears had quite conquered the laughter, and Dorothy's handkerchief came into use. Lady Fortesque laid her hand on the girl's arm.

'My dear, a girl who wishes her aunt's consent to her engagement will have, I hope, no great cause for tears. I will drive across and have a cup of tea with your aunt this afternoon, and see what can be done.'

'Oh, Lady Fortesque! if you only *would;* but you won't say that I'——

Lady Fortesque laughed merrily.

'Have no fears for my discretion, dear. A very clever man once called my mother a born diplomatist, and I am supposed to take after her. But dry your eyes, for I see Sir John coming across the park.'

(*To be continued.*)

A JOURNEY WITH SIR WALTER SCOTT IN 1815.

By A. Francis Steuart.

THREE years ago there died in Edinburgh a charming old lady,* ninety-six years of age, who had known Sir Walter Scott well. Lively to the last, hearty and conversational, she was a curious link with the past. She had been married to Scott's friend and nearest neighbour, who planted his trees, with those at Abbotsford, according to the positions of the French and English lines at Waterloo. It was interesting to hear her talk of Sir Walter's gentle kindness when he drove over to her husband's house the day after her marriage, limped into the room, claimed the privilege of twice kissing the young bride, and then insisted on driving her and her husband in his carriage in hot haste to dine with his family at Abbotsford, where, until Scott's death in 1832, she spent much of her time.

Among this old lady's papers rested a thin diary, now imperfect and slightly worn, but not without interest, as it is the journal of her brother-in-

* Margaret Steuart, born 4th January 1806, married, 6th March 1828, Thomas Bruce of Langlee, Depute-Clerk of Session; died 22nd January 1902, in her ninety-seventh year.

law, Robert Bruce, advocate (afterwards Sheriff of Argyll, who died 29th June 1851), who with John Scott of Gala, and Alexander Pringle, younger of Whytbank, had the good fortune to go with Sir Walter Scott on the tour to the field of Waterloo in 1815, which Scott described in *Paul's Letters to his Kinsfolk*, and which was the inspiration of his poem 'Waterloo.'

Walter Scott was considerably older than his three friends. Born in 1771, he was in 1815 forty-four; Bruce was then about thirty; Pringle, called 'Whytbank,' twenty-four; and John Scott, 'Gala,' twenty-five. Such was the party that set out from the Scottish Borders to see the field of Waterloo.

All the travelling companions knew their friend's worth. Walter Scott was by this time a very famous poet, and that he was the Author of *Waverley* and its successors was known to all his Border friends. Gala's journal of the tour, full of what Walter Scott said and did, was afterwards elaborated and published (posthumously) in 1842. *Paul's Letters* tell not exactly what Scott was interested in, but what he knew his public would be interested in. I am not sure, therefore, that Robert Bruce's diary, now before me (though the writer was not to any extent by profession a man of letters), does not give us the best idea of what actually happened during the tour, as it was Bruce's first journey abroad also, and he was naturally as much interested in his own observations of foreign parts as in those of his greater companion.

Robert Bruce's journal commences: 'We left Edinburgh on Friday the 28th July, at 5 in the morning, in the Wellington Coach, and got to Newcastle that night. Thence we proceeded to York in another coach on Saturday the 29th. On the morning of Sunday we went to the Minster to hear the Cathedral service, which is there performed in great perfection, and to see the building, which is certainly remarkably fine, though I was hardly so much pleased with it as I expected after all I had heard. The stone of which it was originally built seems in many places to be going fast to decay; and though they are busy repairing it, apparently with great judgement and taste, yet the junction of new and old building in one edifice seems always to produce a bad effect.' From York the party proceeded to Hull, and on the 31st crossed the Humber, 'for which the tide was not favourable till 11 o'clock,' and when safely across they found 'the Mail for Lincoln did not go off from the other side till 3.' However, they were through this rewarded by a sight of the Cathedral at Lincoln by moonlight. 'This Cathedral is particularly fine, apparently much more so than York, though it seems to be less talked off or known—at least in Scotland.' On 1st August they left Lincoln and arrived at the next town, Peterborough, where the writer thought the Cathedral 'a very Noble Building,' and then proceeded to Cambridge, which University had been the *alma mater* of Gala and Whytbank.

At Cambridge, in order to see 'the sights,' they 'got up at 7 and went to the Chapel of St John's College, which is a very noble piece of architecture, and, as Walter Scott said, the most perfect specimen of Fine Gothic which he had ever seen;' and then, with a glance *en route* at 'the ruins of a very old, extensive, and curious Abbey' at Bury St Edmunds, they went (in a couple of post-chaises from Ipswich) to Harwich on the 3rd, to find they had just missed the Continental packet! However, by inquiries, they discovered that 'besides the ordinary packets which went with the mails there were others which might be hired.' They examined one of these, and found it 'extremely neat, being quite new and never having been a voyage, we hired [it] to carry us over for twenty guineas,' and they sailed on the 4th for Holland; and all being miserable—'Walter Scott said he suffered more than he had ever done before'—they were thankful to land at Helvoetsluys on the 5th. There their linguistic troubles began, for the writer 'was shaved by a Dutch Barber who could neither speak a word of French or English, so it was all Dumb Show between us.' They went in a 'skuyt or open boat' up the Maas to Williamstadt, and there got a '*voiture* . . . this large old-fashioned carriage which contained three rows of seats and was drawn by three horses yoked abreast of each other,' and proceeded along the roads made on the tops of the dykes, much impressed with the peaceful look of the Low Countries; 'indeed, there is an appearance of quietness, soberness, or what the Scotch would call "*Douceness*" about the country, the inhabitants, and the Horses, which I think is very striking.' At Bergen-ap-Zoom they secured a cicerone who 'originally had been a Scotchman,' who took them round the ramparts, explaining the scene of the operations of Generals Skerrett and Cooke on 8th March 1814. According to him, when Skerrett received his mortal wound 'he offered his watch and purse to a French soldier to carry him to the bottom of the Rampart, who took his money, seemed to comply with his request, but as soon as he got to the bottom gave him three mortal stabs with his bayonet.' On the 6th they started in 'a much more roomy' *voiture* for Antwerp, and visited the fortifications and the Cathedral, where, 'though the service of the day was over, we found many Catholics, apparently pious, kneeling before the several Altars.' At this time the Rubens paintings which had been removed by Napoleon to Paris were still unrestored, and the Cathedral denuded of them. The travellers were indefatigable in their sight-seeing, with the result that great fatigue ensued, and this was only dissipated by 'an excellent dinner, with sauterne and burgundy.' On the 7th they proceeded to Mechlin, then went on to Brussels, reaching it after midday, and in the evening attended the Theatre Français, 'which was but poorly attended, the genteel part of the audience still almost wholly military.'

The next day was taken up with seeing St

Gudule, 'the Cannon which had been taken at Waterloo,' and the 'Château de Lacon [Laeken], which was fitted up under the directions of the Empress Josephine, and does great honor to her taste.' The place was full of war memories. 'It was from this Palace that the proclamation which was prepared by Bonaparte, to be issued by him after the battle of Waterloo had he been successful, was dated.' At Brussels the friends separated for the first time. 'On our return, Walter Scott called on the Duchess of Richmond and afterwards went to dine with General [Sir F.] Adam,' leaving his friends to derive consolation from a restaurateur's dinner, white hermitage and claret. On the 9th the party drove to the goal of their ambition—the field of Waterloo. Their minds were eager for every souvenir of the war, and they desired to see and hear everything they could about the battle. 'Walter had fixed with Captain Campbell [General Adam's aide-de-camp] and a Mr [Major Pryse] Gordon to go with us. . . . Captain Campbell, who was in the action, described it minutely, and showed us where the different lines were placed.' They saw 'John d'Acosta [Jean de Coster], the peasant who acted as guide to Bonaparte during the whole of the 18th, and had a good deal of conversation with him.' 'This day,' Bruce naïvely writes, 'was extremely interesting,' and he marvels at the peace and quietness of the place, which he saw little more than one month after it had been the scene of 'the great and bloody conflict' which decided the fate of Europe.

Next day 'Walter,' who was apparently the manager of the whole tour, hired a carriage 'for the whole way to Paris for six louis, so that we posted in it the whole way,' resting at Mons, where 'Walter' presented a letter to the Governor; and next day they went on by Valenciennes, which, though 'still wholly occupied by French troops, travellers were allowed to pass through' to Cambrai.

On the 12th they stopped at Roye, hearing many tales about the behaviour of the different allied troops; and leaving it, arrived at Chantilly, then occupied by the Prussian Guard, 'but the inhabitants are not very fond of them.'

Paris was reached on the 14th, and before St Denis was sighted the travellers had seen two English regiments, which, with the other foreign troops, forced them to look upon France as a conquered country. At the Hôtel de Bourbon they met 'George Forbes, Sir William's brother'—it must be remembered that Sir William married Miss Stuart, Sir Walter Scott's 'first love'—who took them out, and then they enjoyed the pleasures of Verreys, the Opera Comique, and the 'Milles Colonnes.'

Bruce writes on the 15th: 'Sir John Malcolm called while we were at breakfast, and Walter went with him to the Duke of Wellington,' which allowed the rest to see the Procession de l'Assomption at Notre Dame, and to walk to where they could see 'the fires of the English camp.'

The opera, the hearing of a criminal trial, the École de Médecine, the 'Hall of the Marshals' in the Tuileries, and like pleasures took up the next two days.

On the 18th they went to see the Luxembourg, where they found the Prussian troops (who 'had behaved tolerably well') encamped, and on this day they 'had the good fortune for the first time to see the Duke [of Wellington] himself.' From this time the diary slightly loses in interest for us, as the future Sir Walter, we can see, was too much in request in society (for Lords Cathcart, Aberdeen, and Castlereagh introduced him there, as Lockhart shows in his 'Life') to be much with his own party, though he did not forget them, and they continued, with other Scotch friends, to have a merry time. They saw Talma and Mademoiselle Georges in *Britannicus;* and Bruce, though pleased with the former, preferred the British Kemble. On the 20th he rode out to the English camp and to St Cloud. Next day he went to the Jardin des Plantes and the Gobelins, *inter alia*, and notes: 'We dined with Walter Scott at the "Cordon Bleu" in the Boulevard de Temple,' coming 'quietly home in the evening.' On the 21st, visiting the Louvre paintings (which still included Napoleon's plunder), and the delight of seeing Mademoiselle Mars, were the chief occupations; 'some loyal allusions to the present situation of the King' (Louis XVIII. *le Désiré*, or, as his enemies called him, *l'Inévitable*) in the theatre 'were rapturously applauded.' On the 23rd they went to see the King of Prussia review his cavalry, and then rode round Paris, but could not see the castle, which, though it had declared for the king and so remained French, had not surrendered to the allies.

The short diary ends at this place, for John Scott of Gala's journal shows in a note, 'Our friends Mr Pringle and Mr Bruce left Paris about this time on a tour to Switzerland.' Unfortunately Bruce's Swiss journals are not known now to exist. Gala himself left Paris with Sir Walter Scott on 9th September, on their homeward journey.

DEATH IN THE DESERT.

By A. C. Simkins.

TO the average person the desert has no charm and no interest, and surprise is felt that anything can be written of it worth recording. Every one knows it has dangers, and that those who traverse it meet with hardships, and in many instances lose their lives; but unless he has dwelt in it he cannot understand that, sun-scorched and awe-inspiring as it appears, the desert has so great an attraction for many that they would refuse to live elsewhere. The Bedouin, at home in some oasis of the Sahara, would not change his surroundings if he could; and the North American Indian on what is known as the Great American Desert, the subject of this article, might readily move to the green, rolling prairies or to the still greener foothills of the Rocky Mountain range did he care to do so; but he does not, and ever remains the most contented in appearance of all those wild tribes now vanishing before the white man.

Year by year great stretches of desert land are being reclaimed by the sinking of deep wells and the installation of powerful pumping-plants as well as irrigation works, and prosperous communities now thrive where in times past no man remained except he had abandoned all hope to look for the coming of the vulture and the buzzard. Yet in spite of all that is being done, and rapidly as the work progresses, there will be deserts for centuries, and lives will be lost as well as gained. 'Lives gained?' may be the surprised expression of those unfamiliar with the life of the desert. Yes, many are the lives saved annually by a residence there. Indeed, for one now lost there are hundreds saved. For pulmonary troubles no climate compares in beneficial results with that of the desert. The dry air, the wonderful profusion of sunlight, the freedom from sudden atmospheric changes, work wonders, and lives apparently hanging by a thread seem after even a short residence to hold on with a grasp so strong as to say to the world the white man's scourge has been conquered there. And so it is that the desert has something to be said in its favour, while it has undoubtedly much of interest too for those who have a fondness for wandering from the main highways. Settlements on it are necessarily few and far between, and the extent of each is confined to the number which can be supported by the wells dug frequently to a considerable depth, or to the reservoirs built at convenient places to hold the waters which would otherwise go to waste during the rainy season. The industries on what may be properly termed the Great American Desert are numerous, and many of them are exceedingly prosperous. The extensive borax-deposits of Death Valley (a valley well named, for the number of its victims is legion) supply the market with a large proportion of this useful product, and the mountain-ranges which dot the desert here and there produce millions of pounds' worth of gold, silver, and copper annually. Each year sees some new discovery, some poor man suddenly made rich, and towns added to the map. Every one of these towns soon becomes as safe as, and, from a health standpoint, more desirable than, even old established cities, and one is prone to forget the lives which have been lost in discovering the mines before deep wells and modern pumping appliances made the place habitable.

From these towns the tireless prospector now starts for fresh fields to conquer, perhaps to win in the rugged race for wealth, perhaps to die in the attempt, leaving his bleached bones to remind another of his kind of the desperate chances the search for gold too often implies. Rarely a prospector writes of his experiences for publication. He is not of the writing sort; but strange subjects make strange writers, and the story of a single trip may give to others an idea of what desert-life is.

Away from the last vestige of civilisation, and that but an Indian trading-station consisting of a general store, a white man and his family, surrounded by an Indian settlement of some two hundred souls. Seventy miles away from even that, on the desert which lies along the border-line of Mexico and the territory of Arizona, two prospectors were starting homeward bound. The thermometer registered one hundred and fourteen degrees Fahrenheit, and there was a drought in the land. It was San Juan's Day, the 24th of June, when there on the desert the Indians expect to see a gathering of the clouds and the life-giving waters come. Yes, it was San Juan's Day, and the Indians, Catholics as they nearly all are along the frontier, knew when they saw a cloudless sky, in spite of all their prayers, that a drought was upon them. And there were other things equally ominous to those who live so near the soil. The leaves of the ironwood-tree were curling up, and the ants were raising no protecting walls round the entrance to their underground dwellings. It was time to go. From all over the desert the Indians were gathering their ponies and long-horned cattle for a flitting, which ere it ended would see their little herds decimated and themselves face to face with a summons for happy hunting-grounds in spirit-land. No rain, no clouds, and it was San Juan's Day! The prospectors' reservoir—*chaca* is the name used on that desert—had but one more day's supply of water for men and beasts. It was certainly time to go. Taking as much water as they could carry, they started. There were twenty miles to be covered before the first stopping-place was reached. When they arrived they found no water there. A day had nearly gone, for twenty miles on the desert at that time of the year with pack-animals was a

day's travel. To the next was seventeen miles. A few hours' rest for men and beasts, and they were off again. The full moon and the stars gave ample light, and with a drop of several degrees in the thermometer, the second stage, made with as little delay as possible, was wisely undertaken. But here also there was no water, and the supply taken at the commencement was exhausted. The soft, trampled mud in the *chaca*, marked with the tracks of horses and cattle, told the prospectors that a band of Indians with their stock had passed but recently and consumed the last drop of water in this second *chaca*. The exhausted animals, with their packs taken off, pawed the mud and whined pitifully. Too dry to eat the blades of *gramma* grass around them, they stood, after vainly licking the soft earth, dumb and helpless. To carry a load farther was out of the question, and the packs were abandoned. Another rest until the cool of the evening, and the third stage of fifteen miles was begun. The pace now was necessarily slow, the animals needed urging, while the men themselves were suffering from the fierce sun above and the burning ground underfoot. That ground was too hot to recline on, and there was no shade. Sand, cactus, and stunted greasewood, far as the eye could reach—that is the desert there. On they plodded.

Little clouds of dust moving northward from ten to fifteen miles away told them that the scattered bands of Indians were driving their cattle before them out of the country. At noon the third *chaca* was reached. Heaven help them! it too was dry, drained of its last drop. Like the previous one, it had held water until a few hours before. But there was none left, and there had not been enough for all the animals which had been driven to it, for some fifteen or sixteen cows and calves lay there in the fast-drying mud, unable to get up, unable, too, to utter a sound, painfully dying. High above, circling in the clear, blue sky, the buzzards were keeping watch. The moment death came they would be there, gruesome, repulsive scavengers. The prospectors grimly looked at each other. They had made a determined effort to reach this *chaca*, hardly speaking a word during the last stage, for talking wasted strength, and that they had carefully husbanded. Both were typical men of their class, the elder a man of about fifty-eight, wiry, and of medium height; the younger, a man of thirty, tall and athletic, and wiry too, for men of the desert do not take on flesh. As if moved by a common impulse, they walked into the mud, and each turned over a large stone and sat on it. The underside was cool, and enabled them to sit and relax in something like comfort for the first time that day since the sun had been high. That neither yet had given up hope was evident. There was no sign of surrender, though each face was badly swollen and the eyes bloodshot. The elder man looked at his companion and then in the direction of the goal they were striving for. 'Eighteen miles yet,' he soliloquised. 'Can we do it?' 'We will try,' his companion replied. 'But, first,' he continued, pointing to the foothills to the west, 'there 's water up there. Hard climb and very little of it; but it is always there in a *tinaja*.' 'Sure?' queried the other timorously. 'I 'll stake my life on it,' came the ready response. And they trudged a mile to these foothills, and then climbed up for a thousand feet to where they hoped to find it. It had been a hard climb. Footsore, feverish, and all but done, they staggered into a recess beneath the overhanging rock. With eyes straining, and eagerness stamped in pose and expression, they peered ahead. 'Thank God!' spontaneously from two throats broke the silence, and the men went down on hands and knees and sipped the veritable water of life.

Their thirst gradually allayed, for they were cautious in drinking after so long an abstinence, they looked over the valley. Far as the eye could reach it was the same expanse of sand and cactus, barely relieved by an occasional short range of mountains. It was in one of these little ranges now nearly twenty miles away—for they had come out of their course for water—that the Indian trading-post was situated, and the outline of the settlement could be seen through the clear desert atmosphere even at that distance. Converging towards it from every quarter were the little clouds of dust made by the Indian bands of cattle. And still farther away the prospectors saw the dust made by parties which would never reach it, for had they themselves not been over the route to be taken, and just barely escaped with their lives? As they looked over the broad expanse before them, involuntarily they shook their heads, and marked the soaring buzzards, keen-eyed and graceful, on the wing scouting for their prey. The Indians, of course, knew of the *tinaja*, and would make for it as soon as they abandoned their cattle, which they must at the last *chaca*. The *tinaja* was a pool, holding perhaps three gallons, in the solid granite rock. From above the water dripped drop by drop, each drop so far apart that evaporation offset a great portion of the supply. It had saved two lives that day, and ere another sun went down on that long valley it would save several more.

By the time the shadow had stretched clear across the desert sleep claimed the wanderers. Sleep, nature's sweet restorative, put fresh life into them, and on the morrow at the break of day, with a canteen full of water, they started on the final stage of their journey. It was the last, but not least eventful. Four miles from the *tinaja* they came upon a band of Papago Indians breaking camp. Their ponies and the jaded remnant of their band of cattle seemed too weak to complete the journey. Nevertheless, the Indians drove them along with that stoical patience that so often sets the white man wondering. No word of complaint, not a murmur, came from these desert men of an inferior race trudging beside the prospectors, with whom they had, after very few words, joined company. Two leagues were put behind them in the space of perhaps four hours, and the cattle were still all able to make head-

way; a trifle more than three leagues yet remained. The rate of progress was necessarily slow, and several furtive glances had been passed between them to see if any one of their number threatened to fall by the wayside.

A stout heart is a gift of the gods—perhaps the most precious that can be bestowed. It was saving life now just as it has saved many a one before at other times and in other places. In circumstances such as these companionship means much. The example of others bravely facing the same risks reinforces the will-power, and aids materially in overcoming hardships. No one can imagine how it feels, unless he has been there, to face just such dangers as these alone, what it means to be near death on the desert, so still, so merciless. How near they were to death was brought prominently before them now. There on the sand, with face upturned to the blazing sun, was a prospector stark and stiff. An Indian moved his arm, looked him over carefully, and remarked, 'Dead one hour.' He was probably right—Indians generally are in cases of this kind. Nothing could be done for him, burial was impossible, and so he was left, a derelict on that tideless sea of sand. Presently one of the Indians picked up the trail of another man travelling ahead alone. It had come from the dead prospector, and the surmise was that it was the track of his companion pushing on. And now the cattle began to lie down. It was no good trying to get them up. To beat, to urge, took strength, and there was none to spare. In a short space of time the last of the animals had lain down never to get up again. And there were yet five miles to travel! The landmark was a blue limestone mountain covered with Indian graves. It had been one of their burying-grounds for hundreds of years. Beneath it, sitting on an upturned boulder, was a man, his head resting on his arms, which were folded across his knees. At the approach of the little party he arose and became one of them. He was asked no questions; none were needed. They all knew he was the survivor of the two, one of whom had fallen some miles back. The hours that it took to pass over the last five miles, the pain and suffering of it all—white man succouring Indian, and in turn Indian helping white man—need not be told here. The entire party saved their lives by a narrow margin. To the resident Indians on that little oasis they told of the complete drying up of the *chacas* over the route they had come, and as soon as packs could be adjusted the men of the tribe were taking out water to the little clouds of dust which told of other slowly advancing men in need of assistance.

Such is one phase of desert life. The other may be seen in sanatoriums in the settlements where the development of water has made bright garden spots of the sandy waste. There the invalids, brought often when many would avow it was too late for mortal help to avail, can be counted by the score, winning their way back to health and strength. And the desert, sun-scorched and awe-inspiring as it is, demonstrates once more that every single thing, little as we sometimes realise it, has its place in the economy of nature.

THE FESTIVAL OF THE DEAD.

THE STORY OF THE FESTIVAL OF THE DEAD.—'I asked to-day why the sea was so full of stars last night. I had never noticed it until these July days. And then I was told the story of the Festival of the Dead, which is kept religiously in the provinces still. . . . When summer broods over the land, they who have laid by the tasks of earth come back in shadowy myriads to visit their old homes, to hover round those who still love and remember them. Just for those three days of July—the 13th, 14th, and 15th—heart-broken mothers feel the little lost son or daughter close at hand. The dead come back, and take, unseen, their old places in their old homes. They find the house garnished for their coming; the holy lotus-flower, never used save for their honour, is gathered and set by their shrine. Always do they come from the sea; and when the three days are ended and the travellers must go back reluctantly to their shadow-homes, lighted torches are stuck in the sands to guide them, and tiny straw ships of lovely designs are launched, freighted with dainty foods and lighted by small lanterns. And then they go—their little cargoes of love-gifts visible and their spirit-travellers invisible.'—*Extract from 'A Diplomatist's Wife in Japan,' by Mrs Hugh Fraser*, vol. ii. p. 310.

A HOST of stars is in the skies—
The glorious Eastern skies;
And, mirrored in the sapphire sea
That far beneath them lies,
They shine, a path of dazzling light
Which unseen feet will cross to-night.

The night of stars! the night of stars!
The silent souls they see,
Who from the unknown land come back
To fountain, flower, and tree,
The dear old haunts, the simple things
To which their yearning memory clings.

The little child has entered in,
The mother feels him near;
He is not lost! he is not lost!
He tarries with her here,
These summer days and nights of dreams;
Closer than earthly child he seems.

Myriads of souls: they come! they come!
To find that none forget;
The love-gifts wait, the garnished house,
And by each death-shrine set
The flower whose gathered bloom is shed
Only for spirits of the dead.

Alas! while still in mortal robe,
That holy lotus-flower
They gathered for their own beloved,
And for such mystic hour
Whose secret now they know so well,
But unto none on earth may tell.

Perhaps they wonder why we grieve,
So swiftly all things pass;
Our fears and hopes may seem to them
As shadows on the grass
Which flicker at the wind's light will;
But, oh! they love the old home still,

And leave it as we leave the land
Round which our heart-strings wind;
Unseen they crowd the torch-lit sands,
Their freighted ships they find.
Launched 'neath the stars o'er ocean wide,
What hand shall steer, what compass guide?

Silently, as the tide flows back
From the warm, living shore,
So melts the spirit-band away,
Their shadow felt no more.
Yet, sweet, wild legend of the Past,
Is not that shadow ever cast?

SIXTH SERIES.

DEER-FORESTS ECONOMICALLY CONSIDERED.

IT is not easy for any one intimately connected with the system of sport at present pursued in the Highlands to understand the agitation in certain quarters which has arisen against it. It is perfectly obvious, however, that this agitation arises amongst people at a distance from the scene of the sporting industry—people who understand nothing whatever of the conditions under which it is carried on or of the localities devoted to it. They assume, for the purposes of their own argument, that the deer-forests occupy a fertile tract which capital and labour would convert into one shining and smiling field of golden grain. They carefully stop their ears when one attempts to tell them that this region never has been and never will be one in which an agricultural industry can succeed. When to a barren soil and a rigorous climate comes to be added the unprofitable return for any possible production of the land, a reasonable man will see that agriculture, which at present is bearing such trials in the most favoured localities, has become utterly impossible to the Highland wilds.

No true sportsman would ever go to the Highlands of Scotland if he thought the indulgence in his taste took bread from the mouth of a single individual. For thirty years a gentleman has taken a grouse-moor or deer-forest, and in discussing this very matter, affirms that not for all he possesses would he allow his sport to interfere with a man's means of livelihood. Years ago, Mr Winans, an American, spent no less than three hundred pounds per month on labour alone. Deerstalkers are in receipt of regular wages, varying from eighteen shillings to thirty-five shillings per week. A more active, intelligent, and capable body of men it would be difficult to meet; and although the land were offered to them for cultivation, they would refuse to change their present condition. From this class, mainly, the Lovat Scouts were chosen in the late Boer war.

Since 1884, the date of the issuing of Lord Napier's report, a great extent of land has been added to deer-forests. In the ten years immediately following the report five hundred and ninety-one thousand acres had been added. In Lord Napier's report of 1884 it is stated (p. 93): 'We have considered it our duty to record unequivocally the opinion that the dedication of large areas exclusively to the purposes of sport, as at present practised in the Highlands, does not involve diminution of food-supply to the nation; and we have amply recognised the various benefits which are in many cases associated with the sporting system where it is exercised in a liberal and judicious spirit.' In an investigation before the House of Commons, Mr Mundella admitted that, supposing all the land now devoted to deer had gone back to sheep, the difference in the price of mutton would not be one penny per pound.

Lately, a respected Edinburgh divine, who is, first of all, a good Highlander, referred to the insufficiency of the necessaries of life in the Highlands. The concluding seven years of the seventeenth century were years of great dearth over the greater part of Scotland, and the Highlands then suffered very severely. It was stated by Fletcher of Saltoun that in 1698, in addition to those very meanly provided for 'by the church boxes,' there were in Scotland two hundred thousand people begging from door to door. The year 1740 was another year of scarcity of food, when a great frost, with 'deep and untimely' snow, occurred in spring. The bad and late harvest of 1782 led to another season of severe and alarming famine. Then the strong tide of emigration began to flow to America. In 1807, 1817, 1836–37, and 1847–48 there was much destitution and want—bleeding of lean cattle for human sustenance, and actual starvation of men and cattle.

The 'removals' or 'clearances' in the Highlands at these periods were in the main an unavoidable outcome of inexorable economic laws operating upon the depressed and hopeless condition of the smaller agriculturists in the Highlands rather than the effects of purely arbitrary landlord power. Remarkable success, for a time, followed sheep-farming. The large sheep-farmer introduced, and depended

[*All Rights Reserved.*]

largely for success upon, improved breeds of sheep, and gave his utmost attention to other methods of increment of both carcass and fleece. The importation of wool ten years ago was fully six hundred and seventy-one million pounds. Is it any wonder sheep-farmers have manifested, and are still manifesting, a decided desire to escape from the business? The most desirable sheep-farms of a quarter of a century ago are now neglected, or can only be let on terms very much reduced. Herein lies one of the chief reasons for the formation of additional deer-forests. The deer-forests contain little arable ground and much less low-lying pasture-land than sheep-farms.

Of one hundred and thirty deer-forests appearing in the parliamentary return of 1891, no fewer than one hundred and twenty-six reach an altitude of over one thousand feet, one hundred and six exceed two thousand feet, sixty-one exceed three thousand feet, and seven exceed four thousand feet; the highest being four thousand two hundred and forty-eight feet. Only thirty-one descend to the level of the sea. In Argyllshire there are nine forests which touch sea-level, five of the nine being islands. In this county a very large preponderance of the land afforested is over five hundred feet above sea-level. In Inverness-shire there are upwards of forty-five deer-forests; the height of the land varies from one thousand three hundred and eighty-six feet to four thousand two hundred and forty-eight feet; and here the most sterile and valueless land from an agricultural point of view is found. Twenty-six of these deer-forests, or 60 per cent., attain an altitude of three thousand feet, and no fewer than thirty-nine, or 90 per cent., exceed two thousand feet. Ten of the Inverness-shire forests touch the sea. Of these, five are insular and five have a seaboard of the most rocky and absolutely unimprovable character. Ross and Cromarty has forty-six deer-forests. In this county nine touch the sea. Sutherlandshire has eight deer-forests. The extent of arable land in, say, one hundred and ten deer-forests is less than three thousand acres.

Then, the rental is from sevenpence halfpenny per acre in Sutherlandshire to one shilling and sixpence three-farthings in Caithness-shire. While the average rent per acre for the whole of Argyll is four shillings and a penny three-farthings, the land afforested is only worth eightpence per acre. For Inverness-shire the average rent per acre is two shillings and fourpence, and the deer-forest rent per acre tenpence halfpenny. For Ross and Cromarty the average rent per acre is two shillings and ninepence three-farthings, and the deer-forest rent per acre elevenpence halfpenny. While the average rent per acre of the counties of Argyll, Inverness, Ross, Sutherland, and Caithness considered together is three shillings and threepence farthing, that of the deer-forest area in the same counties is only elevenpence farthing. But there are deer-forests in Aberdeen, Banff, Bute, Forfar, and Perth to which we make no reference. Generally, however, only the poorest land is devoted to deer in any of these counties.

The red-deer is a hardy animal, and is perhaps better able to endure the privations of hunger or inclemency of weather than the hardiest breeds of sheep; but though during the milder portion of the year he seeks the highest mountain retreats, he is compelled, in common with every four-footed animal in the British Isles, to betake himself during winter to the lower expanses, where alone shelter and herbage can be obtained. So that it is indisputable that withdrawal of the arable land from deer-forests—very limited as it is—and withdrawal of the lower pasture-ground, say, under five hundred feet level, would be fatal to these institutions.

The great sheep-farming industry has, it will not be disputed, exercised an enormous influence in the marvellous development of the Highlands. But sheep-farming, from inflexible economic causes, has been for some time, and is at present, greatly depressed. One has only to contrast the wool-markets of Inverness and Oban of to-day with those of twenty years ago to see that no further proof is required for the statement. But so important and indispensable to the welfare of the Highlands does this great interest remain, even in its present less flourishing condition, that the evils which would result from its permanent downfall need no demonstration.

Deer-forests have been described, sometimes in ignorance and sometimes in malice, as the fruit of the riches and luxurious idleness of the present day, and the outcome of gilded temptations offered by a Southern and American plutocracy to a financially feeble Highland proprietary. Deer-forests are not a growth of yesterday. The poems of Ossian are full of allusions to the chase. There is a story told in the song of a nurse to one of the chiefs of Chisholm, who was for some cause or another condemned to banishment to the Laigh of Moray, and was granted any request she might like to make before leaving. Her request was to have a house erected on the scene of her banishment, in which she might live, the house to be made of timber from Strathglass. The request was complied with, but she had not been long there when she bewailed her sad lot in words to the effect that, although living in this house of Strathglass wood, and beside a field of waving barley larger than the people of Strathglass ever dreamt of, she could never be happy till she returned to the sight of the dun deer and the brown in the woods of Comar. The Highlander is not naturally an agriculturist. He lived on the produce of his bow and spear. The earliest records in the Highlands—the sculptured stones—whilst bearing no traces of a ploughshare or even of a sheep-shears, except as a symbol of women's art, exhibit many scenes from hunting-life. There is ample evidence to show that the Highlander rather despised agriculture. Sir Walter Scott tells the story—printed in the 1876 edition of

Burt's *Letters from the North of Scotland*—of a Highland chief named Donald the Hammerer, who was so enraged at finding his son engaged in farming and directing farm-labourers that he pursued him with his sword. The son took refuge in his house, and crept for safety under a bed. Donald followed, and in the uncertain light, thinking his degenerate son had concealed himself in the bed-clothes, made a deadly stab at his supposed son; but, instead of killing him, his sword went through the heart of his old nurse, who was then nearly eighty years of age. After the unfortunate accident Donald became very religious. With his natural taste for sport, the native Highlander in the hunting districts is only too pleased to find a congenial occupation, and one for which his services are handsomely rewarded. After the pastoral industry fails, after the agricultural industry fails, he goes kindly back to hunting. Besides the wealth which sportsmen have brought into the Highlands, and which has built schools, endowed churches, made roads and bridges, introduced medical aid, improved dwellings, and raised wages, the contact with men of wealth and education from all parts of the world has helped to widen the native's range of thought, and gives him the self-reliance of the man who has measured himself with his superiors, and is not ashamed of the place he takes beside them.

Opponents of deer-forest extension ask, are the Highlands of Scotland to be definitively converted into an uninhabited wilderness? It is not sound economy to hold that the Highlands should, as the best use that can be made of them, be converted into desert habitation for wild animals, in which the wealthy may enjoy fashionable sport. And the opinion of Sheriff Brand's Royal Commission (Highlands and Islands, 1892) is that 'provision should be framed under which the crofting class would be protected against diminution, for the purpose of afforestment, of arable or pasture area now in their possession, and by which the areas which might thereafter form the most appropriate scene for expanding cultivation and small holdings should be preserved from curtailment.' But the fact remains that the young people of the Croft will not remain at home. Thinking and far-seeing men miss the Scottish Highlander. So-called Highland regiments have for some years past been made up in growing proportion of the sweepings of southern towns—feeble specimens of humanity, who can no doubt be greatly improved by attention to diet and regimen, but whom no amount of training can supply either with the great limbs or with the great heart that carried the flags of the Highland regiments through Quatre Bras and Waterloo. But never again shall the Highlands witness the animation of human life the late Queen Victoria's visit to Taymouth, in 1842, called forth. Sir Thomas Dick Lauder's *Memorial of the Royal Progress* tells of Her Majesty's arrival being awaited by a regiment of the Breadalbane Campbells, which was fully one thousand strong. To-day the men are gone, never, we are afraid, to return. The economic conditions are quite changed. The young will not labour on the land. It is to them exhausting drudgery. Off to the towns they go from the remotest Highland clachan, with the result that the very young and the very old remain, perforce, at home. Thinking imperially causes one to cast one's eyes abroad, and Highlanders and their descendants are seen in thousands in Australia, New Zealand, and Canada—the strength and glory of the Empire.

Since the able report of Lord Napier's Commission in 1884 (uninstructed criticism may be said to have held the field before that), a better state of public knowledge and of public opinion has prevailed. The Commissioners in that report stated that 'during the course of their inquiry they had only come upon one clearly established case in evidence of the removal of crofters for the purpose of adding to an already existing deer-forest' (p. 84).

It would not be too much to say that in some localities abolition of deer-forests would dislocate the whole economic arrangements, and be for those localities a transmutation from prosperity to poverty. The whole of the Highlands, indeed, are intimately dependent on gains from visitors. The acquisition of money from shootings and fishings especially is immense, and correspondingly great is its circulation among the trading and labouring classes, to whom, it is needless to say, this is of vital moment. Through the great rents for the lease of sporting subjects, especially deer-forests, the parish rentals are very largely increased, and the pressure of taxation upon the poorer ratepayers is correspondingly alleviated. Over the whole of the sporting areas this is computed to be not less than 25 per cent., while in many Highland parishes the contribution of rates and taxes from sporting possessions is far higher, amounting in some instances to half of the whole rating. In not a few of these parishes rates are abnormally high, unavoidable though it may be, reaching to five, seven, and even ten shillings per pound of rental; and in such districts it is evident that a withdrawal of the sporting rental would be speedily followed by financial collapse. Further, these big rents enable the landlords to devote more of their means to improvement of their estates and to the employment and comfort of their smaller tenantry and employés than they otherwise could possibly do.

But not through rents alone do the Highland people benefit from the sporting system in their midst. Every lessee of a deer-forest or a grouse-moor, or of a salmon-fishing, must, in the mere maintenance of his establishment, be at considerable charges. In some cases these are upon a great scale. But though responsibility for removals of the population cannot be truthfully laid to the charge of deer-forests, the dedication of so much land to purposes of sport has not entirely escaped condemnation, both on economic and sentimental grounds. Here again, however, a due appreciation of the circumstances and the motives which have

induced the owners of these properties to adopt the course of afforesting them will, in nearly every case, compel the candid inquirer to admit that not only was there no other course open to these gentlemen, but that the course adopted has been for the best in the public interest as well as their own. The severe and protracted depression in sheep-farming has in many cases compelled the owners of high wedder-lands either to afforest them or let them lie tenantless, rentless, and useless.

Take a typical case. A large sheep-farm, probably carrying five thousand sheep, falls out of lease. The outgoing tenant has intimated that he does not desire a renewal of the lease, and the farm is consequently advertised to be let. No offers for it are forthcoming—a common experience in these times. In such a case the proprietor, if he ventures to take the farm into his own occupancy, is obliged at the outset to find a capital of ten thousand to twelve thousand pounds wherewith to buy the sheep-stock on the holding. He is very probably obliged to borrow this amount at a high rate of interest, and upon security other than the sheep-stock itself, which no financier will accept as sole security for an advance. He may be in a position precluding him from even this expedient, and at the best he knows there is no probability, under the financial burden thus imposed, and in view of the unprofitableness of sheep-farming, of his carrying on the farm successfully. He is, therefore, pressed into a very tight corner, out of which the only means of escape is through afforestment of the farm. What else could he have done, or ought he to have done, than embrace this mode of relief? He thereby saves and benefits himself, no doubt, and self-preservation is the primary law of nature; but he benefits his neighbours as well. He secures a substantial rent, and thereby not only prevents the increase of local taxation, which would obviously occur were the farm unlet, or let at a largely reduced rent, but he actually contributes to the amelioration of the taxes then existing, besides having brought into the district a new source of employment for the local population. Many deer-forests have originated in circumstances such as have been here described.

The loss of meat by the displacement of stock in all the deer-forests in existence is but the fraction of a fraction of the total consumption of meat by the nation. So also it is with regard to wool. The extent of land afforested is two million five hundred and fifty-two thousand three hundred and eighty-three acres, and it has been officially laid down that five acres of average land devoted to deer-forests are necessary for the maintenance of one sheep (Napier Commission Report, p. 86); therefore the deer-forests are capable of maintaining five hundred and ten thousand four hundred and seventy-seven sheep. But, under the universal system of management of hill-stocks in the Highlands, the number of sheep sent annually to market is only, at the most, one-third of the total stocks, which gives a possible annual output from the deer-forests of one hundred and seventy thousand one hundred and fifty-six sheep; or, reckoning the weight of each sheep at sixty pounds, a total quantity of ten million two hundred and nine thousand three hundred and sixty pounds of mutton. Let this be now compared with the national meat-bill, which is 110·444 pounds per head of the whole population. Contrasted with the supply of mutton which the grazings comprising the whole of the deer-forests would be capable of yielding if restocked with sheep, the proportion is found to be only ·002 pound per head of population.

The increasingly valuable benefits derived from shootings and fishings are at present the only prosperous possession within the Highlands. The loitering march of prosperity of the Celtic Highlands, in so far as it is due to dissimilarity of race or duality of language, is a condition which is gradually, and at an increasing pace, wearing itself out.

The recent circular on Gaelic of the Scottish Education Department, the first by the new Secretary (Dr John Struthers, C.B.), is a futile attempt to galvanise a decaying and dying language into some semblance of growth. Gaelic is admitted as a subject of examination for the Leaving Certificate. No fixed course is laid down. The Celtic societies may be trusted to make the most of this concession to Highland sentiment; but the proof of the whole-heartedness of the cry for Gaelic teaching by Highlanders is yet to come. It can only be found in the numbers of the youth of the Highlands who, by hampering the progress of the programme of a modern education already overcrowded, shall come forward and voluntarily acquire a language which is of no utility whatever in the busy workaday world. The greatest difficulty Highland school boards will now have is to secure competent Gaelic teachers. A new terror is added to the teaching profession, whose burden is already greater than it can bear.

GIANT CIRCUMSTANCE.

CHAPTER XX.—TOUCH-AND-GO.

THE kelpie did not cry that night, or if it did, Geoff did not hear it. He waited expectantly. But the fresh air had made him sleepy, and he went to bed early and slept like a top. The last thing he thought of before he fell asleep, and the first thing he thought of when he woke up, was of those miles of smooth, wind-swept, black ice on the dappled loch among the hills. It called him irresistibly, and he set off immediately after breakfast, with his skates jingling, as merrily as any schoolboy. And Tom Brading, whose metropolitan upbringing had provided no opportunities for learning to skate, was to follow later on with some lunch.

Geoff found excellent sport. His skates were new; the ice was like a mirror, except where the snow had drifted and frozen. He had not had such a good time since he was a boy, when winters were still winters. Company would have been pleasant, of course. But you can't get everything in this world—not all at once and just when you want it, anyway.

There was no sun that day. The sky lowered the colour of lead against the nearer white of the hills. The pines and firs stood in their gloomy phalanxes like a frozen army, and big feathery flakes were beginning to fall in a business-like way. Another day and he would have been too late, he said to himself.

To any onlooker, that solitary figure gliding and skimming over the long desolation of the frozen lake could but serve to emphasise the loneliness of the scene. He seemed to have the whole valley to himself, and to be quite content. Then suddenly he fell in need of company.

He was racing at speed down a lane of black ice, when his right skate ran into a projecting snag of wood that barely showed above the surface. It snapped the spring off its clinch, loosened the skate, twisted his foot, and flung him headlong into a white patch of snow which gave way beneath him, and he was in the deadly-cold water.

Now, ice, like many another body we wot of, is strong while whole, but once broken, its strength is gone. Carrick tried cautiously all round his hole for support, but the treacherous stuff broke under his arms wherever he rested on it. He was a good swimmer, and the hundred yards or so to the shore would ordinarily have been a matter of small account. But to chip a way slowly through a hundred yards of ice, with his limbs already numbing with the cold, was out of the question.

He thought suddenly of the kelpie's warning, and wondered if Mr Duncan Cameron was really going to have the pleasure of chuckling over his unbelief and his dead body. He wondered if Tom Brading was anywhere within reach of a call. But that was not likely. He had not been there more than an hour and a half, and Tom was not to start till twelve. He was getting very cold. Very soon he would get cramp and sink quietly out of sight. He tried desperately to drag himself on to the ice, but it broke always and let him down with a splash. He could rest his chin or his hands on it, but no more. He did not shout, because shouting seemed futile, and by nature he was not given to shouting, no matter how tight the place he was in. And, curiously enough, his silence in his desperate plight stood him in good stead.

Suddenly the sharp bark of a dog fell on his dulling ears, and looking that way, he saw a girl racing down the hillside. She stopped to pick up one of the pine-poles that lay in the slide, and then came hurrying towards him, the dog leaping joyously about her.

She came out on the ice.

'Don't come too close,' he called. 'Keep off the white places.'

She came as close as she dared and shoved the pole at him, but it was still beyond his reach.

'Take it, Colin!' and the dog laid hold of the pole by one end and tugged it across the ice till Geoff could lay hands on it.

'Thank you, old boy!' he said; and the dog stood off, panting, and watched him intelligently.

He laid the pole across the shore-end of his pool and drew himself gingerly up on to the ice. Three times it broke beneath him just when he thought he was safe; but the fourth time, either through extra caution or a stronger streak of ice, he managed to drag himself out, and lay spent, while the collie danced excitedly and barked encouragement.

Presently Geoff wriggled along till he deemed it safe to venture on to his knees, and so came at last to the shore, and saw, what the dog had already told him, that it was the girl with the scornful dark eyes who had come to his rescue.

'I am greatly indebted to you,' he said. 'I think you have saved my life;' and then, as he put his right foot to the ground, his face suddenly twisted with pain and his leg gave under him.

'I feared that was so,' he said with tight lips. 'My skate caught in something and twisted my foot.'

She looked at him unyieldingly for a moment. Then the woman in her trampled down the other things, and she softened towards him.

'What can I do?' she asked.

'I think, perhaps, if you could bring me another pine-pole I could get along.'

She found him a pole, and he essayed progression.

'You can't possibly get home that way,' she said, with a decidedly worried look in the large dark eyes.

'My man was to come about one o'clock. Perhaps I can limp along till I meet him.'

'You would be dead with cold before then.'

'Yes, I am very cold.'

There was no help for it. Her face showed plainly that the proposition was forced from her by dire necessity alone.

'You had better come with me.'

'Thank you. I'll come anywhere that offers me a fire and some whisky. My very bones are cold.'

'Up this slide, then. It's steep. You'll have to crawl.'

He hopped with his pole as far as it would serve, and then took to his hands and knees and crawled slowly up the steep slide after her. And, in spite of the chill of his soaked clothes and the pain of his swelling foot, he still found pleasure in the sight of her neat little brogues and firm, springing tread alongside him. The collie danced round them with gladsome barks, and so they came slowly and painfully to the top of the slide. There she found him another stick, and he limped down the glen, among the pines and firs, till they came upon the cottage on whose door he had thumped the previous day. She took a key from her pocket and unlocked the door, and motioned to him to enter.

Above all things he craved warmth. Here was a red fire on a wide hearth. He saw nothing else at the moment, and went straight to it. The girl threw on several handfuls of pine-cones, and laid on top of them some split pine kindlings with the ribbed bark still on, and the fire roared merrily up the chimney. Then she brought him a glass and a large, square bottle of whisky, and he took a big dose, and began to feel that it might, after all, be not quite impossible to get warm again sometime.

Then the girl looked at him consideringly for a moment, and there was the shadow of a frown on her face as she brought her mind to that which was repugnant to her, but he did not see it. His soaked clothes were steaming in the heat, and the happiness of warmth was tingling through his veins and making his head feel at once light and heavy.

'I will get you some dry things,' she said, and returned presently with an armful of garments which proved to be a Highland suit.

'They were my father's,' she said, and something in her voice made him look up at her quickly.

'And you would very much sooner I did not use them. I think these would dry all right.'

'It does not matter,' she said quietly. 'I am sorry there are no others; but you will get rheumatism if you sit in those. I will give you a towel, and you had better change quickly.'

He got himself into a glow with the towel, and then, with much consideration and many doubts, under the close, laughing observation of the collie, got himself into the strange habiliments, and was sitting over the fire with the dog when the girl came back. And there was almost a twinkle in her eyes as she noted some of the details of his costuming.

He stood up when she came in, but had to support himself by the back of a chair, and she noticed that he had bound his handkerchief tightly round his right foot and had made no attempt to put on shoe or stocking.

'Please sit,' she said. 'Is your foot much hurt?'

'It's badly sprained, I'm afraid; but I have tied it up as well as I could. I am quite ashamed to put you to all this trouble, Miss Leslie, and I assure you I am very grateful.'

'It could not be helped,' she said quickly. 'How do you come to know my name?'

'I asked old Donald Cameron that morning when I met you near the glen. May I be permitted to inquire after your mother? I got an impression that she was an invalid, though I really don't remember that he said so in so many words.'

'Yes, my mother is still not well. She is not here just now.'

'Well, I am very grateful to you for making so long a stay in the island. I might have fared badly but for you this morning. And do you live here all alone?'

'I am alone just now, but I do not feel it lonely. I have my dog, and he is good company.'

'He is a fine fellow. I am very fond of dogs.'

She got up and began putting on a thick, long cloak.

'You are surely not going out in that snow?' he asked, looking at the flakes whirling past the window.

'I am going to tell them where you are.'

'Oh, but you must not. As soon as my things are dry I will get along myself some way or other.'

'You won't walk with that foot for ten days. They might carry you, perhaps, but it is a very rough road and difficult when the snow is on it.'

'The more reason why you should not attempt it on my account. I have troubled you quite enough already. Please don't think of it. If you insist I shall go too, foot or no foot.'

'But you cannot possibly go,' she said, with a wrinkle in the broad white brow.

'I don't know whether I can or not; but I shall certainly try if you do. Perhaps my man will follow my tracks. He's a sensible fellow; been in the army, you know, and has his wits about him.'

The girl hesitated. The journey was not a tempting one, and he looked obstinate enough to do as he said.

'The snow will long since have covered your tracks,' she said. 'But I could send a letter,' looking doubtfully at the dog.

'By Colin? Capital! That solves the difficulty. Shall I write? Where will he take it?'

'To the village, and he will bark until they take the letter from him.'

'Good dog! If you could oblige me with a scrap of paper and a pencil I will tell Tom Brading what to do.'

He told Brading briefly of his accident, and how and where he was situated, and bade him consult

with the schoolmaster and old Donald as to the best means of getting him home. It would mean porterage of some kind, he feared, as his foot was still swelling and very painful.

Miss Leslie placed his letter in a tiny leather bag, which she buckled to the dog's collar with difficulty on account of his exuberant delight at the prospect of a three-mile scamper through the snow. He knew perfectly what was required of him; and when she had given him a final commendatory pat and opened the door, he was off like a shot, and they heard his joyous barks fade away along the hillside.

'It looks like being a big storm, I'm afraid,' said Carrick.

'I am afraid so,' she said, and passed into the inner room.

She was back presently with a basin and a kettle, and a bottle and a roll of medicinal bandaging.

'You should bathe your foot as hot as you can bear it; then put on some of this, and bind it up very tight,' she said, in the tone of a Samaritan constrained to good deeds against her liking.

'You are very kind,' he said, and proceeded to carry out her instructions, while she flitted to and fro, setting the table for a meal, and busying herself in the kitchen.

'I am absolutely ashamed of imposing myself on you in this way, Miss Leslie,' said Carrick, and he looked it.

'There is no need,' she said simply, and left him to his medicaments.

(To be continued.)

CURIOSITIES OF A SEED-WAREHOUSE.

By Carnochan Douglas.

THE remarkable tulip-mania which swept over Holland three hundred years ago, when the cost of bulbs rose above that of the most precious metals—as much as four thousand five hundred florins being paid for a single root—still remains without a parallel in the history of gardening. Nevertheless, far larger sums change hands in a season over simple seeds than the outside public, however devoted it may be to the art of gardening, has any idea of.

Take the innocent sweet-pea, for instance. Who would believe that, of the better varieties, an average wholesale price for its seeds may be estimated at from one hundred to three hundred pounds per ton; and that anywhere from fifty thousand to one hundred thousand pounds would represent the output, wholesale, in one season alone? A specially choice novelty would command at least five pounds per ounce retail—which would total out to one hundred and seventy-nine thousand two hundred pounds per ton, if such a quantity were ever required. This is a truly astonishing figure—an ample fortune for many a man.

As compared to these, we find the cost of the cheaper varieties of seeds—say, the common convolvulus—would probably amount to only fifty-six pounds per ton wholesale.

Even so, the vegetable and agricultural seeds vary in representative money value: cauliflower, onion, celery, parsnip, mangold, swede, turnip, clover and grass seeds, all differ in price according to their quality and novelty.

It is obvious that the enormous quantities of seed required are not grown within the British Isles; they are gathered together from every corner of the world, and the intermediary between the grower and the retailer or market-gardener is the wholesale seed-merchant.

The heads of these wholesale houses are not known to the general public. Advertising in any form is as strictly tabooed as it is by the members of the Royal College of Surgeons; the retail houses only may advertise to their heart's content.

The bulk of the seed imported is temporarily stored in large warehouses, whose mysteries are strictly guarded and inaccessible to the outsider.

The flower-seed department alone of one of these large depositories occupies a whole building consisting of a basement and four floors. The ground-floor is entered through massive double iron fireproof doors, which effectively protect it from fire and thieves.

In the centre of this floor are large bins filled with seeds, mainly sweet-peas; whilst round the sides run long fixed counters where men are busily employed, one of each couple weighing out the quantity ordered, whilst the other puts it into seed 'pockets' or brown-paper bags, according to the size required.

Behind these workers the walls are lined with innumerable drawers filled with loose seed. These contain every known variety of flower-seed carefully labelled each with its Latin name. Some of these drawers, when filled with choice kinds of seeds, such as primulas and cinerarias, represent an enormous money value. One pound of such seed would cost from one hundred and thirty to two hundred pounds wholesale; or a choice petunia-seed, for example, would range at about ten pounds ten shillings for a single ounce.

On the next floor, in place of the drawers of seed, part of the walls are filled with pigeon-holes, into which the packets of different varieties of seeds are put. At the counters in front of the pigeon-holes men and women are engaged rapidly filling and making up the packets, which are placed in the holes ready for despatch at a moment's notice.

The centre of the floor of the third story is piled

high with sacks to replenish the drawers and bins on the lower floors. Here are bales and bales of nasturtium-seed from Great Britain and the Continent; tons and tons of sweet-pea seed from California; also tons of mignonette-seed harvested on the banks of the Loire, the native land of Margaret of Anjou, queen of our Henry VI., or grown on the fields near the Bodethal, in the neighbourhood of the fairy-haunted Brocken; whilst the rest was harvested in Essex. In addition to all these, there are innumerable bags of marigold and eschscholtzia seed.

On the shelves that flank the sides of this granary are placed smaller-sized bags containing costlier varieties of different seeds—one with six and a half pounds of a choice variety of pansy, representing a money value (wholesale) of eighty-four pounds. Asters are there in endless variety, for of these seeds some growers order as many as twenty pounds to be used for cut flowers alone.

A large portion of the top floor is covered with bags of seed piled high to the ceiling, which are likewise used to replenish the stock on the lower floors. The more interesting portion of this story, however, is that part partitioned off with strong wire-netting and securely locked. Behind this stout barricade are kept what are known as the stock seeds of the firm. These seeds have been carefully selected and improved on the firm's own trial-grounds, to ensure that the seed for disposal one or two years hence may be of the very best strain. These are sent to those countries whose climates are best suited to their reproduction and their products, and received back after harvest. Before the seed thus obtained is allowed to pass into the hands of the retailer it is once more tested to see if its growth is perfect.

As in the case of famous racehorses, the pedigrees of these precious stock-seeds are carefully preserved in large, heavy-locked ledgers, so that the family tree of each class of seed may be readily traced back through generations of ancestors. This is a highly important and intricate part of the detail of the business.

The trial-grounds on which these test results are obtained are likewise replete with interest. The seeds to be tested are sown in short rows, each row being numbered, and a full description kept in the firm's books. When the blooms have reached maturity they are examined as to colour, habit, size, &c., and should any 'rogues' be present they are carefully noted in the firm's trial-books.

In another warehouse there is to be seen a large staff busy with the execution of orders for bulbs. These also had travelled far and wide ere they reached the heart of foggy London. The bulk came from Holland; for instance, such hyacinths as Czar Peter and La Grandesse, with their gorgeous scented blooms, or the stately *Tulipa Gregii* and delicately tinted Murillo tulips. There are, however, also lilies from Japan, freesias from France and Sicily, beautiful ranunculi from Italy and Anjou, not to mention narcissi from the Channel and Scilly Isles, tuberoses from the United States, and lily of the valley from Germany.

The vegetable department is equally fascinating. For example, Rochfort's Market, one of the choicer varieties of cucumber-seed, has a wholesale value of about eighteen shillings per ounce, or thirty-two thousand two hundred and fifty-six pounds per ton —if such an immense quantity were required by any individual, which is never the case.

When we realise that one ton of this seed might, on an average, produce something like seven hundred and sixteen million eight hundred thousand cucumber plants, we may have some faint idea of the truly appalling and colossal vista of indigestion for which it would be responsible should an unwary public have no proper regard for its *petites Maries*.

Cauliflower-seed is here in abundance, and not less interesting from the fact that it has been grown on the slopes of Mount Vesuvius and fertilised by the lava poured out in past ages, possibly even by that which engulfed historic Herculaneum itself.

Tiers and tiers of sacks are piled high up on this floor, all filled with broad beans, the greater part of the early varieties of which have been grown near Seville or on the plains of Italy. Quantities of peas of all varieties are collected on another floor, hundreds of tons of the seed of this favourite vegetable passing through the building in one season. Hundreds of bushels of these have come the three months' journey by sailing-vessel from New Zealand; others have been brought from Canada; others again have been harvested in the fertile plains of Germany near the Hartz Mountains.

Elsewhere are stored immense quantities of the scarlet-runner bean. How little the amateur gardener, when he invests threepence in half a pint for his garden, knows about his purchase, or realises how far these beans may have come! There flashes through his mind no picture of the districts in far-away Galicia, behind the Carpathians, where they have been harvested. The work of farming and harvesting these beans is done mainly by peasants quaintly dressed in their native garb of sheepskins, who cultivate small portions of ground. After harvest these men flock to the local markets, each with the produce of his small plot of land, which he disposes of to the buyer. The buyers, chiefly Jews, make a good profit as middlemen between the peasant cultivators and the British wholesale merchant, and hundreds of bushels of beans are thus sent *viâ* Danzig and Hamburg to London. In a lofty granary are piled quantities of radish-seed, of which some growers plant as many as twenty bushels. How insignificant seems the ordinary ounce one buys when compared with this! Close by are stored tons and tons of the seed from which our favourite spring onion is raised, and which claims southern France as its home.

It is wonderful to note the care necessary for the production of those velvety lawns for which the British Isles are so famous. The answer given by the old gardener at one of the Oxford colleges to

the American who asked him for his lawn-recipe does not quite suffice.

'You cuts un and rolls un and cuts un and rolls un,' replied the old man.

'Is that all that is required?' asked the stranger.

'Ye-es, just cuts un and rolls un for two hundred years, or more, and you gets your lawn all right.'

Something more is required than even this, however. The seed has been collected from many countries. Germany, Holland, Canada, New Zealand, Ireland, and the county of Kent all contribute their share towards it. The different samples thus obtained are thoroughly cleaned and 'screened,' so that no foreign weed may remain. The natural grasses are then mixed with just as great care as the tea-merchant devotes to the blending of his teas or the chemist to the making-up of an important and intricate medicine; indeed, the sheet descriptive of the ingredients resembles nothing more than a doctor's prescription. The quantities of each variety are all accurately specified and the names written in Latin (Latin, be it said, peculiar to the seedsman and scarcely admissible in classic circles).

Another interesting department is that of the pea-pickers. About a hundred women are employed for the work. They are seated in rows at desk-shaped benches, and bright and happy they look working away as their tongues keep tune to their hands. Rapidly they pick out the bad peas and allow the good to fall through a hole in the desk into a bag beneath. This bad seed, when carefully separated, is used for feeding purposes. In an ordinary way these women pick from five to six bushels per day; but should the peas be weathered, as in the last season, it might take two days to pick a single bushel.

Wonderful to tell, the seedsman has also his incubator. In a room at the top of one of the buildings are found hundreds of small pots containing growing seeds. These are tests to ascertain whether or not the seeds will really grow, and in this way every lot of seed which comes into the warehouse is at once sampled—that is, fifty or one hundred seeds are counted out and placed in the testing-chamber. The results of these growths are recorded in a book, and later transferred by the testing-man into the large locked ledgers which have been already mentioned; thus percentages of the growths are obtained.

To prove the correctness of these results, a duplicate sample of seeds is put into an incubator, much after the fashion adopted by the scientist to propagate his bacilli. The seeds are wrapped in blotting-paper, then put on thick sheets of the same, and placed on zinc trays; they are then thoroughly damped and left in a hot chamber to germinate, which takes about two days. The necessity of the portly pedigree-books becomes at once apparent, because no matter what information is required, they can give it all. At a glance one can see what quantity of stock exists, where grown, and from what parentage.

The busiest time in one of these warehouses is naturally from November until February, when enormous quantities of seeds and bulbs pass through the buildings, and any one who is then lucky enough to obtain permission to visit one of these closely guarded depositories, teeming with interest, will scarcely regret the hour thus spent.

DIPLOMACY.

CHAPTER II.

PUNCTUALLY at half-past three Lady Fortesque set out for her promised call. The cobs trotted steadily through the park and surrounding plantations, rabbits and pheasants moving leisurely from the grass-border of the winding drive into the thick cover on either side as the carriage passed. Once through the lodge-gate at the foot of the slope, they dashed at a brisker pace past the ruins of the Abbey and along the level mile of road that separated the park from the village, but were checked to a quick walk as they ascended the cottage-studded hill. The lord of the manor of Bredon was proud of the village, and of the fact that there were no two houses alike in it—forty years of judicious repair and patching having been successful in retaining the century-old cottages, whether of stone, red brick, or timber-work, in snug and habitable repair. Men touched their hats, and more than one woman came hastily to her door to make her curtsey and receive Lady Fortesque's pleasant smile and nod in return; for the baronet and his wife having adhered to their resolution to dwell among their own people, the old-fashioned relations between landowner and tenant still obtained in the village, notwithstanding that coal-pits and ironworks were plainly visible from the summit of Bredon Hill.

Lady Fortesque stopped at a house which presented a shoulder of back premises to the road, and telling the groom to return for her in two hours' time, opened the little wicket of the garden. At an open casement-window which looked upon a sloping lawn her visitor of the morning was seated with a book, which she still held as she welcomed Lady Fortesque in the porch. The girl's eyes were bright with eager anxiety and expectation; but she said nothing as she led the way to a low, quaint drawing-room where her aunt was seated by a smouldering fire.

Miss Manners, to whose care Dorothy's mother—a sister much younger than herself—had left her

orphan child fifteen years ago, was a little old lady, plain in features but dainty in dress and movement. Any pleasure she felt in seeing Lady Fortesque—and nobody could have been more welcome to her at that moment—was to a great extent concealed by a formal and somewhat cold precision of manner. Her guest being seated in a low chair near to her own, she turned to her niece.

'Dorothy, my dear, I will get you, with Lady Fortesque's permission, to carry a small parcel which you will find on the dining-room sideboard to Mrs Deaves. I shall be glad to know how she is to-day.'

Dorothy, considerably relieved, disappeared, and for ten minutes the conversation meandered through a series of commonplaces, the elder lady evidently skirting the brink of some more serious depth into which she longed, yet hesitated, to plunge. At length her visitor, who felt herself in possession of the situation, determined to give her old friend a lead.

'Dorothy looks well,' she remarked.

'Dorothy—oh yes,' said the old lady, with the nervous flutter of one conscious of having received a sudden push—as indeed she had; then, making a decided half-turn in her chair towards Lady Fortesque, she went on: 'I am really quite glad—particularly glad, I may say—that you happened to call this afternoon, my dear Lady Fortesque, for I feel myself—that is—I am rather troubled about Dorothy.'

Lady Fortesque's features expressed sympathy without the assistance of her lips, and Miss Manners continued:

'Not about her health—which, as you say, is excellent; nor her conduct—always a dear, dutiful child to me; but the fact is, I have received a letter—it came yesterday—which gives me very great anxiety.'

Here she paused, but Lady Fortesque decided to await greater explicitness in the safety of silence.

'It is from a gentleman—a young man, you know—who wishes to marry her—ultimately that is, of course.' Having at last disgorged her secret, Miss Manners leaned back in her chair with a momentary air of relief.

'Indeed? And, meanwhile, I suppose he writes to ask your sanction to their engagement?'

'Yes, that is what I gather.'

'Well, his writing thus to you speaks for his good feeling and honour—especially nowadays, does it not? when young people are so much inclined to settle such things entirely between themselves. And the young man is'——

'It is young Mr Maddison.'

'Ah! Well, it is only what I should have expected of him, certainly; a more upright, gentlemanly young fellow I do not know, and I have known him twenty years. Dorothy is young, of course; but they can wait. You will soon set their anxiety at rest—or perhaps have done so already.'

'No—no. I have not written as yet, and I have said nothing to Dorothy.'

'Does she know of his application to you?'

'No. I gather from his letter that any understanding between them must be merely—tacit.'

'Dorothy is unaware of his having written, then?'

'Yes—that is—she did indeed bring up the letter, I believe. Yes, the post was late, and Jane had already brought up my early cup of tea. So she may have suspected.'

'Most probably,' said Lady Fortesque.

Miss Manners fingered her shawl nervously for a minute in silence. 'It is, as you say, a straightforward course to take. I could show you the letter'—but she did not pursue any half-formed resolution to do so—'and the young man's character is, of course, excellent, in many ways; but it is not what I should have chosen for Dorothy—not at all!'

Lady Fortesque smiled.

'For Dorothy we should all like to choose perfection, I am sure; but I do not think that Frank Maddison falls so far short of that as to give much cause for doubt as to her happiness with him.'

Miss Manners shook her head slightly and looked steadily at the carpet.

'I fear his views on Church matters are very wanting—in firmness,' she said at length.

Lady Fortesque prudently held her tongue.

'I could wish dear Dorothy's husband, when she has one—especially if a clergyman—to be a person prepared to make a firm stand against indifference to ritual—and to—to so many things.' Then, with a not very successful air of changing the subject, she added, 'I suppose we shall soon be having the new rector announced?'

'Very shortly, I think, you may expect news.'

Miss Manners looked a score of questions, and Lady Fortesque went on.

'There have been reasons for the delay; indeed, Sir John has not even yet announced his decision to me; but I have reason to think his choice will give general satisfaction.'

Miss Manners looked as if she were doubtful as to her feelings following the general current.

'Sir John, like you, finds it difficult to get absolutely everything he would like. But when there are solid, sterling qualities, one must put up with slight differences of opinion in unessentials. That is so, is it not?'

Again Miss Manners shook her head slightly to herself. After a moment's silence she ventured another cast of her line.

'Sir John will probably appoint some one whom he knows well?'

'Well, you know Sir John's regard for old things in general, and old friends in particular.'

Miss Manners determined to try a more circuitous method.

'If I declined—that is, refused my consent to Mr Maddison's proposal—it would be awkward if he should happen to settle anywhere near?' she said.

Lady Fortesque smiled enigmatically.

'It would, of course. On the other hand, if you

decide to sanction the engagement, and he *should* come into the neighbourhood, it would be pleasant always to have Dorothy somewhere near at hand. You and she will both feel parting after so many years of love and kindness.'

Both words and tone struck home, and a tear rolled down the thin cheek of the elder lady. There was silence for a minute; then, as the click of the garden-gate announced Dorothy's return, Miss Manners, feeling herself in a sad dilemma, did what was with her a rare thing.

'What would you suggest—that is, if you were in my place? I merely ask—of course I must consider.'

'Of course, dear Miss Manners, you must act on your own discretion—which, I think, is not likely to fail you. But as a good foundation of pounds, shillings, and pence is desirable for married life, and Frank's fortune is small, what if you were to tell him that before any definite engagement is entered into you would wish him to have a living in prospect?—a curacy is such a terribly uncertain thing, of course.'

Dorothy's entrance was followed by tea, and soon after Lady Fortesque drove away.

As she kissed Dorothy at the gate she said, 'Cheer up, my dear; I think things will go well—after a time at any rate.'

. . . . . .

'Poor Frank!' thought Lady Fortesque, as she drove home through the fragrant evening air, 'between Sir John's fear of high ritual and doctrine, and Miss Manners's desire for it, a middle course seems likely to contradict the proverb and to bring you anything but safety. But let me see if I cannot steer your barque successfully between Scylla and Charybdis, and so bring you into the port of a comfortable living and a sweet wife. Only, I must lose no time, for there is none to spare.'

That evening, when the baronet and his wife had adjourned to the library after dinner, and the candles were lit, Lady Fortesque opened the last battery upon her unsuspecting husband.

'John, we must, I fear, begin to look forward to losing a friend.'

'Eh—what?' exclaimed Sir John, starting out of a speculation as to the result of a new theory for improving damaged hay, propounded to him that afternoon by an enterprising tenant. 'Lose a friend, Augusta? No one ill, I hope?'

'No; but a certain lady is growing weary of a single life.' Then, as her husband continued to regard her with utter bewilderment, she added, 'Dorothy is as good as engaged, I think.'

'Dorothy! You don't say so. And to whom, pray?'

'To Frank Maddison.'

'Did she tell you so?'

'I had a cup of tea with Miss Manners this afternoon. The old lady has had a letter from Frank, asking her sanction of the engagement.'

'Umph! She'll consent, of course.'

'Yes, I think so; but reluctantly. She thinks Frank "Low"—a different point of view from yours, you see,' said Lady Fortesque, with a little laugh.

The baronet sat in silence. The news was, as his wife had foreseen, a great blow, for the girl was very dear to the childless couple. Lady Fortesque fired another volley.

'I am sorry in a way—selfishly, of course. One could not hope to keep Dorothy near us for ever, but that doesn't make the prospect of parting any the lighter. These changes don't suit old people like us, John.'

Her husband uncrossed his legs and shifted in his chair with an impatient movement. Lady Fortesque went on.

'I certainly could not wish her a better husband, and so I told Miss Manners.'

'Good husband enough, as far as that goes; but why could she not marry some one in the neighbourhood?'

'I think I should be as much at a loss to select a husband in the neighbourhood that would meet your approval—not to speak of Dorothy's—as I was this morning with the clergy. Well, John, I am a little tired, so will leave you to finish your cigar.' And Lady Fortesque left the room.

Any thought Sir John had entertained of justifying his decision by argument had to be abandoned. Looking into the dying embers of the fire, he did indeed attempt to adjust the pros and cons of the question of the living fairly in his own mind. But he found the task a difficult one. And here was a fresh complication—a new wrench out of the old groove threatened him. Dorothy going—would be gone in no time—young folks were so impatient. The child he had danced on his knee, and who was but a child still in his eyes! Going goodness only knew where—to some factory-town perhaps, for there were good livings in such places, and the lad would get a living quickly enough, no doubt. He was clever—yes, and a good lad too—just like his father in face and manner. His father—there again, poor Maddison! Many a kindness he had had from him when he, John Fortesque, was pitchforked, a raw country boy, into the little world of Rugby—for the Fortesques had always been a stay-at-home race. Yes, many a kindness had Jack Maddison done him; and now he was going to return them by passing over his only son, and giving the little he had to give to a stranger.

The baronet brushed his hand across his grizzled eyebrows and started to his feet.

'No, no,' he muttered to himself, 'I'm getting an old fellow and can't understand these newfangled notions; but I know the difference between gratitude and ingratitude. Let's live by the lights we have—they'll last my time.'

He seated himself at the great oak writing-desk at his elbow, and for ten minutes his pen scratched vigorously. Then he rose from his seat and rang the bell.

'Wade,' said he to the old butler who answered the summons, 'see that the postman has this when he comes in the morning. I want it to catch the midday post. You can put the lights out, Wade —good-night!'

The morning hours are well known to bring 'cool reflection' upon many a deed done overnight; and though Sir John by no means regretted his sudden decision and consequent action of the evening before, yet he prudently decided to await an answer to his letter before telling Lady Fortesque of the step he had taken to rid himself of the load of care which had gathered on his shoulders. It was not impossible that Frank might already have received the offer of a living; at any rate, he would not shout till he was safely out of the wood. But the second morning brought Frank's letter of grateful acceptance, and set his fears at rest. He passed it to his wife.

'My dear,' he said, 'I've offered the living to Frank Maddison, and he's coming. I suppose his views are rather beyond my comprehension, and I don't quite know how he'll get on here. But I can't pass over the son of one of my oldest friends. If he does wrong it's his fault, not mine.'

Tears sprang to Lady Fortesque's eyes as she laid her hand on her husband's.

'My dear, you have come to a very wise decision, as I knew you would. Believe me, you will never regret it.'

Nor did Frank Maddison ever give his patron cause.

Later in the day Dorothy appeared, radiant with happiness.

'Oh, Lady Fortesque, only fancy! I have heard from Frank, and we are to be engaged. Auntie wrote to say "Yes" after you called. And—oh, but of course you know what else!'

Lady Fortesque placed her hands on the girl's shoulders, and looked into her happy face with kindly, smiling eyes.

'What else, you greedy child? Surely nothing else was wanted after that?'

'Yes, because auntie said there must be no definite engagement till Frank got a living; and Sir John offered him Bredon by the very same post, and I know you did it all.'

And diplomacy being no longer necessary, Lady Fortesque did not deny it.

THE END.

IN THE ALBAN HILLS.

WHEN the spring in Rome—which is, of course, much earlier than it is with us—begins to advance, and the air is full of the scent of orange-blossom; when the picturesque green carts of the venders of lemonade and *gelati* appear; when the morning cry of '*Ricotta fresca*' gives place to that of '*Acqua acetosa*,' and the town goes fast asleep between the hours of 11 A.M. and 3 P.M., then the few *forestieri* who have lingered to enjoy the delights of the Eternal City begin to think longingly of fresher air and cooler heights. We were among these after our winter sojourn, and I suggested to my commanding officer that a month in the Alban Hills would be delightful, and that, if he would only accompany me there, I would make everything easy, so that there should be no rough places for his feet to tread on. '*Facilis descensus Averni*,' quoted he with much irrelevancy, for we were going up, not down, and I hoped that we should find ourselves in a paradise of cool breezes and mountain air, after the heat in Rome, which was just beginning to be trying, and from which we were longing to escape. Often, as we drove along the Appian Way, over the hot stretches of the Campagna, we lifted up our eyes to the hills, and thought that from thence would come our help. But, although we scoured the surrounding villages, it was very difficult to find anything in the way of comfortable lodging, and the hotels were most unpromising; so we had almost given up the hope of finding what would suit us, when a friend who had a small house in one of the hill-villages most kindly offered it to us, as she was suddenly recalled to England, and could no longer occupy it that season.

I must mention that my friend is a very brave woman. She was the only *forestiera* in the village —as far as I could make out, the only person above the rank of a peasant, excepting perhaps the village priest—and she used to walk all over the surrounding hills and country with only her dog for company and protection. I felt too cowardly for this; but then I had the C.O., who, though he thinks me rather a nuisance when I ask to be escorted to some delightfully sketchable but out-of-the-way spot, is yet far too chivalrous to desert me and leave me a prey to Campagna dogs (which are first-cousins to wolves) or to predatory brigands. So, after a little discussion, his 'Nay, nay,' becomes 'Yea, yea,' and we prepare to migrate.

It is late on a lovely spring afternoon as we steam slowly across the Campagna through a sea of golden mist which fades into dim, blue distances where lies our goal, a village perched high above the calm waters of Lake Albano. At the little station we find Emilio—a *vetturino* known to us in Rome—who is to drive us up the hill to Casa D., where our two maids, Marietta and Veronica, are already awaiting our arrival. Long before we reach the house we see their heads hanging out of the window, and they rush tumultuously down the stair to greet us, chattering with true Italian volubility, and pouring

forth their delight with everything: the house, the furniture, the village, the people, the kitchen, and the view. '*Venga, venga, signora,*' they cry, and I am half-pushed, half-carried up a good many steep stairs, till I reach the *appartamento* and am dragged triumphantly to the wide-open window.

What a view! Far, far away on the horizon lies a faint blue streak which I know is the Mediterranean merging into the deeper blue of the Campagna, itself a sea into which have been engulfed so many centuries. Here and there an ancient ruin of tomb or temple, splendid in decay, is touched by the declining sun, and the medieval fortress of the Savelli, which once gazed proudly down on them, is crumbling to the same ruin, sinking to the same decay. But the forest of great ilexes to our right stands firm, and the centuries only add to its strength and beauty; a temple not made with hands, into which, spring after spring, come cyclamen and anemones, 'the pied wind-flowers,' golden daffodils and narcissi, 'the fairest among them all,' to worship in serried ranks. The tall spires of the cypress-trees sway gently to and fro in the faintly stirring breeze, whispering softly to each other. Of what hidden things do they discourse? What stories of generations passed away, of lovers' vows, of deeds of blood and rapine do they tell? They have seen them all; but, though I strain my ears, I catch no echo of those ancient tales. They keep their secrets and nod their graceful heads to each other as though in pity for us modern mortals who know so little. Away on the horizon, almost lost in the evening mists, looms the great dome of St Peter's, which scarcely ever seems to be blotted out. If at any time storm or rain-clouds obscure it for a moment, the peasants are unhappy and look for some great calamity.

Marietta draws me back to prose with a demand that I shall at once proceed to admire the kitchen, to her by far the most important room in the house, the casket in which her genius—and she *is* a culinary genius—is to be enshrined. And I find the kitchen is a poem too, for 'Soracte' has invaded it; the cupola of the old church looks in at the window, dark against the primrose evening sky; and the joyful clangour of the bells says, 'Good people, come and pray, come and pray.'

It is a muezzin which calls me to the house-top, from which I look sheer down (for our village is set on a hill) into the clear depths of Lake Albano, where I see reflected in its calm waters Monte Cavo and the modern church and convent which have replaced the magnificent temple of the Latian Jupiter once crowning its summit, where those Roman generals, who for some reason were denied the honour of a triumph at the Capitol, could receive a kind of minor triumph called an ovation, and where they were crowned with myrtle instead of laurel.

But the sun sinks, and quickly comes the dark; a somewhat icy chill sweeps up from the plain below. I hasten down to unpack and arrange the few books and sketches we have brought with us, and to the unwritten poem of Marietta's excellent dinner. How she manages to provide it I know not. Her kitchen-range consists of what an English cook would call two small holes in a hot-plate, and declare to be absolutely incapable of cooking anything. But there it is, tempting and dainty as though manipulated by Soyer himself, though I doubt whether even he could have produced such delicious *spaghetti* or such succulent *salt' in bocca*. These dainties are washed down by the wine of the country, cheap and delicious; and, hungry after our journey, the C.O. and I do full justice to Marietta's cookery. It is too late and too dark to explore on the first evening, so we retire to rest, to be serenaded by the nightingales in the gardens of the Villa Barberini, and to listen to the croaking of the frogs that hold their parliament in the garden by the lake, and apparently have a Speaker and a good many Irish members whom he in vain endeavours to silence.

Our village, from the time of Pope Urban VIII. (Barberini) up to 1870, was the summer residence of the Popes, and Pius IX. was often to be met riding on his milk-white mule and attended by his Court and Cardinals. Now the palace is closed and the gardens neglected, though perhaps they have gained in beauty by being left to their own wild, natural luxuriance.

Two roads lead from Castello to Albano, the *gallerie di sopra e di sotto*. They are overhung by magnificent old trees, ilexes for the most part. Oddly enough, the trees belong to the Pope and the road to the municipality (at least so we were told); but I never could discover who was the owner of the roots.

In the morning we are roused by hearing Natale, who afterwards proves to be our much-valued factotum, carrying in barrels of water, our supply for the day; and we rise and dress with all the speed we can command, knowing how much we want to see and do. But there are many interruptions: the life of the village street, as seen from my window, is so picturesque and amusing! Here are orange and lemon sellers with barrows piled with the golden fruit, fresh, I am sure, from the Garden of the Hesperides, delicious little wood-strawberries from Nemi, and a cart containing *finocchi* (fennel), onions, and potatoes. This one is greatly patronised by the villagers, who appear to live principally on beans (*fagioli*), *finocchi*, and garlic. Then the village priest comes by on his way to church; all the children run to him, and, curtseying, kiss the trembling old hand which he lays on their heads and blesses them as they trot off to school. Presently we hear the murmuring of a chant, and a humble funeral climbs the hill—a simple coffin enough, with one poor wreath of roses for decoration, but followed by hired mourners all dressed in scarlet and carrying lighted candles: a pagan custom which still survives all over Italy.

After breakfast I have a consultation with

Marietta, who wishes to know if I think the C.O. can live on *finocchi* and beans, as there appears to be nothing else procurable, and the bread turns out uneatable. So I write to Rome to have our bread sent out by parcel post, and then Marietta and I start for Albano, a pleasant drive through the woods, to see what we can find there. I leave her there to struggle with the housekeeping difficulties; and, picking up the C.O., we drive on towards Nemi, through Ariccia and Genzano. We cross the valley, high above the gorge, by a splendid viaduct built by order of Pius IX., probably to render less difficult his own drives from Castello rather than for any other reason. The modern Via Appia is thus carried across, without descending into, the valley.

Emilio points out to us the tombs of the Horatii and Curiatii, a huge square base supporting four cones and a central chamber with many creepers which cling lovingly to the time-stained walls. Unfortunately for us we cannot give absolute credence to Emilio's statement, as we have already seen the sepulchres of these heroes close to Rome, on the old Appian Way; and later, on reference to learned authorities, we are told that it is probably the burial-place of Prince Aruns, the son of Lars Porsenna of Clusium, the opponent of that Horatius who kept the bridge so well 'in the brave days of old.' But neither the C.O. nor I are antiquaries, and it makes small difference to us who found his last resting-place in these grand old ruins, spared by the centuries and dressed by them in mantles of green to hide the scars left by time and war and tumult.

We drive on, sometimes through dim and silent woods—silent, for it is high noon, and the birds are taking their midday siesta—sometimes along the open highway, where golden cistus grows wild by the roadside and the banks are flushed with a blue cloud of forget-me-nots and violets. We see over long stretches of Campagna, whose opalescent hues are ever shifting and changing, to where the misty blue distance of the sea bounds the horizon. It is difficult—nay, impossible—on a hot and hazy day to see where blue Campagna melts into bluer sea; and as I gaze, the centuries roll back. I see Roman galleys riding proudly into Ostia, whose stately temples and villas rise out of the mists of time. Nearer are droves of mules laden with skins of wine, the plebeian's humble wagon, the patrician's chariot, villas whose dimensions almost equal those of a town, altars, shrines, splendid tombs and temples, and cultivation everywhere. Alas! now it is but a malaria-haunted plain, but so beautiful in death that one almost dreads the moment, slowly but surely coming, when advancing Rome will seize it in her arms, will repopulate and cultivate it, and Art and Poetry, which dwell there now, will spread their wings and flee away before approaching civilisation.

Leaving Ariccia—with its lofty dome, its mimulus-covered fountain, and its huge Chigi Palace—behind us, we reach Genzano, known for its wine and for the lovely gardens of the Villa Cesarini, which slope down to the borders of the Lake of Nemi. From the top of the hill we obtain a distant view of Civita Lavinia, which occupies the site of the ancient city of Lanuvium, celebrated for the worship of Juno Sospita. We long to pass beyond its dark and frowning walls of Peperino; but that must be reserved for another day, and soon we turn off to the left and climb the hill to Nemi, sitting aloft on the edge of the cliff which overhangs the lake, towered over by its grand old castle. We meet the peasants coming home with well-filled baskets from the strawberry-beds which now cover the ground once sacred to Diana, singing *stornelli* as they go. They are handsome but poor and ill-fed, a contrast to our Castello folk, who are apparently well nourished and well-to-do. From the top of the hill we get another of the many glorious views which surround us. We look down into the glassy 'mirror of Diana,' as ancient writers call the lake, 'all coiled into itself and round,' and guarding jealously within its waters the ships of Caligula which, possibly, were used to convey the worshippers from the other side of the lake to the famous temple of Diana which once stood on its shores. Nibby, who was present at the investigations carried on in 1827, believed that the pretended ships were only the wooden piles and timbers used in the foundations of a building; but as recently as 1895 it was ascertained by thorough and satisfactory diving that two Roman galleys do actually lie in the embrace of the soft and smiling lake, which clasps them so closely in its arms that up to the present they have resisted all attempts to raise them. But splendid trophies were brought to light: bronze heads of lions and wolves holding mooring-rings in their jaws, a fine head of Medusa, and a water-pipe bearing an inscription from which archæologists have concluded that these galleys were constructed by Caligula about the year 37 A.D.

We have driven almost round the lake, and on the opposite shore we see below us the Villa Cesarini, surrounded by its plane and olive trees, and our sight vaults the hill and is once more met by the golden Campagna.

We turn our horse's head reluctantly; but we have a long drive before us, and it will be late before we reach home, and Marietta's *chef-d'œuvres* and her temper will suffer.

Another day we drive to Grotta Ferrata, passing through the picturesque town of Marino, once a medieval stronghold of the great family of the Orsini, but apparently entirely held by an army of beggars now, who pursue us for a good mile, undeterred by objurgations in the C.O.'s best Italian or even by vicious slashes from Emilio's whip; only exhaustion and want of breath at last cause them to drop off one by one, and we are left to pursue our way through lovely lanes made musical by the tinkling bells of the goats or the deeper tones of those of the convent. We fill the carriage with

wild-flowers: blue, white, and red anemones, cistus, daffodils, cyclamen, violets—almost the last, alas! for they will soon wither up before the scorching breath of summer. The fair one with the golden locks, the lovely yellow banksia, nods at us in great masses of golden bloom over the garden walls as we drive into Grotta Ferrata and make straight for the church and great fortified monastery, which is what we have come to see, and where the service is performed in Greek according to the Greek ritual. It was founded by St Nilus, a Calabrian Greek, who became a monk after the death of his wife, to whom he was tenderly attached. After many adventures he went to Rome, where he opposed Pope Gregory V., who had been set up by the Emperor Otho III. after he had deposed Pope John XV. and put out his eyes.

St Nilus, after writing a strong rebuke to the Emperor, threatening him with the vengeance of God, fled to the spot now called Grotta Ferrata. Here the Virgin appeared to him in a dream, and commanded him to build a church. He placed a picture of her in the grotto, and surrounded it with an iron railing; hence the name Grotta Ferrata. The castellated convent was built in his memory by his friend and successor, St Bartolomeo. At a distance it looks more like a fortress than a monastery; but it possesses a fine campanile of the tenth century. There are some interesting mosaics in the church, the doors are beautifully carved, and in the chapel of the first abbot, St Bartolomeo, are Domenichino's famous frescoes of events in the life of St Nilus.

The villagers are not of particularly good repute, and Emilio tells us that until quite recently he used always to carry a revolver with him; but now the roads and woods are strongly patrolled by the Carabinieri, and are considered to be quite safe within this distance of Rome. Veronica, who has a brother in this fine corps, tells me that farther in the mountains the Carabinieri lead a very perilous life, and if they have to make an arrest, are very likely to get a knife into them for their pains.

It is not late, and we are not tired when we reach home, so after dinner we go for a stroll in the gardens of the Villa Barberini, of which we have the key.

What words can describe the beauties of the sunset as we watch it from the terrace of the villa, perched so high above the plain that we seem to float between the glories of heaven and earth? The hills are soft rose and amethyst, the earth on fire with flames of crimson and orange, a conflagration in which all the ruins seem to burn in a golden furnace. Away in the west a shining streak meets the sunset and melts into it in floods of scarlet light. Above, in the peaceful heavens, light clouds are floating, pale-pink islands in an ocean of tender green and yellow, into which we sail away on the ship called Fancy, trimming the sails of imagination as we go. Then the tender tones deepen, the sunset comes with a rush, the opalescent hues fade; crimson, scarlet, orange, gold, take the western sky by assault, and the sun melts in some giant crucible of the gods. Waves of blue and purple shadow, shot through and through with a rosy splendour, steal over the Campagna, except where from north to south, as if drawn by some titanic brush, lies a streak of sharpest, purest yellow. Then, softly, a dim veil of mist is drawn between us and these glories; the fires fade into gray ashes, a chill creeps up from the plain, and the stars come out one by one. The notes of the nightingale bubble up from the garden behind us, and a little downy owl, who has his home somewhere in the grand old avenue of umbrella-pines, calls to us softly through the twilight. 'Come,' says the C.O., 'it is not safe to stay here any longer;' so we go in, and before long, with an early rise before us, we are in our beds; but the nightingale and the little downy owl have so much to say to me that it is long before I am able to sleep and become unconscious of their importunate voices.

The next few days I devote to sketching, while the C.O. takes long rides and walks in all directions, accompanied by Pasquale, my friend's big white sheep-dog, very friendly to us—we have been introduced—but likely to make himself disagreeable to a troublesome beggar or even to a brigand. We lock up the house; and Marietta, in the intervals of her culinary labours, poses for me, kneeling at a shrine on the public highway, while Veronica carries most of my sketching-traps, and, bringing her work, sits beside me and discourses affably while I paint. Imagine the feelings of an English cook and housemaid under these circumstances! All the *contadini* stop for a chat as they pass, and often offer themselves as models. They are always polite and friendly, and are kind enough to express favourable opinions as to my work. '*Come rassomiglia*,' they say of my picture of Marietta, quite untruly, as I have flattered her greatly and considerably diminished the size of her waist; but whatever their feelings, they are too courteous to do anything but praise.

One day we drive to Frascati through a land of corn and olives, where masses of pink almond-blossom bloom amid the green. The little place boasts of no beauty, and is only important as being the centre of the villas which give its charm to the town. The buildings do not attract us; they are mostly of the seventeenth century, and possess the pretentious ugliness of that period; but the trees are glorious, and there are fine old moss-grown fountains in abundance, and views over the Campagna of surpassing loveliness. The Villas Aldobrandini and Mondragone are considered the finest; but my heart is won by the smaller Villa Falconieri, which possesses an exquisite garden and a tiny green lake which looks like a mirror made from one big polished emerald.

Leaving the carriage at Frascati, we take donkeys for the excursion to Tusculum—at least I mount a

donkey, for the C.O. prefers using his own legs; and, passing through groves of laurustinus and between banks carpeted with wild-flowers, we reach first the slight remains of the small amphitheatre, of which the ruins excavated in 1839 are quite important. Higher still are the remains of the *arx*, or citadel, which was besieged in 457 B.C., and only taken when the garrison was starved out. Its high situation gave it great advantages, as its defenders were able to see a Roman army as it issued from the Porta Latina. Cicero's villa is also a great attraction here. The climb is too much for me, so I leave the C.O. to go on alone; and, enthroning myself on one of the seats of the theatre, I drink in the lovely view over the Latian plains, the soft blues and grays of the distant hills, far away on the horizon Rome, the great dome towering over it, and in the foreground the remains of what were once 'the white streets of Tusculum, the proudest town of all.'

I have time to make a hasty sketch, and Veronica (who, accompanied by the tea-basket, has been brought with us) has prepared our afternoon meal before I am rejoined by the C.O. We greatly enjoy our tea in this invigorating hill-air, and empty the dregs from our cups over a bit of ancient marble pavement where, doubtless, the Romans of old poured to the gods libations of Chian wine from priceless myrrhine cups.

But of all the exquisite views which we find day after day in these most exquisite hills, I love best the one from Rocca di Papa. The village itself clings almost vertically to the volcanic cone on which it is situated, the houses (or hovels) appearing to be built one on the top of the other, the cellars of some standing on the roofs of those beneath them. The people are dirty and savage in appearance, and have an unpleasant reputation for brigandage and violence, though they are picturesque; and the little half-naked children are often of exceeding beauty. Driving through the village and by the beautiful terrace overhung with ilexes, we come to the little church of the Madonna del Tufo, from the platform in front of which we get a view of dream-like loveliness over the Lakes of Albano and Nemi, Castello with its palace and dome, the great rolling Campagna in waves of green, yellow, rose, and violet; and sometimes at sunset may be descried Corsica and Sardinia hanging like gray ghosts on the horizon.

There is so much to see that the days race by with Atalanta-like speed. We pay a visit to the Emissarium, constructed in 394 B.C. in answer to the Oracle, which declared that the Romans should not conquer Veii until the waters of Lake Albano ceased to flow into the sea. We scramble down to the water's edge through thickets of genista, and find the opening enclosed in a lovely *nymphæum*. The *custode* opens the grating, and we set fire to our little paper-boats which the Italians call *fates*, and see them disappearing in the distance, to be carried into the Tiber where the waters empty themselves.

We take another scrambling walk to the Franciscan monastery, gathering hepaticas and every shade and variety of anemone by the way, and examine with much interest a consular tomb cut in the rock.

But the day is approaching when we must leave these lovely Alban Hills and follow the swallows which have already flown northwards. Our last evening comes, our packing is done, Marietta and Veronica are dissolved in tears, and even the cheerful Emilio looks dull and out of spirits.

We take our last walk under the solemn pines; for the last time we watch the sunset from the terrace blazing as if for a burnt-sacrifice; for the last time we watch the moon rise over Monte Cavo and flood the lake with silver. The frogs under our window are more loquacious than usual, and croak what we fervently hope may be '*A rivederci.*' The noisy cicala chatters in the garden below, the little downy owl cries plaintively at intervals, and the nightingale's song, borne on twilight's wings, floats up melodiously from the pines. Monte Cavo looks like a silver mountain and is reflected in the calm waters of the lake. We almost fancy we see a procession of warriors winding their way up the Via Triumphalis, ghosts of the mighty past. All things above, beneath, around us are glorified by the moonlight into a grace and poetry not theirs by day. One by one the stars light up their lamps and hang them in the sky. The mists creep up along the plain and blot the Campagna from our sight.

A TRANSLATION.

FROM SCHEFFEL'S 'TROMPETER VON SÄKKINGEN.'

A God of hatred in this world hath sown,
For every rose is on a thorn-bush grown,
And what poor minds all longingly descry
A parting ends, unlooked for, suddenly.
In thy dear eyes have I the first time read
Of love and joy whose rays therefrom are spread.
O God of Love! 'twere heaven itself in feu;
O God of Love! it never could come true.

Want, sorrow, hatred, with their wearying strife,
Have driven me, storm-tossed, through my wandering life.
Of peaceful hours and still I dreamed, for me,
Along the road that led me forth to thee.
In thy dear arms for me 'twere heaven enow,
To thee my grateful life—to thee—I'd vow.
O God of Love! 'twere heaven itself in feu;
O God! in mercy, can this ne'er come true?

The wind drives through the leaves—on, on, the storm-clouds lead;
Hail, storm, and rain sweep over wood and mead.
Fit storm and rain! when driven from thy home
Life looms before me dark, like yon gray dome.
Let Fortune frown, let Fortune smile benign,
Thou beauteous maid, my senses make me thine.
O God of Love! 'twere heaven itself in feu;
O God! O God! it never can come true.

BEFORE THE DAWN.

A FAINT breeze shivered in the leaves of the aspen-tree. Above the stream lay a long line of mist where the vapour condensed in the chilly morning air. The fields in the distance appeared indistinctly through the gray twilight. Pewits called above the nearer ones, and a sedge-warbler sang continuously from the bushes of the marsh. Bats were returning from their nightly parish haunts and flitting round the old aisle. In the churchyard the light flutter of their wings could be heard—there were so many. Some of them disappeared through the crannies of the loosely slated roof; others came to a wooden-barred window in the end of the church. As the light grew increasing numbers came. Sometimes six or eight bats returned together to the window, like bees to their hive.

While the bats were still coming home, two owls hooted to one another from neighbouring woods. A fainter note preceded the long-drawn *hoo-hoo-hoo-oo* of the nearer one—half screech—as if the bird were clearing its throat. From the open cart-shed barn-swallows twittered, and two presently flew past the church. A wild-duck crossed overhead with whistling flight, returning from feeding among the fields. In the sky to the north-east a steely glare was the only sign of the coming dawn. Overhead the colour grew deeper, and more of a sapphire tint to the south.

As yet the hoot of the owl, the call of the pewit, and the song of the sedge-warbler were the only bird-sounds. But about two o'clock there was a marked stir of life. A redbreast began the general chorus of song. Two blackbirds followed, and a minute after a thrush joined them, whistling loud and clear from the highest sprays of an ash. Chaffinches and willow and common wrens gradually added their song-tribute, and a lark rose into the air to pour forth its matin hymn. *Chee-chee—cheeah*, the yellow-hammer sang lazily in a hawthorn bush. The chilliness of morning gave a crisp, spring feeling to the air, and the swelling song increased the impression of spring. All the promise of the day lies in the morning, as in spring lies all the promise of the year.

Bees were busy among plane-tree blossom, humming pleasantly. Ring-doves cooed, one in the elm-tree by the field-wall. The rookery near the railway sent forth a constant cawing. A cock crowed, and others answered him. The twittering of barn-swallows and house-martins increased. From the moor came the notes of a cuckoo, sounding faint from the distance. Pheasants called in the copse beyond the church. Two horses were eating quietly in a meadow on the other side of the stream. A hare fed quite near them; farther away some cattle were resting. The grass on the embankment was wet with heavy dew. Above, the shivering aspen leaves had two different motions—a circular as well as a swaying one.

Whitethroat, corn-bunting, greenfinch, and more larks had joined the growing bird-chorus. Sometime before sunrise it seems to reach its fullness; then it dies away about dawn, to swell soon after again into a great outburst of song. For more than an hour before dawn the light steadily grew brighter. As we leaned on the tennis-green gate, it was interesting to watch the approaching sunrise. Over the north-east horizon the sky had grown clearer. Suddenly a wave of light swept across the fields. On the green and under the beech-trees the difference was very marked. A strong light seemed to have been turned on all at once where there was a feeble glimmering one before. Across the stream it passed to the woods beyond, then up the rising ground farther away. It was difficult to explain this sudden increase of light; the sun was still a good way beneath the horizon. Nature always works towards her ends by impulses, with sensible pauses between.

A faint rose-tint crept into some cirrus clouds in the north-east. The bright, steely glare moved farther up the sky; to the south, by contrast, the blue had become deeper. A cat returning from hunting the fields crossed the green. Some one was early at work hammering at the metals near the station. *Clank, clank, clank*, sounded clearly on the

[*All Rights Reserved.*]

fresh morning air. Gnats were flying about, and midges had begun to be troublesome; a wasp, heavy with night-dews, lit on a beech-leaf near. In the loose tennis-green wall, hidden by ivy-leaves, was a redbreasts' nest. Every few minutes one of the old birds flew to it with food for the young. They often lighted on the branch of a tree above the wall—not by way of precaution, but for convenience. Neither of the birds betrayed any fear; they had never been molested, though people continually passed the nest.

The rosy flush on the cirrus clouds became more decided, changing to carmine and vermilion tints. A line of carriages on the railway reflected from their windows the ever-brightening glow. The centre of radiance on the horizon was behind a beech-tree in the middle of a field, but it moved slowly to the moor farther east. A sparrow gave a lazy chirp about three o'clock; soon after more began to chirp in the ivy. Starlings were calling and whistling on the roof a little before them. The sparrow is the latest of all the birds to get up of a morning though he goes so early to bed. But, once begun, the bright, cheery chirping drowns for a time with its volume every other sound.

The cirrus clouds were merely touched, at first, on their northern sides with rose and bright carmine from the hidden glow. But as it increased the light saturated those that were nearest to the dawn. The height of the cirrus clouds in the air enabled them to reflect the early sun-rays. Nearer the earth a heavy, vapoury cloud moved slowly; it was still a dull grayish-white. The light increased, changing the carmine tints to saffron. It rose higher with growing brightness. Everything was distinct and clear-cut in this early crystalline light, suggesting a picture by Beattie-Brown. Ring-doves began to coo again; the larks sang louder over the fields. With the increasing clearness the hawthorn showed white from its masses of blossom. Into the fresh morning air they distilled their sweetness like the breath of dawn itself.

The rose and carmine tints had mounted the sky; lower there was a golden glow, lighter than buttercup gold, half-way between the beech-tree and the moor. The heavens in the north-east were beautiful beyond words—an embodied aspiration of beauty. The low-hung cloud caught a portion of the upper radiance. Far above it the cirrus became more and more suffused with golden lights. They were pieces of heavenly cloth that invisible hands had strewed before the coming of the king of day. Each cloud was a centre of radiance. Some smaller ones were like sparks of living flame from an unseen furnace, seraphim, spirits of the dawn. But the loveliness was exhausting. All the heart's powers were too feeble to gather it. Heaven's beauty was a thought too great for the mind.

It became a positive pleasure at last to turn from this overpowering radiance to little earthy details. A heron rose from the stream where it had been fishing through the short summer night. Pewits chased it with scolding cries, and the larger bird doubled, when they came near it, with strangely awkward flight. Overhead the rooks were flying to the fields, one or two of them croaking low and half-complacently. A long goods train rolled slowly past the station, and stopped beyond it to shunt off some heavy-laden wagons. The cat was still among the bushes; two blackbirds, with angry *pink-pink*, sought to drive it away from their young. Another blackbird note of alarm is a long-drawn, plaintive *tseep*.

The centre of light had moved to a fir-tree by the edge of the moor. Its dark branches were transfigured by the glow behind them. The silvery radiance dazzled the sight. Suddenly from the wood a strong ray shot up; the upper edge of the great sun followed it. Higher and higher he rose like a huge shield of burnished silver. The birds sang with renewed energy; from all around came a full-throated concert of song. Earth was beautiful in the new-born light. Over fields and stream and woods it passed, recreating everything. The heart paid its orisons in silent admiration. All nature rejoiced to welcome the risen sun.

GIANT CIRCUMSTANCE.

CHAPTER XXI.—A DAY OF STRANGE HAPPENINGS.

SHE was certainly very charming, both to look at and to listen to. The little room was dark in the shadow of the storm; but the dancing flames glanced on the shining coils of her dark hair and gleamed in her dark eyes, and the dark room brightened each time she entered it. She moved swiftly and silently, and the soft, light sibilants of her Highland speech taught his ear new possibilities of delights in the English tongue. And the veiled hostility which still peeped from her eyes, and was, to him at all events, observable in her manner, added to the charm of her that touch of piquancy which is more bewitching even than mere beauty of face and figure.

What on earth could make her dislike him so? he wondered, and determined to find out. For he placed no unreasonable value on all she had done for him. She would have done just the same for Mr Duncan Cameron or any one else in similar case. He was in need, and the good Samaritan in her would not let her quite pass by on the other side; that was all.

And presently she came in, more charming than ever in a big white apron, and set a smoking dish before him and went quickly out. It was the

inevitable mutton, of course, but not after the style of Mrs Cameron's weird compositions. Dainty cutlets, brown and bread-crumbed, and delicate slices of potato fried and crisp.

He waited for her to return. As she did not come, he rose and limped to the door through which she had gone, and for the first time took note of his surroundings.

The furnishings were not such as one usually meets with in a whitewashed cottage. There was an unusually comfortable and solid-looking couch, two deep, soft easy-chairs (one of which he had just been using), a mahogany table, well-filled hanging bookshelves on the wall, a large shaded reading-lamp, a heavy curtain against the door—all well used and past their prime, but only the more homely and comfortable in consequence.

The impression of all this he took in at a glance; but as he looked at the wall opposite the fireplace, the wall towards which his back had been turned ever since he entered, he came face to face with two large portraits in oils—a man of perhaps sixty, tall, upstanding, bold-faced, in full Highland costume, the costume undoubtedly which he himself was wearing at the moment—and a younger man. And at sight of the young man's face Geoffrey Carrick stood and stared in very great surprise. But staring solves no riddles, so he opened the door.

'Miss Leslie?' he said, pushing open the door.

'Is there anything I can get for you?' and she jumped up hastily from the kitchen-table, where she had been getting her dinner.

'I am only waiting for you.'

'Thank you. I am getting my dinner here.'

'Oh, but you must not. I am dying of hunger, and those cutlets have made me twice as hungry; but I couldn't eat a bite if I thought I was turning you out of the room.'

'But you are not. I often eat in here.'

'Will you add to all your kindness by joining me? Besides, I want to speak to you, and I am really very hungry, and the cutlets are getting cold.'

She carried in her plate without a word, as one might humour a child or confer a favour on an importunate guest.

'Permit me,' he said, and filled up her plate before she could remonstrate. 'These are a very great treat, you must know. Mrs Cameron gives me mutton; but it is surely a different kind of mutton from this.'

He chatted lightly through the meal, for he really was hungry, and he did not want to broach weightier matters to the spoiling of her handiwork. She answered him, when necessary, in a brief word or two, but showed no inclination to unbend. And it was not until pudding and cheese had been disposed of that he said, 'Now, may I ask you a question?'

She looked at him with quiet reserve, but gave him no encouragement.

'I want very much to know why you hate and scorn and detest me. I have been wanting to know for the last three months. Will you please tell me?'

There were implications in his words which sent a flush of conscious colour into her cheeks; but she did not speak.

'I believe you are misjudging me, and I cannot conceive why. I am not conscious of ever having wronged you in any way. Even a criminal is entitled to know the charge against him.'

She regarded him thoughtfully, and knew that he was very much in earnest, and that the matter really had been troubling him.

'You bought Innismohr,' she said with a touch of bitterness.

'I did. It was for sale. Is that against me?' he asked in surprise.

'And you beat down the price.'

'I think you can hardly say that,' he said in quick surprise. 'I told the agents to have it valued, and to offer that amount on my account. Would not you do the same if you were buying an estate you knew absolutely nothing about?'

'And it never struck you that the amount you knocked off might make all the difference in the world to those concerned?'

'It certainly never did. I'm afraid I don't understand even yet.'

But she was on the war-path and could not stop to explain.

'And what is your name?' was her next surprise.

'My name? Geoffrey Carrick, at your service.'

'And who gave you that name?'

He looked at her twinklingly for trace of humour, but the beautiful face was hard and the dark eyes gleamed with battle.

'My godfathers and my—— No, as a matter of fact, it was my uncle, General Carrick, who left me all his money on condition that I took his name.'

'And before that you were that Mr Geoffrey Challis who left the young prince to die among the Arabs;' and there was a ring of scorn in the soft voice.

'And you thought I had changed my name because you also thought I had disgraced it? I see. And how did you know me, Miss Leslie? I am quite sure we never met until three months ago.'

'I knew you as soon as I saw you.'

'You certainly had the advantage of me. May I presume so far as to ask how?'

She pointed to the portrait of the young man on the wall.

'Through my brother, who died out there.'

'Then you are not Miss Leslie, but Miss Cameron?' and he jumped up in his excitement, but dropped into his chair again, since a useless foot is ill-fitted to heroics.

'I am Lesley Cameron. My brother is dead. My father is dead. This is his estate that you have bought, and the little difference between what we wanted for it and what you paid would have made all the difference in the world to my mother and me. It would have given us a pittance to live on, and she is ill'——

'Oh, don't—pray don't! You hurt me. Will you believe me? You must see, Miss Cameron, that I could not possibly know anything of all this, except, indeed, that Evan was dead, for his head was on my knee when he died at Tembé Wells. He was my dearest friend. Surely, if he wrote to you about me at all, he must have told you the true facts.'

'He told us what had happened, and that he believed you would come out all right. After that we heard very little.'

'Then I am sure some of his letters went astray. We were very close friends. He would never knowingly have left me under an imputation. Of that I am certain. You know that I was reinstated?'

'You were engaged to the daughter of the Secretary for War, they said.'

'I was. She is married to Lord Belturbet. She will shortly be Duchess of Cashel. I hate defending myself. In most cases I would not attempt to do so. If people wish to think ill of me they are welcome. It does not affect me in the very slightest, since I am conscious of no wrong. I will tell you one single thing, and if that does not convince you I leave it there. One of the warmest friends I have in London is the Grand Duke of Eisenach, Prince George's father. I called on him as soon as I was free to do so. He had followed the whole matter, as you can imagine he would. He gave me his hand, and has been a true and very dear friend ever since. Largely through him I have the hope of the military attachéship at Vienna, one of the great prizes of army life. Prince George was his only son, his only hope. Can you reconcile these things with any failure on my part?'

'Why did they court-martial you and send you home?' she asked, still unwilling to yield her preconceived notions.

'Ah, now, if I went into that I should have to say hard things of other people, and I have got past it all. I have told you simple facts, but they are weighty ones. Except with my sister and her husband, Lord Exmoor, I have not discussed myself so much since I came home. I have only one other thing to say, Miss Cameron: if I had been in the very slightest degree guilty of what was imputed to me I would never have come home at all. Even as it was, it was far harder to come home than it would have been to stop there. I think you must believe me. I very much wish that you should.'

She was thoughtfully silent for a time. He liked her the better for it. Then she said quietly, 'I will believe you. It was not easy to think ill of one whom Evan had called friend, for he was not quick at making friends. But we could only go on the facts that came to us.'

'I thank you. Now, tell me, where is your mother?'

'She is stopping in your house. I am sorry now. But she had such a craving to be there again, and—well, she is very weak and had strange fancies at times, and I had to humour her.'

'You did quite right. And now you will go and stay there with her for just as long as you wish.'

'No,' with a doubtful shake of the head, 'I think not. It is quite different now.'

'How different? It would please me greatly if you would.'

'If my mother insists on stopping there I would not like to have to take her away. With myself it is different.'

'But how different? I don't understand. Do you mean that when we were enemies you would not have minded stopping there in spite of me, but that now we are friends you won't stop there at all?'

'That is something like what I feel.'

'Well, I will beg of you to think better of it. Your brother would not have objected to stop with me.'

She shook her head doubtfully. 'It is quite different. To stop as a guest where you have lived at home'——

'But, if I understand rightly, you would not have minded stopping there unknown to me, and yet'——

'That again is quite different, you see. I should have helped Mrs Cameron to take care of the house. You would have known nothing about it; and if you had you could not have complained. But now'——

'But now, because it would be a very great pleasure to me to think of you there, you will not do it. That is sheer perversity.'

'Perhaps, when you are gone, if I find it too lonesome here, my good resolution'——

'Perversity.'

'Will give way, and I shall go there for a short time after all.'

'You deprive me of a pleasure.'

She jumped up and began to clear the table—a new creature, her natural self without the cloud.

'I wish I could help you,' he said, with a sudden new sense of enjoyment in the sight of her at her homely duties.

'I'm very glad you can't. This is woman's work. If you will put that kettle in among the peats you can bathe your foot again.'

As she passed the window with her hands full of dishes she gave a startled exclamation and stopped to stare out at the snow.

'You will never be able to get home to-night,' she began.

'It is coming down, isn't it?' said his voice over her shoulder.

'I have never seen it like this before. The drifts will be very dangerous. I doubt if the men will be able to get through themselves. They could never get you back again;' and her brow knitted at this fresh complication.

'I'm sorry. But I'll try and be as little trouble as possible.'

But it was not only of him she was thinking. If the north-easter held they might be penned up there for a week.

Man-like, his thoughts turned to possible commissariat difficulties.

'Are you provisioned for a siege, Miss Lesley, or shall we be reduced to eating our boots?'

'I have plenty of meal and flour, and there is bacon, and still some mutton, and there is half a cheese, and tea and coffee.'

'Oh, come, we shall do famously. It can't last very long, and I'll promise to eat as little as possible.'

But, woman-like, there were to her other considerations of even more importance than these. She had, however, learned during the last twelve months to endure quietly what she could not cure, and so she went soberly to her kitchen to wash up her dishes.

He was still gazing out through the whirling flakes when he caught sight of some dark object slowly approaching in a series of violent bounds, like a dolphin or a wounded kangaroo, and visible only at intervals above the snow. A joyous bark settled its identity, and he hurried to the door.

'Here is Colin back, Miss Lesley!' and she was there as soon as he, just as Colin's final leap brought him to their feet, spent but glad.

He was one mass of snow, and had evidently had a bad passage. Miss Cameron drew him away to the kitchen, and Carrick heard her talking to him in a way that excited his envy; and presently they came in together, Colin cleaned of snow and almost himself again, and she without her apron, and carrying a letter in her hand.

It was from Tom Brading, and told of the fright he had got at sight of the broken ice and no signs of his master. He had run back to the village for help; 'made sure that kelpie thing had got you, and the schoolmaster seemed to think so too, and I'm inclined to think he wasn't half sorry.' Then the dog had come in with the letter just as they were about to start. 'The men say they are not sure we can get through to you, as the snow will pile deep in the gullies, and that if we could get we could not possibly get you home. But if we can't get now they say you'll be all right, as Miss Lesley had supplies in only two days ago, and I'll come first chance that offers. Very glad things is no worse, and that kelpie thing has not got you.—Yours obediently, Tom Brading.'

He handed her the letter, and when she had read it, asked with a smile, 'Do you believe in kelpies, Miss Lesley?'

At which she showed momentary confusion, and then said, 'I do not believe in such things myself, but most of our people do.'

'When it cries aloud, as it did the other night, it is not hard to believe in it. Mr Duncan Cameron did his best to make me believe it was crying for me. But for your assistance to-day the idea would have had an immense impetus. You have helped to knock one of your old legends on the head. I had threatened experiment with a rifle-bullet. Now, I wonder what it was that made that curious noise.'

But she only shook her head, and said quietly, 'There are many strange things among the hills and lochs,' and went away to make preparations for his longer stay, while Colin stretched himself gratefully to twice his usual length in front of the fire and forgot past trials in present enjoyment.

Night fell without any cessation of the snowfall. If the cottage on the hill sheltered any anxiety, it was not in Geoffrey Carrick. On the contrary, and in spite of his twisted foot, which was swollen and painful, he was in a state of suppressed exultation and extreme enjoyment.

The riddle of the months was read, hostility had given place to friendliness, and the great, dark eyes, which had provoked his admiration and troubled his soul with their scorn and dislike, were glorious in their conversion.

For months she had done him gross injustice. In the very nature of things—since by nature she was large-hearted and high-souled—she took shame to herself for her flagrant misjudgment, and the swing of the pendulum made for quick friendship.

He found his tobacco-pouch not very much the worse for its immersion, and took surreptitious advantage of her absence to dry his tobacco.

And presently she came quietly in with the tea-things, and set a little black kettle in the ashes, and knelt by the hearth and tidied it up with gentle little touches of a small brush, with soft pattings here, and lingering caressings there, as though she were ministering enjoyably to the comfort of a dear old friend. And to Carrick, who had not been used to these little homely observances for very many years, the sight of her kneeling there, with the firelight in her face and bronzing her dark hair and haloing her shapely head, was a fascinating one. Every movement was full of quiet grace. She was doing just what she had done a thousand times before, unconscious of anything but a desire for a tidy hearth. But Geoffrey Carrick was aware that somewhere within him there was a great well—nay, a bubbling spring—of rejoicing that the sweet, high face no longer frowned upon him, and that the great, dark eyes no longer regarded him with scorn and detestation and many things besides. And if she, in her new friendliness, was a discovery to him, no less was he to her in the sudden reversal of her hard thought of him, and discoveries such as these strike rosy sparks in lonely hearts.

'I am so very glad you are not what I had been thinking you,' she said suddenly. It was very naïve, very frankly ingenuous, just a glimpse of her true inner self without any conventional veiling, as though she had simply thought aloud. It was the reparation her conscience owed him. It was also very charming.

'I am more than glad that the chance has been given me to set myself right in your eyes,' he said. 'It is always hard to be misjudged, and I have had my full share. It makes one somewhat callous and scornful in return. I thought I had left it all behind me, and it was something of a blow to meet

it full in the face the very first day I got here. I am very grateful to that ice for letting me in.'

'I am very glad you did not call out when you were in,' she said musingly.

'Why?'

'Because if you had done so, I should probably not have come to help you,' was her startling reply.

'Do you mean to say you would have let me drown?'

'Possibly,' she said, nodding thoughtfully at the fire. 'Yes, I think so.'

'I don't believe it.'

'That is how I felt towards you, you know. I hated you. And when we Camerons hate, we hate; and when we—— Oh, I assure you'—she turned her sentence suddenly—'we are very elementary here. It is living so close to nature, I suppose.'

'All the same, I will not believe it. If you saw a dog drowning you would rush in after it.'

'A dog? Of course! Any one would. But that is quite different. I had been watching you from the time you put on your skates, and I said to myself, "Suppose the ice should break and let him in, and he should drown," and the Cameron in me said "Amen!" And then *crack!* and you were in, and I stood and watched you. And then you did not cry out, and I could not stand it, and so I ran down.'

He looked at her in quiet amazement.

'If I had known you were there perhaps I should have called out.'

'I do not think it,' she said, with a decided shake of the head. 'Least of all to me.'

'Well, you did come, and that is the chief thing. I am grateful to the ice, and to you, and to Colin.'

She made the tea and some crisp slices of toast, and offered him cheese.

'We have only tinned milk in the winter-time,' she said apologetically; 'but you could have lemon if you like it better.'

'I am used to tinned things, and have been mighty glad to get them at times. Ass's milk is not bad, and camel's is bearable; but the man who turns up his nose at good tinned milk deserves to starve.'

They sat long over this first friendly meal, and he told her many things: about his sister Ellen and Exmoor, and about his hobby at Grattan Street, and Colonel Trevor, and the Grand Duke.

'Don't you smoke?' she asked suddenly.

'I do, when I may.'

'Please do. I found some tobacco of father's in a drawer the other day;' and she jumped up, and came back with a round tin nearly full. 'And I lit some on a plate just to smell it again, but it did not smell the same. We have always been used to it, and have felt lonesome without it.'

And his pipe was going before she had finished.

'Now,' she said, sitting on the hearth with her hands in her lap, 'will you please tell me all you can remember about Evan. We had nothing but the bare facts, and have longed for more. Bare facts are dreadfully hard upon those at home.'

'If I had known; but, close friends as we were, he never spoke upon home matters. I never even knew that he had a sister.'

'Poor boy! The shadow was over us. Home matters were the last things he would talk about.'

'He was always so brave and cheerful—not in spasms like some of the others, but always. You would not have thought there was a cloud on his horizon. I never remember one single growl from him, and he was always ready to bear a hand at anything. And those sketches and caricatures of his were just a sheer delight to us all, even to his victims. He was amazingly clever that way.'

'I have heaps of them here—you among them. That is how I knew you as soon as I saw you. And George Eisenach, and little Bittrel, and Colonel Everett.'

'It takes one right back into it all,' he said soberly.

'Sometime I will show them to you; but now, please tell me about my brother.'

And he told her the story of the fight at Tembé Wells, and kept himself out of it as much as he could; but that was impossible altogether, and there was much that she would have asked him about himself, but she would not ask him then.

She sat silent for a time when he had done, and the world outside was full of the rush of the storm. It hummed round the little house and bellowed in the chimney, and now and again the snow came whirling down and fell hissing on the fire, and the sweet, thin reek of peat and pine puffed out into the room and tempered the cruder smell of his tobacco.

She rose at last, with a sigh for the past, and then she gave him another surprise.

'You will be tired, and should go to bed early;' and he felt like a little boy again. 'We always have worship.' She placed a couple of books on the table. 'Perhaps you will read.' And he felt as one who has been neglectful at times of outward observances may feel in the presence of a sweeter soul. And an hour ago she had confessed that she might have left him to drown!

He flushed. 'I am but a tongue-tied man in such matters.'

She opened the books where the markers were laid, and said quietly, 'You can read.'

And he read where she indicated, and then a prayer from the other book, and she said, 'Thank you!' and went with Colin to show him to his room, which opened out of the sitting-room.

'I think you will find everything you want,' she said, and held out her hand to bid him 'Good-night,' and the dark eyes that had looked at him with scorn and detestation were soft and shining.

'I thank you most gratefully,' he said, and raised her hand gently to his lips.

She drew it quickly away and went out of the room.

Verily, a day of strange happenings to Geoffrey Carrick!

(To be continued.)

SNAKES AND CHILDREN.

By J. O. Byrne, Sydney.

I HAVE found that children in the bush show very little fear of snakes. The bigger the snake the greater the joy in getting near to it and the stronger the desire to play with it. The snake's bright eyes and sinuous motion probably charm. And snakes, even the most vicious, respect the confidence. I have known numbers of cases in which they returned it with what must be called affection. A snake that will wriggle away from an adult will placidly survey a child and wait for encouragement to approach.

Here is an instance to my hand. We all knew there was a snake in the house. Glimpses of it had been caught on three separate occasions, but it was too swift in getting under cover. Bush houses in Australia are roughly put together, and odds and ends of various sorts are littered about with occasional heavy articles against the walls. To move the heavy things is somewhat dangerous unless the light is good and an experienced bushman be of the party. The usual plan is to watch and wait. The sides of the cottage were built of round timber, and there was a likelihood on each occasion that this particular snake had wriggled through and out.

Minnie, a child of three, was more vivacious than usual next morning. She sat on an opossum-rug on the floor of the room adjoining the breakfast-room, where most of the family were collected. The chattering excited comment. 'Stay,' whispered her father; 'something strikes me. She's talking to something, and I bet it's the snake.'

With his riding-whip in his hand, he stepped softly to the open door and peeped in. The snake had its head on Minnie's lap, and was being fed with little snips off a square of lump-sugar.

It was a black snake of a dangerous size, and the father was doubtful how to act. If alarmed it might viciously attack the child. He surveyed the possible means of escape, and whispered to his wife to call Minnie. The child moved at the call, and the snake drew back and made a sudden dive toward a chest of drawers at the opposite wall. That was what was wanted, and the riding-whip did the rest.

A friend tells me an incident of a similar kind. At Koondrook, a little settlement in Victoria, a woman heard her child, eighteen months old, laughing as if she was having great fun. The child was supposed to be asleep in bed. The mother went to the room, and found the child scrambling over the bed after something she could not see. That happened several times. Once, however, the mother went in suddenly and heard something drop off the bed. Looking hurriedly under the bed, she distinctly saw a large snake, that turned upon her with evident intention to fight. When the husband came home he pulled up the boards of the floor, but there was no sign of the snake. Next day, however, snake and child were discovered lying together on the floor, the child asleep, and the snake apparently so. That night the husband tried a plan. He placed a candle on the floor alongside the child, and asked his wife to play a slow air on the harmonium. Movements of the snake could be heard; but the rustle was all he vouchsafed. Next night the child was similarly posted, and the mother tried the effect of working her sewing-machine. The sound was too tempting. The snake wriggled to the child with alacrity, and was promptly despatched by the father. It was a tiger-snake nearly five feet in length, and when killed was fondled by the child as an old acquaintance.

We never hear in the bush of a snake biting a young child. On the other hand, numbers of cases are recounted in which mothers have laid infants on the bed in dark rooms, and discovered a second later that a snake was underneath the child. The snatching up of the child released the snake, and invariably the trouble ended there.

A governess in charge of a child was fond of sitting among the rocks at the seashore. She read a good deal, and was contented so long as the child played about without making noise. At last—perhaps she had finished her book—it struck her as strange that at that particular place among the rocks the child was always preternaturally quiet. She rose slowly and noiselessly glided to a projecting boulder, behind which she knew the child had crawled. The child was motionless on hands and knees, and was staring at some small object beside a tuft of withered grass. The governess watched intently for several seconds. Gradually she made out two bead-like eyes, like little points of fire, and with further inspection was able to define the small head of a snake similar in colour to the withered grass. A hole ran under the rock, and the snake's head alone protruded. The pupils of the child's eyes were dilated, but in other respects it was half-asleep. This would help the claims of those who endow snakes with a power to fascinate birds. But there was nothing to indicate that the snake in question meant injury to the child.

A bush clergyman visited me on one occasion, and, dismounting, threw his saddle-bag on the veranda. The flap fell open and a green whip-snake popped out. It happened that there was no weapon handy, and the snake disappeared under the house. The clergyman was greatly frightened. He calculated that the snake must have been in his bag during his last ten-mile ride, and reflected that he had put his hand in several times for one article or another. He carefully examined

his right hand for marks of fangs, and became reassured when not a single scratch could be discovered.

We kept a sharp lookout for some days for the snake, and renewed acquaintance with it under singular circumstances. Minnie, the child previously alluded to, was overheard giving something like words of command near the stump of an old iron-bark tree a little way from the end of the house. On stealthily approaching I was thunder-struck. I beckoned to other members of the family to tiptoe to me. It was no optical illusion. There, in real fact, was a green whip-snake dancing before the child. The inference was, of course, that it was the clergyman's whip-snake. Its motions were most grotesque, its head lolling from side to side and occasionally shooting straight up. It evidently danced for the entertainment of the child, and responded with alacrity to her words. The spell was broken by the incautious movement of one of our party; but though the snake made off, it was pursued and despatched.

It is right I should complete this somewhat astounding narrative by adding that the clergyman, on his next visit, complained of having been made the victim of a practical joke on the previous occasion. The hotel-people had placed in his saddle-bag a showman's performing snake, not at all dangerous, and altogether too valuable for the fate that befell it.

But when a snake is pleased or desires to please, it displays, even in its wild state, gyrations which may be described as dancing. I have seen them semi-erect, bobbing heads and moving protruding tongues with a near approach to waltz-time. They are very fond of going partners with infants in the contents of feeding-bottles. While snake and infant take turn about at the bottle, the former will bow and bob and curtsy as assiduously as a pouting pigeon.

A storekeeper, who had a private cottage adjoining his store, closed his garden-gate about eleven o'clock at night and returned to the sitting-room. It had been burning hot all day, and every one was exhausted. He says he was aware of some weight pressing on his shoulders, but was too dead-beat to think about it. On a sofa under the window lay a child with the tube of a feeding-bottle between its lips. The storekeeper soon realised what weighed upon him. A tiger-snake leaped from his shoulders to the sofa and went straight for the feeding-bottle. At the close of an exciting couple of minutes the members of the household had forgotten their exhaustion, and the snake was killed. The storekeeper, in his alarm, made the leap much greater probably than it really was. It is likely, indeed, that he stooped towards the sofa. When his senses were so dulled that he did not feel the reptile crawling on to him from the gate-post, he was not likely to be much of a judge as to how it got off. Snakes do not—in fact, cannot—execute the prodigious jumps with which they are so often credited.

But while it can be held that snakes are friendly to young children, on occasions showing what may be called affection for them, they can be charged with harbouring unstinted enmity for boys and girls of from eight or ten years up. The antipathy appears to be mutual. The bush chronicles an endless war between them. Numbers of boys die from snake-bite year by year. When the bite is on the finger or toe the average bush-boy chops the member off. It is quite a common thing to find two or three of a selector's family short of a finger or toe on this account. It thus happens that devoted friends in childhood become implacable enemies later on.

THE SECRET OF CARONDELET.

THE war between the Northern and Southern States had been ended several years when I, a young fellow of six-and-twenty, set sail from Liverpool to take possession of a sugar-estate in Louisiana which, acting on the advice of a friend whom I had consulted as to what to do with myself and a capital of five thousand pounds, I had purchased. At that time many of the mortgaged estates of the ruined planters were in the market at almost nominal prices; the emancipated negroes, it was said, were willing to work for small wages, and the luxurious lives and great wealth enjoyed by planters before the war were still remembered in England.

I had a pleasant voyage to New Orleans, and after a few days in the strange, half-French, half-Spanish 'Crescent City,' took passage in one of the fine river steamboats for my newly acquired property, which was situated about eighty miles up the Mississippi.

It was evening when I reached Carondelet, and having landed on the wooden stage which abuts from each plantation on the river, stood gazing with a not unnatural interest at my future abode, a huge, three-storied brick building in the form of a cross, with open galleries along the shaft. In front was a wide expanse of grass dotted with giant cedars, and on one side, in what had once been a garden but was now a tangled mass of vines and creepers, the sunset glow fell redly on a white marble tombstone which seemed to stand close beside the windows. Descending from the levee, I was met by a tall, bronzed man, dressed in a blue linen suit, who, taking off his hat, addressed me in French:

'Good-evening, sir. I have the honour to address Mr Selby, have I not?' I bowed. 'Then I have much pleasure in welcoming monsieur to Carondelet.

My name is Felix Imbeaux, at present overseer. I shall be glad to be of service.'

I had heard of this man from the agent through whom I had bought the estate. The mortgagees into whose hands it had fallen had been working it until such time as it should find a purchaser, with Imbeaux as manager. He was, I knew, desirous to remain; he was well recommended, and for the present I had resolved to keep him. Until lately, he told me, he had resided in the mansion, but had now removed to the overseer's cottage near the negro quarters.

A few minutes brought us to the house, which we entered by a side-door opening into a kind of parlour, tolerably well furnished, where was a table laid for supper, to which an old barefooted negress was putting the finishing touches. She grinned, curtsied, and, talking volubly in a strange kind of *patois*, led me through a huge, almost empty dining-room, across a wide, bare hall, and up a black oak staircase to a bedroom on the second floor. It was a large apartment, with low French windows opening on one of the side-galleries, from the farther end of which a flight of steps descended to the ground. Standing in the gallery, I looked down on the neglected garden and white gravestone, upon which, in the fast-dying twilight, I could read that it was erected to the memory of 'Auguste Chaston, aged sixty years,' and that the date of his death was twenty-five years ago. Strange, I thought, that he should be buried here.

On descending to the parlour, I was somewhat disappointed to find Imbeaux had departed. The old negress, however, having brought in an excellent repast, I made a hearty meal, and, the mosquitoes beginning to make themselves unpleasant, went out into the veranda to smoke.

It was quite dark now. The air was heavy with the scent of magnolias, orange-flowers, and jasmine; fireflies darted hither and thither in the gloom; the hoarse bellow of alligators in the distant bayoux mingled with the croaking of frogs and whir of the cicada. The damp heat was oppressive, and, my cigar ended, I began to experience a sense of loneliness, and resolved to send for the overseer. I looked about for the bell, but none was visible. Opening the door which led into the dining-room, I stood listening for any sound that might denote the whereabouts of servants. I called, and my voice echoed strangely through the empty rooms. I would have gone in search of Imbeaux, but it was pitch-dark, and I was uncertain of the way. Picking up an old copy of the *Picayune*, I lit another cigar, and between reading and smoking, beguiled the time till about nine o'clock, when, wearied of my own company, I resolved to go to bed. The French windows of my room had been left open, and the atmosphere being insufferably hot, I did not close them.

I was long sleepless, but after a time fell into a doze. When I awoke the moon had risen, and the light, falling full upon the open gallery, showed everything almost as clearly as in daylight. How long I lay awake I do not know. I was just dozing off again when I was aroused by the sound of a footstep slowly ascending the stairs. A servant, I thought. On coming to bed I had passed through a glass door leading from the top of the staircase to the gallery. The person, whoever it was, seemed to come through this door, walk close past my windows, and descend the steps at the farther end; yet, though my face was turned that way and the intruder must have passed between me and the moonbeams, I saw no one.

The next day I spent on mule-back, riding with Imbeaux about the estate. In the evening I invited him to dinner, and as we sat smoking in the veranda, asked casually where the servants were located, adding that on the previous evening I had been unable to find any one.

The man glanced at me for a moment with, as I thought, a somewhat curious expression as he replied, 'None of them stay here at night; they all sleep over at the quarters.'

'That is a queer arrangement,' I remarked. 'At any rate, one of them came in late last night. I heard some one walk upstairs and along the gallery to the back.'

'Yes,' said Imbeaux, puffing vigorously; 'did you see anybody?'

'No; and the strange thing about it is, that though my bed is right opposite the window, and the moon was shining, I saw no one. Is the place supposed to be haunted?'

I said this laughingly; but Imbeaux looked a little embarrassed as, after some hesitation, he replied, 'Well, to tell the truth, there *is* some story of that kind; but before the coming of monsieur I used to sleep here, and certainly I never *saw* anything.'

'I don't suppose you did,' I said, with another laugh. 'What form is the ghost supposed to take?'

'No form; it is only heard. Old man Chaston was a bad master to his slaves—kept bloodhounds to hunt them; and my father, who was overseer here, has himself laid on three hundred lashes by the old man's order. He died without the rites of the Church, so he had to be buried in the garden. The negroes say he cannot rest, and that he walks at night along that gallery. For myself, I believe not in *revenants*, and when I first came here, thought soon to discover who walked; but at present I have not done so, although many times when that footstep has ascended the stairs I have jumped up and stood waiting.'

'But surely,' I exclaimed, 'you do not for a moment imagine that the footsteps I heard last night were supernatural?'

'As to that, monsieur, I say nothing; all I know is that *I* could never find out what caused them. They used to startle me a little at first, but at last I grew accustomed to them and took no notice, and so, doubtless, will monsieur.'

'I suppose old man Chaston was the former owner of Carondelet. Has he been in the habit of walking for the last twenty-five years?'

'It is only since Madame Chaston left that the negroes have said anything about it. The old man left the place jointly to his two sons, Auguste and Frédéric. M. Frédéric left the South, however, and settled in New York, where, people say, he made much money. He only came here occasionally. M. Auguste managed the plantation till the war broke out. He and his only son were killed at Gettysburg.'

'What became of his wife?'

'When the war was over and the blacks were set free, she just lived on here with a little girl she had adopted and old Phillis. How they contrived to exist God only knows. The Northerners had promised every negro three acres and a mule, and they were all too *exalté* to do any work, even if there had been money to pay them, which there was not. Carondelet, like almost all the other plantations, had been mortgaged far above its value, and in the first years after the war it was hopeless for the mortgagees to think of getting any money from the estates. Nearly all went out of cultivation; but their old owners, mostly women and children, stayed on in the houses and lived as best they could. Madame Chaston might have remained, but she was too proud to live on sufferance, so she took a few articles of furniture and moved into a small cottage at St Etienne. She died soon after.'

'But the other son, Frédéric, whom you say was rich, did he not assist the poor lady?'

'No; M. Frédéric forgot his birth, and became an officer in the Federal army. It was reported he was killed; at any rate he never answered when the curé wrote and asked him to do something for his daughter.'

'His daughter?'

'Yes. It was in this way. Madame Chaston had for a maid a beautiful Creole girl whom she brought with her one time when she went on a visit to St Augustine. Madame was very fond of her, and treated her more as a companion than a servant. M. Frédéric, when here on a visit, met and made love to her. I used often to see them walking together in the moonlight down there under the pecan-trees. Madame was angry, and told Dolores M. Frédéric was engaged to a young lady in New York, but she would not listen, and the week after M. Frédéric went back to the North she left Carondelet, and no one knew what had become of her. Madame Chaston fretted about her, and when, in a few months, she received a letter from the mother-superior of the Good Shepherd saying Dolores was in the convent dangerously ill, and imploring madame to come to her, she set off for New Orleans at once. She was too late to see Dolores alive; but she brought back and reared as her own the helpless infant, whom its mother had named Elodie, after her old mistress. As for M. Frédéric, he came no more to Carondelet. Two years after the war broke out'——

'What became of the child on Madame Chaston's death?'

'Pierre Dubois, who had formerly been valet to Monsieur Chaston, but had afterwards turned barber, tailor, what you will, took her, and the good nuns at Bon Secours educated her for nothing. She sings like an angel. Monsieur will hear her if he cares to attend mass at St Etienne on Sunday. It is only ten miles off, and the music is very fine; many strangers go to hear it.'

The following Sunday, not caring to pass the long day alone at Carondelet, I accompanied Imbeaux to mass. To the 'acts,' said in French by the officiating priest, I fear I paid but little attention; but when the low notes of the organ vibrated through the building, and an unseen choir of strings and voices burst into the Kyrie of one of Mozart's divine masses, I was as one entranced. Certainly Imbeaux had not overrated either the music or the lovely liquid soprano which, taking up the solo 'Christe Eleison,' thrilled through the church in tones of passionate entreaty. The same pure voice soared high above the others in the 'Gloria;' and when the last soft notes of 'Dona Nobis' died away it was as the awaking from a dream. All through the sermon my thoughts kept running on the tragic story of Dolores and her daughter. The voice which had so charmed me must belong to Elodie. I was impatient to see her, and on leaving begged Imbeaux to point her out. We missed her, however.

Returning by a somewhat different way, Imbeaux drew rein at the gate of a wooden cottage bearing a sign, 'Pierre Dubois, Tailleur et Perruquier.' He begged me to excuse him for a moment; he had business with M. Dubois. In a few minutes he returned, followed by an elderly Frenchman, who, with a polite bow, at once accosted me.

'Is it that monsieur wishes to return immediately? It is a long ride to Carondelet. Close by is a pleasant arbour. Would it not be well to wait until the sun declines a little?' He, M. Dubois, would be charmed if monsieur would condescend to taste his peaches.

I was hot and thirsty. I accepted, and followed my host through a well-kept garden to a large arbour furnished with table and cane lounging-chairs. Dubois produced some excellent cigars, and I was not sorry to postpone the long ride in the intense heat. Presently the garden-gate opened, the sound of a light footstep, the rustle of a dress, and from behind a clump of oleanders, with a startled look at the unexpected presence of strangers, appeared a lovely Creole girl of about sixteen, whom M. Dubois at once introduced as his daughter. After an elaborate curtsy to me she turned to greet Imbeaux, who gravely kissed her hand.

'Thou art late, Dédee; hasten, then, and prepare coffee. Afterwards thou canst gather some fruit for us.'

'*Oui, mon père.* Etienne Jumel is asking for thee.'

With a word of apology the old man hurried off, followed by Dédee.

'That, monsieur,' said Imbeaux, 'is Ma'amselle Elodie, of whom I spoke and with whose voice you were so well pleased. Dubois always calls her his daughter, and he and madame are good parents to her.'

Presently our host returned, followed by a negress bearing a tray with coffee and *galettes*.

I was disappointed. I had been hoping for the girl to return. Time passed; the evening shadows lengthened; it would soon be time to go.

Imbeaux was, he informed me, having some garments made, and with my permission he would like to have them fitted. He and Dubois disappeared, and I was left to stroll about the shady, perfumed garden. I longed to catch another glimpse of Elodie; nor was I disappointed. Emerging from a trellised alley, where the grapes were ripening on the vines, I saw her standing under some bananas, fastening a flower in the front of her dress. She did not notice me at first, and I had time to mark the lithe grace of her white-robed figure, the slender waist outlined by a scarlet ribbon, the wavy masses of her blue-black hair, and the long eyelashes that cast a shadow on her creamy cheek. Suddenly she looked up, her great, dark eyes met mine, and I saw the blood suffuse her face and neck. How I commenced a conversation I cannot now remember. I know I talked and Dédee for the most part listened, hazarding now and then some little remark in pretty broken English, her velvet eyes raised for a moment timidly to mine.

The others came back all too soon. We made our *adieux*, mounted, and set off for home.

I was, I fear, a poor companion, and profited little by the information Imbeaux bestowed upon me as to the cultivation of cane, for all the time I was planning as to how I should contrive to see Dédee again.

M. Dubois was a tailor; I discovered that my English clothes were unsuited to the climate. He was a barber also; my hair was much too long.

Before a fortnight had elapsed my outward man, thanks to the care of M. Dubois, had assumed a very French appearance. My object was accomplished. I made the acquaintance of madame and frequently I saw Dédee—not often alone, though. Creole etiquette was too strict for that. Yet sometimes madame and monsieur, seated in the arbour, would leave us free to wander in the garden, and here one evening, as the gorgeous tropic sunset drew towards its close, in the cool, tender twilight of the broad bananas where I saw her first, I told Dédee I loved her. She bent her head like a St Joseph's lily, the fair brow touched my shoulder, I breathed the perfume of the flowers in her breast, as in soft answer to a question she murmured very low, '*Je l'aime.*'

In the early spring Dédee and I were married, and went to spend our honeymoon in New Orleans. This was her first visit to the city, and her childish pleasure was delightful. I took her to the theatre, the opera, the churches. We visited the great French market and bought strange West Indian fruits, the very names of which possessed a kind of glamour; we joined the idlers in the streets at sunset and listened to the band between the rows of orange and magnolia trees, or from our rooms in the 'St Charles' looked down upon the crowd below. We were very happy; all was so new, so strange, so charming. Dédee looked forward with delight to once more living in her childhood's home, and when we stepped on board the steamer to return we were in the gayest spirits.

Although of late the papers had told of heavy rains in the far north which had raised the level of the river, I had paid little attention, and was surprised when one of my fellow-passengers told me that owing to the force of the swollen current it would probably be three days before we reached our destination. As we ascended I noticed that the water seemed to have risen almost to the top of the high levee, and occasionally on either side we saw bands of people strengthening the embankment.

It was midnight when we reached Carondelet, and a heavy rain was falling. The jetty was submerged, and it was with some difficulty we landed. Lights were moving all along the levee, and a little distance lower down a bonfire shed a lurid glow on the dark figures of a crowd of negroes who, with a sprinkling of white men from our own and the neighbouring plantations, were working with planks and shovels at the embankment. Imbeaux received us as we stepped on shore. He carried a lantern, and as he held it up we saw that he was only half-clothed and splashed from head to feet with mud. In answer to my eager questions he told me that, the river being so high, it was necessary to watch and strengthen the levee, which at the place where the men were working had showed signs of soakage. He for his part thought there was little danger; however, it was best to take precautions, and in case of a *crevasse* he had thought it best to send the negro women and children to the Carondelet mansion, which stood farther up the river than the quarters, and on slightly rising ground. The levee was reported strong for many miles above, and should the dreaded break take place the house would be safe. My heart sank within me as I listened. Of the damage done by the great floods on the Mississippi I was not ignorant, but until now I had not realised the danger. We hastened to the house. A group of dusky women and children were gathered in the veranda, some crying, some with camp-meeting fervour imploring the mercy of 'de Lor',' all evidently frightened, though not sufficiently so to prevent them from pressing forward to get a sight of the young 'mis',' whom many of them remembered as a child.

Dédee, though very pale, was calm; she strove to reassure the trembling blacks, and only for a

moment when I left to join the workers did she lose her self-control. I kissed her hurriedly, and, promising a quick return, hastened with Imbeaux to the river.

The rain had ceased, and the newly risen moon showed us the water almost on a level with the top of the embankment. The workers, tired out, were resting. No further leakage was reported; the weak place seemed to have been repaired effectually. Still no one thought of leaving. Imbeaux, at my suggestion, despatched a messenger to the house for coffee and refreshments, and pending their arrival all gathered in knots to discuss the danger.

Suddenly, with a loud crack, a portion of the wall gave way. All hands rushed to the place, and with desperate efforts strove to stop the fissure. Sand-bags were piled by willing hands against the aperture, but to no purpose. Slowly the crack widened; the sides seeming to crumble away gradually as the water, in ever-increasing volume, poured through. Further effort was useless. No power on earth could stop the torrent; our only thought was for self-preservation. Fortunately for us the levee on the right towards the house stood firm, and along this we hastened, while with a crash and roar some fifty yards of the embankment lower down gave way, and the turgid waters of the Mississippi surged over the plantation, carrying all before them.

The morning dawned upon a waste of waters. The house, indeed, was safe, but that was all. Right through the centre of the plantation rolled a mighty torrent. Quarters, cane-shed, and mill had all been carried away; the crops were ruined. The low-lying land which here slopes backward from the river was completely submerged; not an acre of cane in any stage whatever had escaped. My ruin was complete.

I pass over the time when the flood-waters were around us, and Carondelet was filled with homeless people. By degrees the blacks departed—some to other plantations, some to build cabins and make shift as best they could. For me, any hope of ever again working Carondelet was at an end. The money I possessed, when all was sold that could be sold, sufficed to pay all debts and leave a slender sum until such time as I should be able to gain employment. Leaving Dédee at St Etienne, I went to New Orleans, and there used every effort, but without success. After a month I returned and had a conversation with my wife as to our future plans. I was convinced that in the Southern States, not yet recovered from the exhaustion caused by the war, I had little chance; but in the great cities of the North things might be better. At first I thought of leaving Dédee with her foster-parents or the nuns of Bon Secours. To this, however, she would by no means consent. She had four hundred dollars of her own, earned before marriage by embroidery and teaching music; 'and if,' she said, smiling, 'I got pupils in St Etienne, where there are few people and all are very poor, I shall get many more in Philadelphia or New York.' My sweet Dédee! I listened to her prattle, but my heart was sore. The following week we settled to take passage to St Louis and thence to Philadelphia, where Imbeaux had already obtained employment in some capacity on the railway. His success had given me courage and decided me in favour of Philadelphia.

One night, owing perhaps to mental excitement, neither Dédee nor I could sleep. The moon shone brightly, as it had done when I arrived nearly a year ago, and once more upon the stairs and along the gallery sounded the same firm, measured footstep. I had heard it at intervals during the whole time of my residence, and though still unable to account for it, had almost ceased to notice it. Since Dédee came it had been silent. On hearing it she started up, listened, and clung tremblingly to me.

'It has gone to my old nursery,' she said.

'It—what?' I asked, with a forced laugh, fearing to frighten her. 'Phillis is promenading in my old boots.'

'That is not Phillis, Bertie; it is the *zambi*. We used to hear it long ago, but no one ever saw it. It does no harm; the good nuns say it is a wandering spirit condemned to bear its purgatory upon earth, and we should pray for it and not have fear; but, all the same, I have a little. The coloured people say it is the spirit of M. Paul Chaston. Have you not heard it before? M. Imbeaux told us that it walked as usual.' Further evasion was useless. I confessed to an acquaintance with the sound, and told Dédee that although I had been unable to find out what caused it, I was convinced it had no supernatural source.

Dédee, however, was incredulous, and murmured 'Ave Maria!' softly to herself. The mysterious footfalls were, I felt sure, due to some kind of echo; but to-night I noticed that instead of descending the lower stairs they had stopped short, and seemed to enter the end room, which, strange to say, I had never yet examined. The windows seemed securely shuttered, and, like the door and the balustrade, were overgrown by the tendrils of a creeping vine. The following morning we spoke of the strange foot, and both agreed that it had stopped at the closed door of what Dédee now told me had been her nursery. She remembered, she said, that before Madame Chaston went to live at St Etienne she had removed into it a good deal of her furniture, her piano, pictures, books, &c. No one since then had occupied the house save Imbeaux and myself, and it was probable the things were still intact. Nothing at that time was saleable, and madame had never claimed them.

No key was to be found; but, tearing away the creepers, I put my shoulder to the door and forced it open. A strange smell of mould and dust greeted my entrance. Spiders and cockroaches, undisturbed for years, scuttled away in all directions; swarms of moths rose from a decaying pile of carpets and bedding; and the strong Southern sunshine, entering through the door, showed that the place was filled with household furniture. Dédee, who

had entered with me, looked round and said, 'It is the garniture of madame.—Phillis'—to the old negress who stood beside her—'dost thou remember these things?'

'La sakes, yes, M'sel Dédee; it bin hyar dis ten year. Mas' Imbeaux gib ole mis' de key and tell her lebe it hyar. Dar her peanny and the lookin'-glasses, and dis yar de bes' bed all full ob dust an' mof.'

Dédee opened the long-closed piano, and the yellow keys gave out a jangling sound. I threw back the jalousies, and we all moved about examining. Great cobwebs shrouded the pictures and mirrors; the stuffing and brocade of the once handsome furniture crumbled beneath our touch; the costly hangings and carpets were a heap of rags. Some of the things, however, were uninjured; and Phillis having dusted them, we carried a few of the lighter articles into the gallery, amongst them being a tall Dresden vase. Looking inside it, I perceived a letter, and drawing it out, read on its yellow and mildewed cover the address of 'Madame Elodie Chaston, Carondelet Plantation, La.' Turning it over, I noticed that the large red seal was still unbroken, and a closer examination proved that, though the post-mark bore the date of eleven years ago, the letter had not been opened. I drew Dédee's attention to the circumstance, remarking on its strangeness, when Phillis, who had overheard, exclaimed, 'La! dat's de bery letter come for ole mis' de day Mas' Guste was killed; ole mis' she bery sick, 'peared like as if she'd die, so I jus' done put dat letter in de vase, an' sure 'nuf I clean forgot until dis day.'

Dédee broke the seal, and as she did so I heard the whistle of the steamer coming round the bend, and wishing to hail her, hurried off at once. When I returned Dédee met me in the veranda, looking pale and excited.

'Bertie,' she said, 'it is so strange; that letter was from M. Frédéric Chaston. It is about me. I am not sure I understand it rightly, but I think he writes to tell madame I am his daughter.'

'I have known it all along, dear,' I said, drawing her towards me; 'it makes no difference. Show me the letter.'

'There were two letters, Bertie, one inside the other; this one is in English, and I cannot read it well.'

I took the paper she held out, and saw, to my surprise, that it was the will, properly signed and witnessed, of Charles Frédéric Chaston, bequeathing to his beloved daughter Elodie the whole of his property, and appointing as guardians Madame Chaston and General Beaumé; while attached to it by a drop of wax was a certificate of marriage of C. F. Chaston and Maria Dolores Gomez. The other letter, in French, was from Frédéric Chaston to his sister-in-law. In it he told her that Dolores and he had been married in New Orleans, he at the time believing her to be a slave. In the eyes of the law such a marriage was, as he well knew, invalid. Subsequent inquiry proved, however, that poor Dolores really was, as she persistently stated, a Spanish Creole of untainted lineage, and as such a lawful wife. M. Frédéric being at that time engaged to a Northern heiress then on a visit to Europe, such a discovery was, as he naïvely confessed, awkward in the extreme. Having obtained from Dolores a promise that for the present at least their marriage should be kept secret, he established her under a feigned name in New Orleans, and returned north to extricate himself from his difficulty as best he could.

This was no easy matter. The betrothal had been made public; the lady's father was prepared to advance money for a speculation by which M. Frédéric hoped to obtain wealth. The relations with whom his fiancée was travelling prolonged their tour, and M. Frédéric, like the villain he undoubtedly was, deferred breaking off his engagement with Miss S. During this time he wrote to and supplied Dolores with money, and of the reasons which led to her taking refuge with the nuns of the Good Shepherd he professed complete ignorance. Madame Chaston's letter informing him of her death, and indignantly reproaching him, showed a way, as he said, out of his embarrassments. Dolores had kept his secret; he would not reveal it. His sister-in-law having the child, it was in good hands; he was in no haste to claim it. Her letter remained unanswered. M. Frédéric's Northern friends knew nothing of his Southern marriage, and he of course did not enlighten them. In the end, the girl he was to marry jilted him; but his speculation was successful: he was rich. Many times, he wrote, he had thought of doing justice to his child, and to-night, upon the eve of a battle which might be fatal to him, he had made his will and written to Madame Chaston the confession which would vindicate the name of poor Dolores.

I have little more to add. The General Beaumé mentioned as trustee was living in New Orleans, and rendered all assistance. The strangely discovered will was valid, and in due time Dédee came into the possession of a considerable fortune. Her foster-parents, needless to say, had no cause to complain of her ingratitude. In the beautiful French cemetery of New Orleans is a white marble cross erected to the memory of 'Dolores, wife of Frédéric Chaston, erected by her loving daughter Elodie.'

The old plantation-house is, I believe, yet standing; but whether the mysterious footfalls are still heard in the gallery I know not, for Dédee and I have long since made our home in England. Dédee is a good Catholic, and still prays for the vanished spirit, maintaining that to its agency we owe the revelation of the secret of Carondelet.

THE MONTH: SCIENCE AND ARTS.

FIGHTING BY TELEPHONE.

WHEN Dr Graham Bell produced that wonder of the nineteenth century, now so familiarly known to us as the telephone, he could hardly have anticipated the varied uses to which the instrument can be put. Quite apart from its commercial and social importance as a means of communication, it is one of the most sensitive detectors of feeble currents of electricity yet known, and is highly valued in the physical laboratories of the world for this reason. But perhaps the most unlooked-for service it is rendering is its help in warfare. It has remained for the ingenious Japanese to show how the most mighty conflict ever known—with a frontage of about one hundred miles, in a country so flat that usual means of signalling are not available—can be directed from headquarters by telephone. It is as if the vast battle area were provided with a nervous system of extraordinary sensitiveness, which yields up its impressions to one grand centre where the human ear waits to listen to the messages, and to profit by them.

THE RECOVERY OF TIN FROM OLD CANISTERS.

It would hardly be thought worth while to attempt to recover from old tin canisters and tin-plate waste generally the thin coating of the white metal which is so firmly attached to the sheet-iron that it can only be removed by electrical means. Yet in Germany alone no fewer than thirty-five thousand tons of tin scrap are treated annually with this object in view. From 2 to 2½ per cent. of pure tin can be recovered from the tin-plate treated, which represents no less than eight hundred tons. The details of the work are jealously guarded by the proprietors of the factories, for there are many who are eager to enter upon even this apparently unprofitable enterprise. Roughly, however, the method employed is as follows. The tin scrap to be dealt with is placed in an electrolytic bath, the electrolyte being caustic soda. One pole of the electric supply is connected to the mass of waste material, and the other pole to a suitable electrode also immersed in the solution. In a few minutes the passage of the electric current tears from the thin sheet-iron every particle of the tin with which it is coated, and this can afterwards be recovered from the bath and used over again.

FISH FOR THE DOGGER.

We have heard much of recent years of the stocking of inland and river waters with valuable fish from distant localities, and much interest is at the present moment being aroused as to the possibility of once more turning the historic Thames into a salmon-stream. But the notion of replenishing the sea with live-stock seems to be one so fraught with difficulties that it is almost utopian. However, an experiment in this direction is now being made by some British naturalists at the famous fishing-grounds off our east coast, which were recently the scene of Russian naval activity. The idea is to bring shiploads of live plaice from other parts of the North Sea, and to dump them on the Dogger Bank—to make, in short, this famous fishing-ground a nursery from which can be filled the gaps made by the greedy trawlers. The results of the experiment cannot be made plain for a long time to come, and even then it will be next to impossible to say whether any increase in the supply of plaice is due to this or natural causes.

A WEATHER-LORE EXHIBITION.

More interest is now being aroused by weather-forecasting than ever before, and the reason is that the art has lately been brought to a very high degree of perfection. Like most mundane things, it went through the usual stages of incredulity and ridicule; but now it is established on such a firm basis that the laugh is altogether on the other side. Weather-forecasting has indeed advanced sufficiently in public estimation to make previous scoffers turn round and ask, 'How is it done?' and an exhibition recently opened at the Institution of Civil Engineers, London, has been designed to give them the necessary information by means of instruments, charts, drawings, and photographs. Here is the kite which was used to carry meteorological instruments skyward during the Scottish Antarctic Expedition, with the appliances employed by the officers of the *Discovery*. Among these is the world's record sunshine measurement—a chart into which the sun burnt a continuous line for three consecutive periods of twenty-four hours. One of the most popular exhibits is a series of photographs showing the effects of the vagaries of lightning on buildings, trees, animals, and human beings.

THE LARYNGOSCOPE.

Signor Manuel Garcia, the eminent singing-maestro, who recently celebrated his one hundredth birthday, has the credit of inventing the laryngoscope, or throat-mirror, which has proved of such signal service to the physician. In his younger days Signor Garcia took up the study of anatomy, and made many experiments with the breathing apparatus of different animals. But in his later years his great desire was to watch the action of the vocal chords, and he finally adopted the device of a tiny mirror set at an angle on a rod to insert in the mouth, while a second mirror outside reflected the image of the larynx. Of late years all kinds of surgical instruments have been much improved, especially those for exploiting the cavities of the body; while the possibility of introducing an electric glow-lamp in a glass bulb as small as a pea

has naturally caused many of the older instruments to be superseded. Still, it is interesting to note that the idea of the laryngoscope came not from a surgeon, but from a teacher of singing, who was scientific enough in his methods to seek information from the fountain-head.

RADIO-ACTIVITY OF MINERAL SPRINGS.

It has been found that various mineral springs exhibit a certain degree of radio-activity due to the presence of radium or some other similarly radio-active substance. At the time when radium was hailed by enthusiasts in its turn as the future cure for cancer and other malignant complaints, for which it is only human to search eagerly for means of relief, it was said that the undoubted curative properties of these springs might be due to that fact. Experiments have recently been conducted with the water of the hot springs in Wiesbaden, and it has been found that the property of radio-activity largely disappears on boiling the water so as to dispel the gas which it contains. A large number of hot mineral springs in France have also been examined, and it has been found that helium was among the gases of them all. Some of the springs were, however, found to contain much more than the others.

IS THE EARTH'S HEAT DUE TO RADIUM?

Among the many astounding qualities attributed to radium, one of the most remarkable is its apparent power of continually giving out heat without appreciable loss to itself. Professor Mark Rutherford calculates that a pound of this precious mineral would emit in the course of a year as much heat as could be obtained from the burning of one hundred pounds of the best coal, and at the end of that time the radium would still be practically unchanged, and probably capable of doing the same work for a thousand years more. Radium and other radio-active matter continually evolving heat are found in minute quantities throughout the crust of the earth; and Professor Rutherford comes to the remarkable conclusion that even the small traces which have been found point to the existence of a sufficient quantity to account for terrestrial warmth. To do this involves the presence in the crust of the earth of about two hundred and seventy million tons of radium. Immense as is this amount in proportion to the few grains which have so far been isolated, it in reality corresponds to only one part in twenty million million uniformly distributed; and the observations of Elster and Geitel of the radio-activity of soils point to the presence of about this proportion.

COPPER SULPHATE AND THE GERMS OF DISEASE.

The destruction of algæ or scum in water by the addition of a very minute quantity of copper sulphate or blue-stone has already been mentioned in these columns. A minute trace of this chemical in water, while totally destroying these low forms of vegetable life, does not interfere with the growth of higher forms of plant-life, such as watercress. It is thought that this is due to the fact that the former plants are unicellular, and are, therefore, attacked in their entirety and killed; while the more complex multicellular organisms escape by the distribution of the poison among the numerous cells. Bacterial life—probably for the same reason, for bacteria are unicellular vegetable organisms—succumbs to the action of extremely dilute copper sulphate, although not quite as readily as the algæ. The micro-organisms of cholera and typhoid present in water have been destroyed in three or four hours by the addition of one part of copper to every one hundred thousand parts—a proportion far too small to have any effect whatever on man or other higher forms of life. If the germs of these deadly diseases can be themselves slain by a poison administered in such infinitesimal doses as to be absolutely innocuous to the human system, is there not ground for hope that this simple chemical may prove in this connection a very valuable addition to the resources of medicine?

A NEW ELECTRIC GLOW-LAMP.

For some time past experiments have been conducted with a view to finding a metal which would be suitable for the manufacture of filaments for incandescent electric lamps in place of the carbon threads at present used. Various metals, such as vanadium and niobium, whose melting-point is considerably over two thousand degrees centigrade, were dealt with, and finally tantalum was selected as being the most suitable. After various experiments, tantalum powder was melted in vacuo to free it from the residual gases, and then manufactured into a very fine wire. It was found that to get the greatest efficiency in a lamp suitable for use on a one hundred and ten volt circuit, the wire filament would have to be over twenty-five inches long, and in order to contain this in the glass bulb recourse was had to a peculiar device. In the new lamp the centre of the globe is occupied by a short pillar of glass, into the upper end of which are fused a number of separate wires much in the form of the frame of an umbrella which has been blown inside out. A similar arrangement the other way up is formed in the lower end of the central pillar, and between the extremities of these wire spokes the thin filament of tantalum is zigzagged. The lamp is said to give twice the efficiency of the ordinary carbon filament, and its advent upon the market will be waited with considerable interest.

THE SAFETY OF SUBMARINES.

The recent lamentable accident to the submarine *A 5*, by which several men lost their lives, has drawn attention to the great danger which accompanies the employment of petrol in places where good ventilation cannot be obtained. There are many means of producing the explosive gas for internal-combustion motors; but petrol furnishes one of the

easiest, because it spontaneously gives off the inflammable vapour without the employment of heat or other special aid. For this very reason it is one of the most dangerous to use, and a small leakage of the liquid means the production of a large volume of gas, which may probably lead to a very serious explosion. Small explosions have frequently occurred on submarines, but have not previously been attended with loss of life. Alcohol is not open to this objection in anything like the same degree, and it is nearly as efficient as petrol. In France, where spirit is cheap, it is largely used for motor-cars, and gives very satisfactory results. The terrible abuse of alcohol by the incontinent has necessitated the restrictions which at present so seriously limit its legitimate use in many industries; but now that explosion-engines bid fair to oust all others for a great number of important purposes, some other way may perhaps be found of overcoming this difficulty. Men who are brave enough to voluntarily face the perils of life in a submarine boat should not be exposed to any danger which can reasonably be avoided. The substitution for petrol of some less volatile fluid may be recommended to the serious consideration of the Admiralty. If, through the warning given by this accident, it ultimately becomes practicable to use alcohol in all cases where petrol or gasoline is now employed, the men who lost their lives on the *A 5* will not have died in vain.

SOPHISTICATED BOOTS.

A report has been published in Melbourne by the Victorian Agent-General in London, to the effect that the British War Office has rejected large quantities of Australian leather owing to the fact of its being adulterated with weighting material. He states that leather chemically treated so as to add to its weight has been on the market for some time past. Barium chloride, which costs in quantities about one penny per pound, can be worked into a side of leather to the extent of about five pounds; and as leather sells at from eightpence to tenpence per pound, it will be seen that the gain to the unscrupulous tanner is very considerable. The unfortunate wearer of boots made from this material is probably better off than he would be if paper entered largely into the composition of the soles; but certainly the conditions of life are not improved when unnecessary weight has to be carried about without any corresponding gain in strength or durability. Besides, there is no guarantee that paper is not used in combination with this weighted leather, just as it might be with the unadulterated article.

FLOUR WHITENED BY ELECTRICITY.

A new electric process for whitening flour has recently been introduced in Paris, and Monsieur Baland has examined some specimens of flour so treated. Analytical experiments show that in the flour treated by this method the wheat-oil is partially converted into fatty acids, and consequently the aroma and flavour of the flour are depreciated. There is also a 30 per cent. increase in acidity. The process is described as being essentially an artificial aging or whitening.

PLANT-BREEDING.

Mr Luther Burbank, according to a writer in the *Century* for March 1905, has succeeded in 'creating' new forms of plant-life: of fruits, nuts, and flowers. Since 1893 he has sold a large and flourishing nursery business that he might give his whole time to plant-breeding at Santa Rosa, California. There is a cactus plant which he has made thornless, adaptable to any climate, and which now yields a delicious fruit, which may be eaten raw or cooked, and the leaves preserved in the same way as ginger or melon rinds. He has a bramble, too, without thorns; and a brilliant crimson poppy has been made from a yellow one. The shell of the walnut has been thickened; the 'plumcot' is a combination of the American wild-plum and a Japanese plum, and he has a rhubarb which yields every day in the year. There is also an improved prune, a 'pomato' (which is a tomato grown upon a potato), and a white bramble. Mr Burbank, from long study and intuition, seems to read plants like human beings, and chooses those which can be successfully fertilised and crossed. At Sebastopol he has now growing three hundred thousand distinct varieties of plums, thousands of peaches, nectarines, cherries, almonds, and grapes, with myriads of other fruits and flowers. It is difficult to describe how this is all done by means of cross-pollination and selection, the instrument being a watch-crystal or a small saucer, and the finger-tips are used to take the pollen, which has been dusted on the crystal, and place it on the stigma. The public will only want some assurance that the flavours have been improved and not destroyed in these wonderful processes.

THE OLD CHURCH BY THE SEA.

High on the bleak and barren down,
Where salt winds wander free,
The gray old church o'erlooks the town,
The old church by the sea.
And ever through the people's pray'r,
And through the preacher's tones,
There comes the sigh of the briny air,
And the ocean's restless moans.

Above the swelling organ-strain,
When the northern tempests roar,
Is the angry surge of the mighty main
As it beats against the shore.
Ever and ever, murmuring nigh,
Is the sound of the washing sea,
And over the people's pray'r and cry
The voice of eternity.

THE DOUBLE ANEMONE.

By M. HARDY.

PART I.

MISS CATHERINE SCOTT entered the drawing-room of the Belle Vue Hotel and glanced quickly round it. Her eye alighted on a lady who was sitting comfortably in an arm-chair reading, and she smiled. Then, with the aid of one of the many mirrors, she composed her expression into a grim frown, and stepped briskly across the room.

'I have a bone to pick with you, Amelia.'

Mrs Hinton looked deprecatingly over the top of her book.

'You needn't explain what it is, Kitty. I can read it in your eye. It's because I introduced you to that poor young man at *table-d'hôte*.'

'I'm glad you have a conscience. Whatever made you do it?'

'I don't see that it mattered. He was sitting next you; and he was bound to speak to you, anyhow.'

'Now, Amelia, that's wriggling—disgraceful wriggling! If he had spoken without an introduction I could have frozen, couldn't I? But I couldn't turn into an icicle when I had just been introduced.'

'I am very sorry, my dear. But you seemed to get on excellently. You were chattering all dinner like a pair of magpies.'

'Well, if magpies have the same difficulty in keeping up a conversation as I had, I am sorry for them. In sheer politeness, I was bound to say something; so I tried him on theatres. He had never been to one. He didn't care for pictures or music. He didn't dance; he didn't skate; he hadn't ever heard of a toboggan. At last, by the merest fluke, I hit on wild flowers. He is devoted to wild flowers; so, out of pure good-nature, I pretended I was too. But it was an awful strain.'

'Well, I'm very much obliged to you, Kitty. He's some sort of connection of mine: second-cousin to my brother's wife, I believe. Laura wrote and asked me to be kind to him, and I thought I couldn't do better than introduce him to you.'

Miss Scott shook her head at the implied compliment.

'You are terribly insincere, Amelia,' she said. 'Three days ago you told me you were only too thankful the Cartwrights were leaving, because I was such a dangerous companion for their young male child.'

'I was only speaking from Mrs Cartwright's point of view, my dear. Archibald Kent—I think Laura said his name was Archibald—looks far too old to have any anxious parent.'

'Then you had better take the post,' said Miss Scott.

Mrs Hinton, construing this last remark as a reflection on her age, retired, offended, to her book.

While the two ladies were discussing him in the drawing-room, Archibald Kent was sitting in the smoking-room, blinking his eyes and coughing at the cloud of smoke which from time to time a neighbour blew into his face. Kent was not himself a smoker. He had only come into the smoking-room because the neighbour at his side had volunteered to show him the way. Now that he was there, he was longing to get out. But he stayed for fear his neighbour should notice his departure and take offence. If only he could find a good excuse! He had a morbid dread that if he rose without one, his neighbour, who at present was not paying the smallest attention to him, would suddenly take an interest, and ask him why he moved.

Presently his neighbour dropped his paper on the floor and began to doze. Kent, keeping a guilty watch upon him, got up and took one step towards the door. His neighbour's eyes opened, and rolled sleepily towards him. Immediately Kent fell into a panic, shifted first one foot, then the other, and finally dropped back into his chair again.

'Cramp?' asked his neighbour, working himself into a more upright position in his chair.

[*All Rights Reserved.*]

'No,' said Kent; 'I don't think so.'

'Ah, fidgets!' said the other. 'I get 'em myself sometimes. It's these confounded native wines.'

Kent had never in his life drunk anything stronger than water; but he suffered the odium of his fidgets to lie where it fell. His neighbour, warming to the topic, sat up a little higher.

'It's the same in all these confounded little Swiss hotels. Not a drop of liquor fit to drink; and if you bring in your own, there's a king's ransom to pay by way of corkage.'

Kent nodded politely. He would have liked to ask the meaning of 'corkage,' but refrained, for fear his ignorance might seem unpardonable.

'I have been a bit of a traveller in my time,' continued his neighbour; 'and in my humble opinion, though I know most other people don't share it, there's nothing like one of our big English hotels for solid comfort in the commissariat.'

'Do you think so?' said Kent.

'Don't you?'

Kent hesitated. 'I really don't know,' he said.

'Well, which do you reckon the most A1 hotel, bar none, you've ever stopped in?'

A faint blush crept over Kent's sallow face.

'As a matter of fact,' he said, 'I—er—to-night is the first time I have ever been in one.'

His neighbour sat himself bolt upright with a jerk.

'You're rotting!' he said.

'No, it's a fact. I have never been in one before in my life.'

His neighbour stared at him with interest.

'You'll excuse my saying it, but, for a man of your age and position, I should think you're pretty well unique. Bless me! I couldn't have been more surprised if you'd said you'd never been to school.'

The blush on Kent's face deepened. His neighbour marked it.

'Don't tell me you haven't been to school either.'

'I'm afraid I haven't. I was taught at home.'

'Well, I suppose your parents knew best. But'—— An expressive shrug of the shoulders finished the sentence. 'I never went to college; the provision trade was more in my line than higher education. But I did go to school—a jolly good school, too, where they whopped you, and gave you a meat-dinner in the middle of the day, for five-pound-ten a quarter.'

Conversation languished for a time, while the smoker puffed contentedly at the stump of his cigar. That finished, he drew out his case, and, before lighting another, offered the case to Kent.

'Thanks very much, but I don't smoke,' said Kent.

'Humph! I wonder you like the smell of it, then.'

'I don't particularly,' confessed Kent.

The other looked at him, and laid his cigar down unlighted.

'Here, I say, Mr'——

'Kent is my name.'

'Mine's Higgins—J. B. Higgins. I beg your pardon, Mr Kent. I've brought you to the wrong room. I expect the drawing-room was what you were looking for.'

Kent flushed.

'No offence meant,' said Higgins hastily. 'I should be there myself if it weren't for the nicotine. There are a couple of very pleasant women there most times. I don't suppose they'd take much notice of me if I weren't the only man in the hotel, besides the waiters, who speaks their tongue. But that being so, they're jolly affable. You come along, and I'll introduce you.'

'If you mean Mrs Hinton and Miss Scott, I have been introduced already.'

'Oh, that's all right, then. You can just drift in on your own.'

Kent rose with alacrity.

'Turn to the left, first door on the right,' directed Higgins, and he resumed his paper.

Ten minutes later he awoke from a snooze to find Kent standing dejectedly before him.

'Couldn't you find it?' he asked.

'Yes, I found it all right.'

'You don't mean to say they turned you out?'

'I didn't go in. I—well, the truth is, when I got to the door it occurred to me that perhaps I had no right to enter without an invitation. You see, I'm not used to hotels.'

Higgins exploded in a loud burst of laughter.

'Well, you're the most modest man I've met. I don't meet many. But if you're shy, I'll give you something that'll see you through.'

He searched in his pocket, and produced a card, on which he scribbled, 'Please admit bearer. —J. B. H.'

Kent received it gratefully.

'It's awfully good of you,' he said.

Thoughtfully regarding the card, he walked across the room and out of the door. But scarcely had the door shut behind him when it opened again, and he poked his head in.

'Ought I to knock?' he asked.

'Not unless you intend to masquerade as a comic waiter.'

'Thanks very much. I didn't know,' said Kent humbly.

As he walked to the drawing-room he endeavoured to prime himself with a subject of conversation. He need not have troubled. As the light fell on his timid face framed in the open doorway, Mrs Hinton positively screamed at him:

'Now this is too kind of you, Mr Kent, to take pity on two lonely women! We were getting so tired of one another's society—weren't we, Kitty?'

Miss Scott was sitting sufficiently close to her friend to tread reprovingly on her toe. She was in the middle of a very interesting novel. But politeness compelled some sort of greeting to the intruder.

'Have you come from the smoking-room, Mr Kent?' she asked.

'Yes,' said Kent, advancing hesitatingly into the

middle of the room, and fidgeting with Higgins's card, uncertain of the right moment to present it.

'Mr Higgins there?' inquired Miss Scott.

'Yes,' said Kent.

'I am sure he offered you a cigar?'

'Yes,' said Kent, wondering whether either of the ladies would offer him a chair, or whether he ought to take one uninvited.

'I thought he would. The first night he arrived he offered one to Amelia.'

'Oh Kitty! how can you say such a thing? He never did anything of the sort.'

'It's quite true, Mr Kent. He took his case out of his pocket and poked it under Mrs Hinton's nose. "Do either of you ladies go in for weeds?" he asked. You should have seen the poor man's look of surprise when Amelia rapped out, "Excuse me, sir; I'm not a widow."'

'Don't you believe a word, Mr Kent. Kitty is much too fond of telling stories.'

'I prefer reading them,' said Miss Scott, fingering the pages of her book suggestively.

'Please don't let me interrupt you,' said Kent.

His tone and look were so plaintively apologetic that Miss Scott felt remorseful. She had not intended her remark to be appreciated in any further quarter than her friend Amelia.

'Won't you sit down?' she said. 'All the seats are free.'

Kent let Higgins's card slip to the bottom of his waistcoat-pocket, and took a chair.

'We English are a wonderfully reserved nation; aren't we, Amelia?'

Kent, with the exhilarating consciousness of being a bold adventurer, rose from his chair by the door and took the seat left vacant on the sofa. He sat very forward on it. Miss Scott revived an interest in her novel.

'Do you play bridge, Mr Kent?' asked Mrs Hinton.

She had been rummaging in her small-talk cupboard for a likely topic, and had seized the question in a moment of despair. But no one except an intimate friend could have guessed that fact.

'I am afraid I don't quite know what it is. Is it an indoor game?'

Mrs Hinton gasped, and looked at Miss Scott, uncertain whether to giggle or to cry. Miss Scott, to her friend's astonishment, shut up her book with a sudden bang.

'Yes, it is an indoor game,' she said, 'played with stiff bits of paper called playing-cards.—Come, Amelia, we'll teach him.'

Mrs Hinton stared at her helplessly. She suspected that the proposition sprang less from charity towards Kent than from a desire to retaliate on herself for introducing him.

'Wouldn't you prefer to play "Beggar my neighbour" with Mr Kent, Kitty? It's an easier game to teach. Besides, we are only three.'

'I think we'll play bridge,' said Miss Scott firmly.

To the surprise of all, Kent proved himself an apt learner. Miss Scott had started to play with the idea that two or three hands would be quite sufficient teasing for Mrs Hinton. But her pupil did such credit to her teaching that she played on for the game's sake. At the end of the second rubber, when the party broke up for the evening, she felt called upon to shake him by the hand and say, 'I'm very glad indeed you came in, Mr Kent.'

Kent blushed, and was so confused that he forgot to thank her for the lesson.

'Amelia,' said Miss Scott, as she and Mrs Hinton sat sunning themselves on the veranda next morning, 'as there is absolutely nobody in Hundehof, I intend to give up pleasure and go in for education.'

'Dear me, Kitty, what are you going to learn? Political economy?'

'No, Amelia. How silly you are! I'm not going to educate myself. I'm twenty-five, and I should hope that by now I am a sufficiently finished article. I'm going to educate your brother's cousin-in-law.'

'Isn't he finished too? He's thirty if he's a day.'

'I look upon him as a child in long clothes, Amelia.'

Miss Scott began her education of Archibald Kent in a curious way. She professed a desire to learn all about wild flowers. Very timorously he hinted that the best way to learn was to go out on to the mountain and collect them, in company with some one who could explain. Miss Scott's head drifted slightly to one side as she looked at him.

'There isn't anybody I can ask,' she said. 'Amelia is as ignorant as I am, and I don't fancy Mr Higgins would be much good.'

Kent hesitated. He was by no means insensible to the charm of Miss Scott's appearance and the novelty of her manners and conversation; but he was uncertain whether the offer of his company might not be improper, and lay him open to a snub. He hesitated so long that Miss Scott grew impatient.

'I taught you bridge,' she said reproachfully.

And before he had fully framed his application, Kent found himself installed in the vacant post.

In the course of the next few days Miss Scott learned a good deal about wild flowers. It was spring, and the lower mountain-slopes were covered with furry anemones, oxlips, primulas, and early gentians. Higher up among the rocks were rarer specimens, which she would never have seen at all had not Kent been with her. In return for his information she taught him a thousand things.

'Really, Amelia,' she confided to her friend, 'his innocence is positively awe-inspiring. Sometimes, when I am talking to him, a puzzled expression creeps into his eyes that makes me feel like a ballet-girl strolling into a Quakers' meeting-house. You can't think how easily shocked he is.'

Mrs Hinton's memory recalled a flippant remark of her own the night before.

'Oh yes, I can,' she said.

'If his brains were as simple as his soul I could

understand it. But do you know, Amelia, that he is astonishingly clever. Mr Higgins has found out that he is the author of two scientific books which are more original and more difficult to understand than anything else that has been published in the last ten years. What do you think of that, Amelia?'

'It's a pity that he is so plain,' said Mrs Hinton.

'I don't think he's plain at all,' said Miss Scott coldly. 'His eyes are beautiful.'

Mrs Hinton looked alarmed.

'I hope you haven't been talking nonsense to him, Kitty. Because, if you have, it's most unfair. Please remember that I am responsible to my sister-in-law, and that you mustn't trifle with that young man's feelings.'

Miss Scott assumed a deeply injured look.

'Have you ever known me trifle with anybody's feelings but my own?'

'Yes,' said Mrs Hinton severely; 'lots. That Cartwright boy's, for instance.'

'Nonsense! The Cartwright boy was too young to have any feelings. I was only educating him.'

'Well, please don't educate Archibald Kent into a similar condition of volcanic misery. Have you told him you're engaged?'

'No, of course not. I don't go about like a notice-board, crying, "Trespassers will be prosecuted." He can see for himself that I wear a ring on my third finger.'

'Humph! Much though I love you, Kitty, I don't trust you. I believe you take that ring off occasionally.'

Miss Scott poured a torrent of indignant protest into Mrs Hinton's suspicious ear till she was stopped by the church clock striking.

'Oh, I must be off,' she said. 'I am keeping him waiting.'

'"Him" being Mr Kent, I suppose?'

'Yes,' said Miss Scott defiantly. 'We're going up the Kleineralp to look for a double anemone.'

'I hope you won't find something that you're not looking for; that's all I can say, Kitty.'

At that moment Kent appeared. His manner of approaching them, Mrs Hinton noticed, was much less diffident than it had been a week before. He could now stand quite comfortably on both legs.

'I am quite ready,' said Miss Scott.—'Good-bye, Amelia.'

With a defiant nod she set out on her walk, determined to show her contempt for Mrs Hinton's charges by especial graciousness to Kent. Kent, however, was in a thoughtful mood, and met her sprightliness rather slowly. She decided to stir him up.

'Poor Amelia seems rather lonely. Would you mind if we brought her with us?'

He stopped in the middle of the road and looked at her. For a minute she thought that he was going to take her at her word and turn back for Mrs Hinton, and it piqued her to think that her education should have done so little. A minute later, however, she feared her education had done too much.

'I should mind,' was all he said in words. But his look and tone said more.

For some time they walked on in silence, and in silence they left the road and began to mount the grassy slopes at the base of the Kleineralp. Miss Scott found the silence oppressive. With a feeling as if she were turning a dangerous conversation, she remarked, 'I do hope we come across a double anemone to-day. I have set my heart on finding one.'

'I have set my heart on getting it for you,' he said.

The words were innocent enough; but Miss Scott's conscience gave them an inner meaning. She took her gloves off. He was watching her attentively.

'Shall I put them in my pocket?' he asked.

She dangled them in her left hand. The glaring Hundehof sun sent a thousand colours glancing through the diamond in her ring. But he did not notice it. He took the gloves, folded them tenderly, and put them in his pocket. Then they continued the climb.

'I want to find a double anemone and give it you myself. Can you guess why?' he asked.

They had halted on a ridge of the mountain, and were gazing down at the village of Hundehof five hundred feet below. The houses were little more than blue-and-yellow specks dotted round the spire of the Lutheran church. Miss Scott eyed the steepness of the smooth, green slope, and wondered whether she would break her neck if she started to run home.

Kent was apparently encouraged by her silence.

'It's a symbol,' he said.

Miss Scott's mind groped wildly for the flippancy which was her usual weapon of defence. But nothing flippant could she find. Unwillingly she maintained the encouragement of silence.

'The night before last I had a dream. I dreamt I was hunting for a double anemone. I found one, and gave it to you; and then—then you gave me something in return. I confess I am superstitious over dreams. When I woke up I determined that the moment of finding the double anemone I would make the moment for speaking out what's in my mind.'

'What an interesting dream! You can't think how flattered I feel at being an actor in it. But to change to a less romantic subject, don't you think it's time we were going home?'

'No, no; not just yet. I want to speak to you.'

'Hadn't you better wait till you have found your anemone, Mr Kent?'

He shook his head. Again she tried to warn him; but the movement of her left hand was misinterpreted.

'I'm not saying good-bye, Mr Kent. And if I were, my hand doesn't need both of yours to hold it. It's not so heavy as all that.'

'Please listen to me, Kitty.'

'That's my Christian name, Mr Kent. I think,

if you don't mind, we'll stick to surnames. They are just as easy, and much more dignified.'

He seemed quite unconscious of the rebuff. He still held her hand. The alarming thought occurred to her that, in his slow and deliberate way, he was making ready to kiss it.

'I must trouble you to let go my hand, Mr Kent. Charles would not like your holding it.'

'Who's Charles? What does Charles matter?'

'If you let go my hand I'll tell you.'

Reluctantly he dropped it. She looked at him, half-frightened, half-triumphant, at the completeness of his education.

'Charles gave me the ring,' she said.

'Is Charles your brother?'

She shook her head. There was no room for flippant evasion now.

'He is my young man—my betrothed.'

Though speaking in the easiest tone at her command, she had found it necessary to turn her head away, and to become absorbed in contemplation of the view. Exactly how he took the news she could not see. She had feared an outburst of reproach. But the prolonged silence that ensued was even more embarrassing.

At length Kent broke it. His slow, matter-of-fact tone gave no clue to the state of his feelings.

'I beg your pardon. Did you say you were betrothed?'

'Oh yes. Didn't you know? I have been engaged to Charles Meredith for nearly a year.'

The sound of her own voice so far reassured her that she managed to turn round. She found Kent looking at her intently, with a somewhat puzzled expression on his face.

'I suppose you thought I knew?' he said.

She skirted a direct answer.

'Well, I wear an engagement-ring, you see.'

'And it never occurred to you that I shouldn't understand?'

Why would he persist in asking awkward questions? She objected to telling untruths. Besides, she really wasn't quite sure what she had thought, or whether she had ever thought at all.

'I don't know,' she said. But only the 'know' was audible.

'No, no, of course; you would never have dreamt of it. Anybody but a poor ignorant fool like me would have understood everything long ago.'

Miss Scott experienced the novel and unpleasant sensation of feeling extremely mean. She was very thankful when, on the hotel veranda, the walk ended, and she was free to rush to Mrs Hinton's room and unbosom her iniquities. Tragically she threw herself into the nearest arm-chair.

'You were quite right, Amelia.'

'You don't mean to say that my poor relative has gone and done it?'

'Well, we had to have an explanation. He took it awfully well; and I feel about as mean as Mrs Cartwright's sham pearl. In fact, I'm so dreadfully penitent that I'm going to wire to Charles to come and comfort me.'

'Poor Charles! Poor Archibald Kent!' said Mrs Hinton.

(To be continued.)

AN OLD-WORLD SCOTTISH SERVICE MEMBER.

By the Rev. CANON TETLEY.

CHARLES LAMB tells us, in his essay *My Relations*, that his cousin Bridget Elia—that is, his sister Mary—'was tumbled early, by accident or design,' into a library 'of good old English reading, and browsed at will upon that fair and wholesome pasturage.' The books were those of their kind friend the Bencher Samuel Salt; and the room must indeed have been, as my delightful friend the late Master of the Temple wrote, 'a blessed resource for them in face of the monotony and other discomforts of their home, and against more serious evils.' It is scarcely probable that a similar experience befell any of my readers in their childhood, but some at least no doubt have shared the writer's pleasure in roaming at will among the books and the annals of an ancestral home. What a treasure-house of manifold contents is the dwelling where many generations have lived their lives! Not only the books that tell the taste of successive owners; but, much more than these, the long-forgotten romance, the episode once so full of incident and force, that stirred so strongly the individuals concerned, and to which now the clue is lacking, the records of sorrow and of joy, the triumph and the tragedy alike: there they lie in dust and oblivion till a descendant or an antiquary comes across them in his quest. In such wise, this last summer, while with my kinsfolk in their Highland home, I lighted on the diaries which form the basis of what is written here.

Their author, Sir Andrew Leith-Hay, M.P. for the Elgin Burghs from 1833 to 1847, with an interval of three years during which he was Governor of Bermuda, was the son of a most distinguished Scottish soldier, General Leith-Hay of Leith Hall, by Mary, co-heiress of Charles Forbes of Ballogie. The gallantry and skill of the father were a legacy of undying honour to his descendants. Sir Andrew served throughout the Peninsular war, of which he wrote an excellent History. 'The father,' it was said in the lifetime of both, 'is worthy of the son, and the son of the father.'

Only two volumes, unfortunately, survive. The earlier pages of one are filled with extracts from authors to whom he had evidently devoted a great

deal of time and attention. Every entry, I may mention, from earlier life until the close, is made in that beautifully formed and clear handwriting which might so often be imitated with obvious advantage by the present generation. The other is chiefly a record of parliamentary work during the session of 1833—Mr Gladstone's first session, by the way.

The extracts to which I allude are from the *Mémoires* of Cardinal de Retz, Gibbon, a variety of writers concerning the Dukes of Buckingham, Swift, Cardinal Dubois, and Schlegel. After these there comes a sketch of that extraordinary career which had recently closed at St Helena, and had in its course so deeply affected the writer's own life; and much besides, closing with an extract from Dr Chalmers bearing date of 14th March 1829. Then begin the miscellaneous entries from which I proceed to make a brief selection.

'Lines on reading in the newspapers that Lord John Russell's health has been seriously impaired by his anxiety and fatigue in carrying through the Reform Bill.' By the way, they were certainly not the composition of our compiler, a sturdy Whig and the son of one who bore the title of 'the Patriarch of Liberalism' north of the Tweed:

> 'Jack and Will brought in a Bill
> To create a Revolution.
> Will fell down and broke his crown,
> And Jack his constitution.'

The next entry runs thus:

'I recollect Sheridan's play of *The Rivals* cast as follows at Drury Lane Theatre:

Sir Anthony Absolute	KING.
Captain Absolute	JOHN PALMER.
Acres	BANNISTER.
Faulkland	JOHN KEMBLE.
Sir Lucius O'Trigger	R. PALMER.
Julia	Mrs SIDDONS.
Mrs Malaprop	Miss POPE.
Lydia Languish	Mrs JORDAN.

A combination of histrionic talent never in all probability to be again equalled.'

The following page stands in tragic contrast. It records the death of Sir Andrew's second daughter, and gives a sketch of her short life, ending pathetically:

'The testimony of a father to the dawning virtues of his child may be as worthy of the consideration of the best portion of mankind as the eulogium on the conqueror, the statesman, or the lawgiver who has attained pre-eminence and fame by subjecting to his purposes the best and noblest feelings of our nature.'

Death was busy in his household, for the next entry to this is of another daughter's removal, concluding with a notice that reads strangely to our modern ideas:

'Upon Thursday, Aug. 22nd, 1833, dear Mary was laid in the vault belonging to the Parish of St George, Hanover Square.'

Turning over various pages, the contents of which would be not devoid of interest to Aberdeenshire readers, but for which it is impossible to find space, I come to the following:

'After the battle of Waterloo, Sir Walter Scott published a poem entitled *The Field of Waterloo*, when the following lines appeared in the periodicals of the day:

> Of all the gallant heroes slain
> On Waterloo's ensanguined plain,
> None by sabre or by shot
> Fell half so flat as Walter Scott.

To which Lord Erskine added the following:

> Though none before with spear or shield
> E'er fought so well on Flodden Field.'

The page that faces this reminds us how very far the world has travelled since the writer's days:

'During my life it has been my fate to be called upon to act as a friend in affairs of honour, and I have as a second settled disputes between the following parties without ever permitting recourse to arms:

Lord Kintore and Mr Dowbiggen.
General Ramsay and Major Hunter.
Mr Farquharson of Finzian and Mr James of Ballogie.
Mr Farquharson and Sir John Barnett.
Lord Palmerston and Colonel Sibthorp.
Mr Grantly Berkeley and the Mayor of Bristol.
Capt. L. Bulkeley and Col. Cecil Forrester.
With many others.'

An honourable record indeed, surpassing his boldest deeds on the battlefield.

And so we pass on till the day comes when, in the evening of his life, the brave old soldier tells how his Devonshire bride of long ago, Mary Margaret Clark of Buckland Toussaints, passes from this lower scene, and is laid in the strange old graveyard at Kennethmont, beneath which the Great North of Scotland Railway runs. The end was near now. There is only one entry after this. The instinct of the old sportsman leads him to tell:

'*July* 2, 1859.—This afternoon a trout was found dead in the pond at Leith Hall, weighing six and a quarter pounds.'

The measurements follow, and with them the book is done.

I turn now to the pages that are for the most part parliamentary. It will be of interest to my readers to know that they are part of a substantial volume of information representing, in fact, the *Whitaker* of those days. On 4th February 1833 we have the first entry on a sheet of fine quality which has retained its whiteness all these seventy years: 'I took my seat in the House of Commons.' It is highly characteristic of the period when coaching was at its zenith that almost his earliest business is to 'call on the Duke of Richmond on the subject of mail-guardship for Mr Forrester of Banff. Promised the first vacancy.' The postal service accounts for a good deal of his attention, and there is a constant stream of petitions, political calls, dinners, committees, and obtaining places for constituents besides. There is a touch of humanity

and humour in the following: 'Received letter from the Duke of Richmond on the subject of mail dining at Elgin going south.' With a significance little to be apprehended then, a neighbouring entry runs: 'Committee on Birmingham and London Railway three o'clock.' And here is an early murmur of the storm that burst ten years after: 'Received petition from Elgin against Lay Patronage.' On 7th May he writes: 'Saw Mr Phillips, Under-Secretary of State, on the subject of Newlands, sentenced to death at Inverness;' and on the 11th, 'Received respite; forwarded the same to Elgin.' Thus briefly he records one of the first movements in what was destined to become an enterprise of vast importance: 'National Provincial Bank.—Articles of co-partnership read and altered, June 15, 1833.' Meetings follow rather frequently after this—daily, indeed, towards the close of the year; the member for the Elgin Burghs being evidently much occupied by the business on hand. On 13th August the committee of management meet for the first time, 'Mr Barnes, Mr Farrer, Mr Joplin, Mr Remington, and myself.' Again his strenuous work is interrupted by the illness and death of a daughter, the pathetic entry of a 'pair' being duly made.

All through this volume the name of Lord Althorp is constantly recurring. And here I am able, by a happy stroke of fortune, to tell again, after the lapse of two generations, a story of the soldier-member's chivalry towards his political ally. I found it in a volume called *Random Recollections of the House of Commons, by One of no Party, 1836*, on which I lighted in my rovings:

'At the Meeting of the Session of 1834, Colonel Leith-Hay did one of the noblest things I ever witnessed. On the second night of that Session, when the question was about to be solved which of the Irish Members (as affirmed by Mr Hill, Member for Hull) had played the traitor by admitting, while he violently opposed the Coercion Bill, that that measure was indispensably necessary for the peace of Ireland, and that he only opposed it to please his Constituents—on that occasion, when Lord Althorp was badgered by Mr Shiel to give up his authority for the statement, and when Mr Shiel plainly intimated to his Lordship that if he did not give the name of his informant he would hold him personally responsible, Colonel Leith-Hay rose up, and in the most energetic yet dignified manner said, addressing himself to Mr Shiel, that precisely the same statement as that made to Lord Althorp had been communicated to him, and that he would not, any more than the noble Lord, give up his authority, but would hold himself personally responsible. I never yet knew anything produce a greater effect on the House. There was not an honourable Member in it but deeply felt for Lord Althorp at the time, and when they saw him in a great measure relieved from the embarrassing situation in which his refusal to betray the confidence reposed in him by a friend had placed him, by the generous and well-timed interposition on the part of the gallant Colonel, a murmur of suppressed admiration of the conduct of the latter was heard in every part of the House, and was with difficulty repressed even by the strangers in the Gallery.'

And here my gleanings cease. Times are changed indeed since our old-world Scottish service member travelled to and from the House by the Scottish mail. But the staunchness of principle, the unflagging industry, the unshaken courage, the tenderness of heart withal, made up a character which in every age is of priceless worth, and of which the nation was never more in urgent need than she is at this moment, when from their long-forgotten place these records of a bygone day once more have seen the light.

GIANT CIRCUMSTANCE.

By JOHN OXENHAM, Author of *Barbe of Grand Bayou, Bondman Free, John of Gerisau*, &c.

CHAPTER XXII.—CLEANING SLATES.

WHEN Geoffrey Carrick looked out of his bedroom window next morning it was still snowing, though not so relentlessly as on the previous day. The sky above the great white waste was lighter, the wind had fallen, and the bit of sea visible from his window looked like a sheet of lead.

He dressed again in his borrowed plumes, since his own clothes were evidently not yet fully dried; but when he opened his door he found them in a neatly folded pile outside. Miss Lesley and Colin got up from their usual crouching-place by the fire as he stood in the doorway for a moment, and his face showed his appreciation of the charming picture they made. The long low windows on two sides of the room, looking south-west and west, showed Nature outside at her whitest and coldest—the white plain of the snow, the leaden plain of the sea, the feathery flakes falling slowly and packing on the sills. And inside, by contrast, all the tones were rich and dark and warm: the large oil paintings, the dark curtains to the doorways, the solid old furniture, the friendly books on the walls, the black-and-tan collie, and—crown jewel of them all!—the beautiful dark girl, with the glow of the blazing fire in her hair and in her eyes and in her face, still tuned to warmest friendliness.

'I hope I have not kept you waiting?' he said. 'My watch stopped at five minutes past

twelve yesterday morning and declined to go on again.'

'There was no hurry,' she said. 'I hope you slept well?'

'I slept like a top, thank you.'

'And the foot?'

'I think it's going down a bit, but it is not much good yet. It seems to me it is not snowing quite so heavily. Does it often behave like this on Innismohr?'

'I never saw it so bad in my life before. The back of the house is buried. But the wind is changing, and it will go as quickly as it came.'

He had enjoyed beyond words their friendliness of the evening. They had slipped into it by degrees as matters between them unfolded, and he quite appreciated the fact that, under the stress of unusual emotion, she might have been unconsciously led into the display of more feeling than was customary with her. He was quite prepared for some return on her part to a not unnatural reserve —to what, indeed, was probably her natural state. But she was as frank and cordial as before, and his heart rejoiced the more to find her so.

His thoughts had naturally been full of her. He had fallen asleep thinking of her, and wondering dreamily at her prompt and full acceptance of all he had told her. And when he woke his first thoughts had been towards her. He craved sight of her again, for, strangely enough, the beautiful face was less distinct to him in its new friendliness than the scornful dark eyes had been in their hostility. And when they met, his eyes had sought hers anxiously for sign of reserve or withdrawal on her part. But the large, dark eyes were full of friendliness, and held neither reservations nor withdrawals, and he was glad.

And if he had thought much about her, not less she concerning him. She was no simple Highland girl to be imposed upon by any glib beguilement. Before the deluge the family had had a house in Edinburgh, and spent part of each year there. She had visited London more than once, and had passed two years in Germany. But, above and beyond all that, she was possessed of a strong, healthy brain, and had been taught to use it; and she had a large and lofty soul, widened and deepened by much close contact with Nature, and a loyal heart which readily recognised truth and uprightness in others. She was satisfied that these things were equally in Geoffrey Carrick, and, once satisfied, she held him friend.

Perhaps it was, to some extent, this sudden acquittal of her from what he had feared that made her seem even more charming than before. She was housekeeper again in her large white apron, and wholly sweet and beautiful, with the added charm of knowledge, strength, and usefulness—applied beauty in its most wholesome form.

As she passed quickly into the kitchen to serve the waiting breakfast, Carrick sank into his chair before the fire with a little sigh—half content, half something else. For he could not but remember that this delightful state of affairs was only temporary and dependent on the state of the weather, and there was within him already, and almost unconsciously, a desire for its continuance. And at his sigh Colin looked up at him knowingly, as much as to say, 'That's so. She *is* nice, isn't she?' and then, in response to a friendly rub on the head, stood up with his paws on Carrick's knees and licked his face.

'Can you eat porridge without milk?' she asked, as she set out three plates on the table.

'I'm quite sure I can. It looks delicious.'

'You could have some whisky,' she suggested. 'Some people take it so.'

'I wouldn't spoil the taste of it for anything. I am quite sure it needs no whisky or anything else.'

'Oh yes, it is very much better with milk, but I have none.'

He would have found it good even if it had been smoked, and the coffee and bacon and crisp oatcakes which followed were excellent. Never in all his life had he enjoyed a breakfast so much.

Truly, I feel for him, mere scribe as I am, at thought of his losing it all so soon. Perhaps it was the certainty of its evanescence that accentuated all his enjoyment of that simple, most delightful meal.

How keen the enjoyment, mental as well as physical, of the guests at those ancient poison-banquets! What a fine and final point to every tight-strung perception and discrimination both of mind and body, the thought of that approaching bowl which should snap the golden cord and end all tastes and time! Let us eat, drink, and be merry, for presently we die!

But that is a fool-cry after all; and Geoffrey Carrick, if his enjoyment was quickened by thought of coming loss, was anything but a fool. He would eat, drink, and be merry, but he had no intention of dying, either literally or metaphorically. There was, in fact, growing within him a very strong desire for continuance, or at all events renewal, of this new and great enjoyment, and somewhere deep down inside him a seed of deliberate intention that way.

One thing, however, weighed upon him. Three indictments she had brought against him in justification of her unjustifiable ill-will. Two of these he had rebutted and reduced to nothing. The third remained importunate. By paying but bare valuation for Innismohr he had unwittingly deprived Miss Cameron and her mother of the slender livelihood which would still have rendered them independent. That she recognised his innocence of intention, and exonerated him from blame, and had cast it all behind her, served only to accentuate his feeling in the matter.

Yet how to right the unintentional wrong? He would have given much to know, and more, very much more, to accomplish it.

And when, after breakfast, she introduced him to her bookshelves, and betook herself to her household

duties, he chose a book and sat and smoked, but brooded over this matter more than he read.

And presently she was standing at the side-window looking out over the sea, and telling him that the wind was certainly changing, which was no joyful news to him. And then she took up some sewing and sat down before the fire, and began to question him about the Soudan again; and, before he knew it, he was discussing it all with her as he might have done with Nell.

She had a quick apprehension, and in this matter a long-unsatisfied curiosity; and her deft questioning drew from him, bit by bit, pretty nearly all the facts concerning himself and the death of George Eisenach and the fight at Tembé.

'You have made me talk of these things as I have not talked to any one but my own people,' he said. 'But I am just as glad that you should know the whole matter. In return, I crave a favour.'

She looked contemplatively across at him.

'Will you grant it?'

'Certainly not until I hear what it is.'

She waited for him to explain, and he found it difficult to begin.

'You have acquitted the prisoner on two counts,' he said, with an attempt at light disguisement of his feeling. 'But there still remains one on which he pleads guilty, though without intention.'

'Then he cannot be guilty,' she said quickly.

'Unfortunately the wrong remains, or its results, and he will know no peace of mind till it is righted. But he is only common clay, and he has no idea how to do it without offence.'

'I know what you mean. From your point of view you did what you believed right, and what, I suppose, was right. If you had known all the facts no doubt you would have done differently.'

'I most certainly would. I would like to do differently now.'

'You cannot do anything now,' she said decisively, and went on with her work.

'Not even if, by doing nothing, I am left with a gaping wound?' he asked earnestly.

'Time heals all wounds,' she said didactically.

'It is so much easier to be philosophic when you are the wounder and not the wounded.'

'I dealt no wound.'

'You are doing so now. Besides, you stabbed me with your eyes for three months on end.'

But she would not admit it, and tried to change the subject. He was not so easily turned from his purpose, however.

'You have made me discuss myself quite beyond my custom. Now let us discuss your affairs for a few minutes.'

'I would very much sooner you didn't.'

'But I very much wish to.'

'We can find many more cheerful subjects.'

'Only if you persist in being self-willed and unreasonable about it.'

She was thoughtful for a moment, and then said, with a smile lurking in the corners of her eyes and mouth, 'Well, proceed. But don't cry for help if you get under the ice.'

'Well,' he began briskly, 'here's how matters stand. Through no fault or grace of my own, but through the kindness of a dear old man, I have a great deal more money than I know what to do with. Through no fault of their own, the mother and sister of my dearest friend are left but poorly provided for. Quite unintentionally I deprive them of a sum of money which would be useful to them. Incidentally the young lady saves my life'——

'And dries your clothes and makes your porridge.'

'The most delicious porridge I ever tasted. But, as I said, that was incidental, and perhaps should not come in. If I had known the facts it is quite certain I would never have done as I did. As soon as I learn them I am sorry, and would get back and make amends.'

He waited, but she offered no help.

'What I would very much like to do now would be to do what I would have done if I had known the facts, and'—he got red in the face when it came to the point, but went on doggedly—'place to Mrs Cameron's credit in the bank the sum that I quite unwittingly deprived her of.'

He had a lurking fear that she might rise up splendidly, and scorch him with her eyes, and sweep out of the room. But she was much too sensible, and she gauged fully the good-will that lay behind the impossible suggestion.

'And would it be for conscience-money, or for drying your clothes, or making your porridge?' she asked. 'You see it is impossible. We have no kind of claim upon your'——

'Oh, but you have. If it comes to claims, where should I be now but for you?'

'Well, where you are: a bit under water,' she said quaintly. 'No, we can't get back, and we cannot accept your money. The future may lighten for us. I am very much afraid that for my dear mother it will lighten upwards; but we are both prepared for that, and she has no great wish to stay, except on my account.'

'And yourself?'

'I think I can always earn a living, and perhaps the necessity for it will be useful.'

'Earn a living! How?' he asked.

'Music—violin. They credit me with a certain facility, and I love it dearly. Now,' she jumped up, 'I must cast an eye on my cooking;' and he sat looking into the fire and smoking thoughtfully.

'All the same,' he began when she had resumed her seat and her work, 'I wish very much'——

'Please, don't begin it again! It is quite out of the question. Let us talk of something else;' and wisdom was vouchsafed him not to press the matter any further just then.

He drew her on to talk of the island and the people, and she gave him many curious sidelights into matters which would be of use to him. And more than once she seemed on the point of telling

him other things, and then suddenly checked herself and went off at a tangent.

He had been questioning her about the old mine-shaft, and asking if she had ever ventured inside it, and she had acknowledged that she had.

'Will you cut the timber at all?' she asked.

'Not more than is necessary for thinning purposes.'

'I am so glad. We had to, you know, and every tree they felled was a fresh pang to me. I hope you will replant the slides too.'

'Do you know, I have had two curious experiences in that beautiful glen at the foot of the lake,' he said.

'Oh! What were they?'

'Twice, when I have been going down it, I have had the curious impression of a face—a dark, surprised man's face, I think—looking up at me from below. But when I hurried down and searched for it, it was gone, and I could find nothing to account for it. Has anything of the kind ever happened to you?'

'No; I don't think so. The people about here are mostly dark-faced; but if there had been any one there you would surely have found him. Perhaps you have a very vivid imagination.'

'I never had any to speak of, as far as I know. But if any place could kindle one's imagination, it is this island of Innismohr. What with its kelpies, and its wood-nymphs, and its bottomless lake, and its Spanish blood, it is an island of mysteries. There's another curious bit I want to look into sometime—that green, table-topped rock at the head of a tiny bay on the way to Innisrath. Can you tell me anything about it?'

She gave him one quick, startled look; but he was gazing into the fire and did not see it.

'They say the top of the cliff slipped down long ago, hundreds of years ago, and has been there ever since,' she said quietly.

'Yes, that's what it looks like. And it's probably all honeycombed with the waves. I was standing on it the other day, and could hear them rumbling inside it.'

'And you went on to Innisrath?'

'Yes; Tom Brading and I had lunch there, and then walked on down the east coast, and over the hills to the loch, and home round the head. By the way, we met a curious fellow there—a foreigner, I should say—going along towards Innisrath. He seemed, somehow, out of place in a Scottish island. Who would he be, do you suppose?'

'There is a very curious old bond between Innismohr and Spain, she said quietly and with a touch of reserve. 'It is said that one of the Armada ships came ashore here, and that the races got mixed. We frequently see Spanish sailors here.'

'What on earth do they come for?'

'To visit their distant relations perhaps. But they seem quiet and inoffensive, and we have never had any trouble with them.'

For the first time since they had become properly acquainted, Carrick got the impression that she could have told him more if she had wished to. But he had a vague apprehension of the clannish nature and of the primitive codes of honour that prevailed among the Highlanders; and a moment's consideration suggested that there might be trifling matters of business between these foreigners and the natives which it would be as well not to inquire too closely into. If Miss Cameron was aware of them, or suspected them, the very last thing she would dream of doing would be to discuss them with an outsider; and his own feelings fully approved her attitude.

(To be continued.)

NOTES ON MEMORY.

By J. Cater, M.D.

Memory comprises the twofold process of conservation and reproduction. The former is the essential element of memory, because without a storage of thoughts and events reproduction is impossible. As impressions reach the brain, if they are to be re-collected they must be organically registered. They must be fixed there in some way ready for future use; and the means by which this registration is accomplished constitutes the all-important question for consideration.

The latter process, that of reproduction, is readily comprehended when once the mechanism of conservation has been satisfactorily explained.
